Wright, William Henry, Canadian industrialist and publisher (b. Sleaford, Lincs., Eng., April 21, 1876—d. Barrie, Ont., Sept. 20, 1951), served in the British army in South Africa during the Boer war. He returned to England after the war, but in 1907 went to Canada, and in 1911 discovered a rich vein of gold in northern Ontario. With a capital of $10 each he and a brother-in-law staked claims on which were founded the Lake Shore mines that by mid-century had paid $98,000,000 in dividends. Wright enlisted in the army in World War I. In the 1930s he bought the *Toronto Globe* and the *Mail and Empire*, merging the papers into the *Toronto Globe and Mail.* He was reputedly one of the wealthiest men in the British Commonwealth.

Xenopoulos, Grigorios, Greek dramatist (b. Constantinople, Turk., Dec. 9, 1867—d. Athens, Gr., Jan. 15, 1951).

Yahuda, Abraham Shalom E., orientalist and biblical scholar (b. Jerusalem, Palestine, June 18, 1877—d. Saratoga Springs, N.Y., Aug. 13, 1951).

Yancey, Jimmy, U.S. pianist (d. Chicago, Ill., Sept. 17, 1951), was believed to be in his sixties, since he had appeared in 1910 as an eccentric dancer in a command performance before King Edward VII of England. He quit the entertainment field to play baseball while continuing to play piano in bars at night. He evolved the boogie-woogie bass, the rumbling continuous style that formed one of the bases of modern jazz. His fortunes alternately soared and fell, and almost simultaneously his music was being played by big-name bands while he was working as a groundkeeper in a Chicago baseball park. He appeared in a comeback performance at Carnegie Hall in New York city as late as 1948.

Yarborough, Barton, U.S. actor, radio and television star (b. Goldthwaite, Tex., Oct. 2, 1900—d. Burbank, Calif., Dec. 19, 1951).

Yefremov, Alexander Ilarionovich, Soviet politician of Russian nationality (b. Moscow, Russia, April 23, 1904—d. Moscow, U.S.S.R., Nov. 23, 1951).

Zeder, Fred Morrell, U.S. industrialist (b. Bay City, Mich., March 19, 1886—d. Miami, Fla., Feb. 24, 1951).

Zeleny, John, U.S. physicist (b. Racine, Wis., March 26, 1872—d. New Haven, Conn., June 19, 1951).

Zook, George Frederick, U.S. educator (b. Ft. Scott, Kan., April 22, 1885—d. Arlington, Va., Aug. 17, 1951).

Oceanography.

A study of all available temperature data from the Gulf Stream area between Cape Hatteras and the Grand Banks had indicated that the main current is usually bordered by weak countercurrents and that from Georges Bank eastward a second warm easterly current forms near the continental slope so that there are at least two warm currents passing the southern extremity of the Grand Banks. During the summer of 1951, this was confirmed by a five-month survey of the research vessel "Albatross III," and it was shown that east of the Grand Banks additional new bands of swift and relatively warm currents form inshore, parallel with the older ones. In all, four and possibly five distinct warm currents, separated by countercurrents, were located as the Gulf Stream system was followed eastward across the North Atlantic as far as longitude 23° W. To this point at least, the narrow bands of current were found to follow meandering courses, as had previously been shown to be the case in the sector south of Nova Scotia. This entirely new picture of the character of the upper layer of the Gulf Stream system was as yet unexplained; however, it was evident that the broad pattern of water motions resembled the so-called jet streams of the upper atmosphere.

Marked seasonal fluctuations in the surface current speeds of the Gulf Stream system were noted. Maximum speeds were found in the southern sectors during the summer and in the northern ones during the winter. In autumn minimum speeds exist throughout the entire system.

A number of deep-sea expeditions continued to stress geological investigations. The modern, closely spaced soundings showed many areas of bold relief rising above practically level planes. Off the west coast of Florida, a steep escarpment, dropping 4,000 ft. at a 35° angle along a distance of about 200 mi., was charted by ships of the U.S. coast and geodetic survey and the Woods Hole Oceanographic institution. It was suggested that Florida is structurally a part of the Caribbean area. Other major features were found in the Pacific ocean by vessels of the U.S. navy electronics laboratory and the Scripps Institution of Oceanography. The broad, level planes in some ocean basins were thought to be produced by turbidity currents, originating on the continental slopes and flowing close to the bottom with sufficient velocity so as to carry large quantities of material, even sand, hundreds of miles out into the deepest areas which are thus being gradually filled in. Only by some such periodic and violent phenomenon can the layers of sand found in many deep-sea sediment cores be adequately explained. As a result of recent sediment coring and seismic investigations, it was evident that the generally accepted theories of sedimentation and submarine geology required extensive revision.

A growing awareness that science in general has much to gain from oceanographic explorations was indicated by many papers in meteorology, fisheries biology and marine engineering, and by the large sale in the United States of a popular book entitled *The Sea Around Us.*

At the end of 1951 the British R.R.S. "Discovery II" and the Danish vessel "Galathea" were still at sea on extensive voyages. The "Discovery," besides continuing the prewar investigation of antarctic waters, had been studying the Benguela current and the whale distribution off South Africa, while the "Galathea" was on a world-wide cruise to obtain ocean life from the greatest depths. The continuing growth of the science was indicated by the establishment of a National Institute of Oceanography in Great Britain and of new oceanographic departments at universities in Egypt and the United States. (*See* also Coast and Geodetic Survey, U.S.; Marine Biology.)

(C. O'D. I.)

Odría, Manuel A.

(1897–), president of Peru, was born in Tarma, state of Junín, Nov. 26, and was graduated from the School of Officers at Chorrillos in 1919, remaining there on the teaching staff until he reached the rank of captain. He next studied at the War college and at the Advanced Naval school, and in 1936 was promoted to lieutenant colonel. He saw action in the conflict with Ecuador over the boundary between the two countries, and was promoted to the rank of full colonel. He served as director of the War college, and visited the U.S. at the invitation of that country. In 1946 he was made brigadier general and appointed chief of staff of the army, and in 1947 was appointed minister of government and police, but resigned from that post in disagreement with the policies of the president. The republic next was confronted with internal troubles, including a leftist rebellion. In late Oct. 1948, Gen. Odría became head of the restoration, assuming the presidency of the military government, with the objectives of re-establishing order, reorganizing economy and finance, re-establishing freedom of commerce, improving social welfare and promoting public education. He resigned to enter his candidacy for the constitutional election, and on July 2, 1950, was elected president of Peru for the 1950–56 term.

Ohio. A north central state of the United States, popularly known as the "Buckeye state," Ohio officially became a state of the union on Feb. 19, 1803. Area: 41,222 sq.mi., including 222 sq.mi. of water; pop. (1950 census): 7,946,627, including 5,578,274 urban and 2,368,353 rural. The principal cities and their 1950 population figures are: Cleveland 914,808, Cincinnati 503,998, Columbus 375,901, Toledo 303,616, Akron 274,605, Dayton 243,872, Youngstown 168,330, Canton 116,912.

History.—When the Republican-controlled 99th Ohio general assembly met in Jan. 1951, Gov. Frank J. Lausche (Dem.) presented 33 suggestions in a 9,000-word condition of the state message. Subsequently 670 bills were introduced in the house of representatives for an all-time record. The general assembly before it adjourned *sine die* June 20: passed the first congressional redistricting act in 38 years; passed a bill making an estimated increase of $25,700,000 in the school subsidy; overrode a veto on a bill giving local governments $3,100,000 to compensate for deficiencies in the state's matching of poor relief funds; passed an antipollution bill setting up a board with broad powers to control dumping of sewage and industrial wastes into Ohio streams; passed a bill strengthening the sales tax law; killed in committee a bill to permit construction across the state of a belt to convey iron ore and coal; passed a motorists' financial responsibility act.

A special session of the general assembly in December revised the turnpike law to remove objections of investors because the law formerly would have caused long delays in the acquisition of condemned right-of-way property. The Ohio supreme court had upheld the constitutionality of the Ohio Turnpike commission in March.

State officers in 1951 were: governor, Frank J. Lausche (Dem.); lieutenant governor, George D. Nye (Dem.); secretary of state, Ted W. Brown (Rep.); auditor, Joseph T. Ferguson (Dem.); treasurer, Roger W. Tracy (Rep.); attorney general, C. William O'Neill (Rep.).

Education.—In 1951 the state had 3,029 elementary schools with a total enrolment of 781,883 and a teaching staff of 24,985, and 1,196 secondary schools with an enrolment of 410,177 and a teaching staff of 18,816. State expenditures on education in 1951 were $244,628,652. In the 1951 elections voters approved 146 out of 170 school bond proposals in the state for a total of $89,196,000. The state director of education in 1951 was Clyde Hissong.

Social Insurance and Assistance, Public Welfare and Related Programs.—The average number of recipients of general relief in Ohio in 1951 was 24,964 and the total assistance extended (December estimated in each case) was $15,291,203. The average number receiving aid for the disabled, a relief program that was begun in Oct. 1951, was 2,722 and they received $1,418,156; aid for the aged, 119,955 cases, received a total of $66,349,716; aid to dependent children, 14,412 cases, received a total of $12,613,650; aid to the blind, 3,832 cases, received a total of $2,096,929. Benefits paid by the Ohio bureau of unemployment compensation in 1951 totalled $28,418,000 (December data estimated) in compensation for 1,378,000 weeks of unemployment. The state had a labour force of about 3,200,000 and the bureau estimated that in Nov. 1951 3,100,000 of them had jobs.

Table I.—*Leading Agricultural Products of Ohio*

Crop	1951	1950	Average 1940–49
Corn, bu..	169,536,000	174,928,000	169,584,000
Wheat, bu..	34,308,000	46,596,000	46,592,000

Barley, bu.	494,000	728,000	769,000
Rye, bu.	288,000	528,000	800,000
Buckwheat, bu.	209,000	270,000	316,000
Popcorn, lb.	22,680,000	24,000,000	24,036,000
Hay, tons	3,916,000	3,701,000	3,722,000
Soybeans, bu..	21,356,000	24,525,000	18,552,000
Tobacco, lb.	24,555,000	24,610,000	24,361,000
Sugar beets, tons	126,000	277,000	258,000
Maple syrup, gal.	130,000	149,000	180,000
Apples, bu..	4,400,000	3,534,000	3,598,000
Peaches, bu.	1,044,000	927,000	878,000
Pears, bu.	234,000	205,000	274,000
Grapes, tons	19,400	22,400	14,900
Potatoes, bu.	5,750,000	7,650,000	7,731,000
Truck crops, commercial, for fresh market, tons.	81,000	92,600	104,300
Truck crops, commercial, for processing, tons	245,200	217,800	259,100

Ohio's four established penal institutions had an average daily population of 9,107 for the fiscal year ended June 30, 1951. Two industrial schools had an average daily population of 984. The Marion training school was opened in Nov. 1950 to train and rehabilitate younger, more promising men who had been found guilty of violating criminal laws. Its average daily population for the fiscal year was 65. Two new receiving hospitals for mentally ill children were opened, one at Dayton and the other at Cincinnati. The total operating costs of all welfare department institutions in the fiscal year 1951 were $29,840,747.

Communications.—Ohio had 86,286 mi. of highways in 1951, outside of municipalities. Of this total, 16,076 mi. were classified as rural, 29,093 mi. as county and 41,116 mi. as township. Total state expenditures on highways in the 1951 fiscal year were $85,923,817. The state had 8,424 mi. of railroads in 1951.

Banking and Finance.—There were 420 state and private banks in Ohio with deposits (June 30, 1951) of $4,221,371,999 and resources of $4,607,649,299. There were 239 national banks in the state with deposits (Oct. 10, 1951) of $3,839,526,000 and resources of $4,127,393,000. State chartered savings and loan institutions numbered 476 with total resources (June 30, 1951) of $1,428,694,325. There were 132 federal savings and loan associations with total assets (estimated as of Dec. 31, 1951) of $774,626,095.

The state budget for the 1952–53 biennium was $729,000,000. There was a net cash balance of $55,670,928 in the state treasury on Sept. 30, 1951. It is unconstitutional for the state to have a debt except for $200,000,000 for a soldiers' bonus for which special provision was made by a constitutional amendment.

Agriculture.—In spite of some damage from late summer drought and an unexpectedly early winter, Ohio agriculture in 1951 experienced one of its most productive and profitable years. Total harvested acreage of principal crops was 10,611,000 ac., compared with 10,534,000 ac. in 1950

Table II.—*Principal Industries of Ohio*

	Valued added by manufacture 1950	Valued added by manufacture 1949
Food and kindred products.	$476,568,000	$509,037,000
Tobacco manufactures.	11,334,000	9,790,000
Textile mill products	62,956,000	48,948,000
Apparel and related products	128,892,000	131,568,000
Furniture and fixtures	141,523,000	154,421,000
Paper and allied products	262,990,000	195,378,000
Printing and publishing industries	361,088,000	344,833,000
Chemicals and allied products	416,558,000	348,211,000
Petroleum and coal products	152,941,000	109,935,000
Rubber products	498,501,000	353,453,000

Other minerals		?		2,081,719
Total		?		$242,079,831

*Values for processed materials are not included in the totals.

and an average for 1940–49 of 10,410,000 ac. Livestock accounted for $652,689,000; crops for $231,686,000 of the total receipts of $884,375,000 from farm marketings through Oct. 1951; the 1950 total for the same months was $743,575,000. Farm land dollar value increased 19% between Nov. 1950 and Nov. 1951.

Manufacturing.—The total value added by manufacture in Ohio in 1950 was $7,967,482,000, compared with $6,412,895,000 in 1949, according to the census of manufactures made by the bureau of the census of the United States department of commerce. The average number of production workers in 1950 was 1,167,117, compared with 1,078,746 in 1949, and they were paid wages totalling $4,166,850,000 in 1950, compared with $3,585,634,000 in 1949. (P. By.; X.)

Mineral Production.—Table III shows the tonnage and value of mineral production in the state in 1949 for commodities having values in excess of $100,000, and corresponding data for 1950, so far as they were available at the close of 1951.

Oklahoma.

A west south central state of the United States, Oklahoma was admitted as the 46th state on Nov. 16, 1907. The name "Oklahoma" is from the Choctaw Indian words meaning "red people," and was first applied to the Indian territory in 1866. The popular name "Sooner state" was from the term "sooner" used in referring to a person who entered and staked a claim sooner than the law stipulated when the first public lands in the Indian territory were opened to white settlement by the run for homesteads, April 22, 1889. Area: 69,919 sq.mi., including 888 sq.mi. of water surface. Pop. (1950 census): 2,233,351, a loss of 103,083 or 4.4% since the 1940 census. The two largest cities, with 1950 census, are Oklahoma City, the capital, 243,504; and Tulsa, 182,740. Other cities are Muskogee, 37,289; Enid, 36,017; Lawton, 34,757; Norman, 27,006; Shawnee, 22,948; Stillwater, 20,238; Ponca City, 20,180; Bartlesville, 19,228; Okmulgee, 18,317; Ardmore, 17,890; McAlester, 17,878; Ada, 15,995; Chickasha, 15,842.

History.—The chief state officers during 1951, all Democrats, were: Johnston Murray, governor; James E. Berry, lieutenant governor; John D. Connor, secretary of state; Wilburn Cartwright, state auditor; Mac Q. Williamson, attorney general; A. S. J. Shaw, state treasurer; Oliver Hodge, superintendent of public instruction; Charles G. Morris, state examiner and inspector; Jim Hughes, commissioner of labour; Buck Cook, commissioner of charities; Donald F. Dickery, commissioner of insurance; Andy Payne, clerk of supreme court; John M. Malloy, chief mine inspector. The 23rd state legislature convened in Jan. 1951, with 118 members: 99 Democrats and 19 Republicans. Important legislation included the congressional redistricting act necessitated by loss in the state's population from 1940 to 1950, in which Oklahoma lost two U.S. congressional seats.

Education.—The total enrolment in Oklahoma public schools for the term 1950–51 was 509,088 (elementary and high school), with 19,244 teachers. The total cost of maintaining the elementary and high schools in the state was $76,177,017. State institutions of higher learning included the University of Oklahoma (Norman) and the Oklahoma Agricultural and Mechanical college (Stillwater), both graduate schools; and Oklahoma College for Women (Chickasha), Panhandle Agricultural and Mechanical college (Goodwell), Langston university (Negro, at Langston), and six colleges primarily for teacher training (Ada, Alva, Durant, Edmond, Tahlequah, Weatherford), all state-owned senior colleges. There were 16 two-year junior colleges, of which 7 were state-owned (including the Oklahoma Military academy at Claremore), 3 were independent with church affiliations and 6 were municipal. There were also 6 independent senior colleges with church affiliations. Negroes were admitted for graduate study in the state institutions of higher learning.

Social Insurance and Assistance, Public Welfare and Related Programs.—On Dec. 1, 1951, the Oklahoma department of public welfare reported 96,364 persons receiving old-age assistance, at an average of $48.99 per month each (a total of $4,720,644); 20,205 dependent children families (16,499 adult caretakers), each family receiving an average of $72.13 per month in the care of 50,827 children (a total of $1,457,326); and 2,563 blind cases, each receiving an average of $51.77 per month (a total of $132,685). On Dec. 28, 1951, the state department of health reported that 47 counties in Oklahoma, representing 79.3% of the state's population, were covered by full-time local health departments, all of which (26 units) were under full-time medical directors. State-supported institutions included two tuberculosis sanatoriums, eight hospitals (six mental hospitals, one school for mental defectives and one hospital for epileptics), two orphanages, three schools for deaf and blind, four schools of correction, one reformatory and one penitentiary.

Table I.—*Principal Crops of Oklahoma*

	1951	1950	Average 1940–49
Wheat, bu.	38,902,000	42,363,000	73,998,000

Source: U.S. Department of Agriculture.

Communications.—The summary of disbursements by the state highway department for construction and maintenance was $36,678,205.22 for the period Jan. 1, 1951, to Nov. 1, 1951. The highway department was responsible for a highway system of 10,145 mi. in the state, as of Jan. 1, 1951. The total public open road mileage in Oklahoma was approximately 93,000 mi. Railroad and electric mileage approximated 6,000 mi., not including sidings.

Banking and Finance.—The Oklahoma banking department reported 199 national banks in the state, with a total deposit of $1,370,000,000 on June 30, 1951; and 185 state banks, with a total deposit of $287,460,000. In addition to the banks, the savings and loan associations had approximately $100,000,000 in their savings and loans accounts.

Agriculture.—Despite the decline in the production of most crops from hardships and damage resulting from the lack of moisture during the winter and early spring and from excessive rains in late spring and early summer, the aggregate value of the 26 principal Oklahoma crops was nearly one-fourth larger in 1951 than in 1950, mainly because of higher prices. The aggregate value of the 26 crops in the preliminary report was $341,441,000 in 1951, and $275,186,000 in 1950.

Manufacturing.—The Oklahoma employment security commission reported that the total nonagricultural employment in the state averaged 491,000 persons, with 70,300 engaged in manufacturing activities, for the period Jan. 1 to June 30, 1951. During this same period the average employment covered by the Oklahoma Employment Security act was 289,000 with total wages of $452,000,000. Of these employees, 66,000 were employed in manufacturing, earning $110,000,000. (M. H. W.)

Mineral Production.—Table II shows the tonnage and value of mineral production in the state in 1949 for commodities having values in excess of $100,000 and corresponding data for 1950, so far as they were available at the close of 1951.

Table II.—*Mineral Production of Oklahoma*

(In short tons, except as noted)

Mineral	1950 Quantity	1950 Value	1949 Quantity	1949 Value
Clays.	315,512	$ 313,360	244,104	$ 222,256

Olympic Games.

Teams from the U.S.S.R., western Germany, Korea and Japan were among the representatives of 70 nations expected to compete in the summer games at Helsinki, Fin., July 19–Aug. 3, 1952. More than 2,000 male and about 200 feminine athletes had filed entries.

The Finns, whose plans to play host for the 1940 Olympiad were blasted by World War II, had worked years in preparation for the classic. A new Olympic stadium seating more than 70,000 was built and new housing accommodations for competitors and visitors were erected. French was designated as the official scoring language for the games.

Amateur athletes in the armed forces of the United States became eligible to compete when, on Aug. 7, 1951, the house of representatives armed services committee approved legislation giving fighting men permanent permission to take part in Olympic games. (T. V. H.)

O'Mahoney, Joseph Christopher (1884–), U.S. senator, was born on Nov. 5 at Chelsea, Mass. He was a student at Columbia university in 1905–07 and in 1908 went to Boulder, Colo., where he was a reporter on the *Boulder Herald;* in 1916 he was made city editor of the *Cheyenne* (Wyo.) *State Leader*. The next year he moved to Washington, D.C., as secretary to a U.S. senator; while there he completed his law studies at Georgetown university in 1920 and began practice in Washington and at Cheyenne. He was a member of the Democratic national committee in 1929–34 and vice-chairman of the party's national campaign committee in 1932. From March 6 to Dec. 31, 1933, he was first assistant postmaster general. Appointed U.S. senator from Wyoming to fill a vacancy, he took office Jan. 1, 1934; in Nov. 1934 he was elected for the full term 1935–41. He was re-elected in 1940, and again in 1946 for the term ending in 1953. From 1938 to 1941 he was chairman of the temporary national economic committee investigating monopoly in U.S. business. In the senate he was appointed chairman of the interior and insular affairs committee which during 1950–51 considered admission of Alaska and Hawaii to the union. On Jan. 2, 1951, he was defeated by Sen. Ernest W. McFarland for the post of senate majority floor leader. During the year he continued in support of most administration measures in congress.

Ontario. Second largest province of Canada, Ontario joined the confederation in 1867. Area: 412,582 sq.mi.; pop.: (1941) 3,787,655; (1951 prelim. census) 4,562,354; capital: Toronto (1951 prelim. census) 670,945.

History.—At the regular session of the legislature in 1951 a total of 127 bills became law. Former federal rental controls were taken over by the province on May 1. For the first time in the history of the legislature, one day per week was devoted to private members' bills, but private bills to extend paid holidays, establish a 40-hr. work week and require campaign fund statements for municipal elections were among such bills that were killed. At a special autumn session of the legislature, enabling laws were passed to permit Ontario to participate in the new federal old-age pensions. Progressive-Conservative premier Leslie Frost called an election for Nov. 22 and was swept back into power, as follows (with previous standing in parentheses): Progressive-Conservatives 78 (53), Liberals 8 (13), Co-operative Commonwealth Federation 2 (21), Liberal-Labour 1 (1), Labour-Progressive (Communist) 1 (2).

STILL from a Canadian documentary film recording religious rituals of the Longhouse people (Iroquois), most of whom live on a reservation near Brantford, Ont. A masked medicine man is shown performing a healing ceremony

Education.—Estimates for 1951–52 set aside $63,271,000 for education. The latest revised statistics for provincially controlled schools were for 1948: total enrolment 690,612; average daily attendance 613,627; teachers 23,578; total revenues $90,526,400.

Public Welfare.—In addition to the old-age pension enactments, the legislature passed laws to prevent employment discrimination on the grounds of race and creed (first of its kind in Canada), to provide for equal pay to men and women for equal work and to enable women to sit on juries. Mothers' allowances, workmen's compensation and relief allowances were extended.

Finance.—Public accounts for the 1950–51 fiscal year ending March 31 showed revenues of $260,457,000 and expenditures of $259,181,000. Total sinking funds (for the retirement of public debt) were $90,850,000 on March 31, 1951. The government announced an estimated $598,000 surplus for 1951–52, with no new or increased taxes.

Agriculture.—In 1951 grain crops hit a new high of 219,085,000 bu. The estimated return for all 1951 crops was set at $1,350,000,000 (1950, $1,150,000,000).

Industry.—During the first nine months of 1951 more than 240 new plants costing in excess of $325,000,000 were in the course of construction or came into production. The labour force went up 2.6%, or 47,000 persons, between June 1950 and June 1951.

Minerals.—Total 1951 production was estimated at $400,000,000 (1950: $362,954,000), with only gold showing reduced output. New sources of iron ore (at Nemegos) and silica sand (near Ottawa) were reported.

Oregon. A state of the United States, located in the Pacific northwest, Oregon was admitted Feb. 14, 1859, as the 33rd state. Area: 96,981 sq.mi., including 666 sq.mi. of water. Pop. (1950 census) 1,521,341, an increase of 39.6% from 1940. Capital: Salem (43,140); chief city: Portland (373,628).

History.—The session of the 46th legislative assembly held in 1951 was the longest in the history of the state—116 days. Important enactments were: authorization of a $40,000,000 bond issue for highway construction; legislation to sell bonds and pay a bonus to Oregon veterans of World War II, previously authorized by vote of the people; creation of a state department of finance and administration; repeal of a 40-year prohibition on sale of coloured margarine. Other measures were passed which were suspended through operation of the referendum: a tax of three cents a pack on cigarettes; creation of unified school districts; an increase in the weight-mile fee charged commercial trucks; a ban on the sale of fireworks. Payment of the veterans' bonus was delayed because of the credit restraint imposed by federal defense authorities on the sale of bonds for such purposes.

Elective state officials (administrative) in 1951 included: governor, Douglas McKay; secretary of state, Earl T. Newbry; treasurer, Walter J. Pearson; attorney general, George Neuner; labour commissioner, W. E. Kimsey; superintendent of public instruction, Rex Putnam.

Education.—Enrolment in public schools during the school year 1950–51 was 294,329, including 68,794 in high schools. For the school year 1949–50 professional personnel employed in public schools numbered 11,409 and the average salary received was $3,278. The total operating cost of the schools for the year was $60,501,734.

Enrolment at eight state institutions of higher learning was 15,144 in the year 1950–51, with 14,618 additional enrolled in extension courses. Total operating expenditures of the state system of higher education in 1950–51 amounted to $16,806,350.

Social Insurance and Assistance, Public Welfare and Related Programs.—

Table I.—*Principal Crops of Oregon*

Crop	1951	1950	Average 1940–49
All wheat, bu.	28,999,000	23,693,000	22,666,000
Oats, bu.	7,395,000	8,608,000	9,778,000

Source: U.S. Department of Agriculture.

Expenditures of the public welfare program (general assistance, old-age assistance, aid to the blind, to dependent children and to the disabled) amounted to $29,021,829 for the year ending June 30, 1951.

Payments for unemployment compensation for the year ending June 30, 1951, were $10,602,575.

The number of inmates in state health, corrective and eleemosynary institutions on June 30, 1951, was 8,149. Operating costs for the year were: two mental hospitals $3,446,075; two tuberculosis hospitals $963,652; Fairview home for feeble-minded $1,242,274; state penitentiary $914,766; MacLaren school for boys (Woodburn) $442,833; Hillcrest school for girls $218,130; deaf school $303,989; blind school $145,925. Expenditures of commission for the blind $160,636.

Communications.—Steam railway mileage on Dec. 31, 1950, not including second main track and sidings, was 3,528. Electric railway mileage was 37.4.

As of Dec. 31, 1950, there were 7,313 mi. of state highways of which 6,866 were surfaced. Total mileage in the county road system was 32,566 of which 16,889 mi. were surfaced. Expenditures of the state highway department for the fiscal year ending June 30, 1951, were $37,254,348.

The number of motor vehicles registered in the state during the fiscal year ending June 30, 1951, was: 268,426 passenger cars and 119,197 trucks, pickups and buses. The number of telephones installed as of Dec. 31, 1950, was 438,260.

Finance.—The state bonded debt as of July 1, 1951, was $35,225,430; net $2,570,207. The gross debt of municipal subdivisions on July 1, 1950, was $152,318,995; net $149,425,326. Total state revenues for the fiscal year ending June 30, 1951, were $319,030,072. The assessed valuation in 1951 for the state was $1,694,296,874.

Total bank deposits on Oct. 10, 1951, were $1,551,279,756. On that date there were 21 national banks in the state which operated 87 branches, and 52 state banks operating 16 branches.

Agriculture.—Estimated cash receipts from marketings for the year 1950 amounted to $392,756,000, including $3,411,000 in government payments. Receipts from livestock and livestock products totalled $173,865,000 and from all crops $215,480,000.

Manufacturing.—Lumbering is the principal manufacturing activity in Oregon. This state ranks first in the volume of lumber production, which in 1950 amounted to 12,223,092 bd.ft. Plywood production in 1949 was 709,148,000 sq.ft., three-eighths inch basis. (C. A. Sp.)

Mineral Production.—Table II shows the tonnage and value of mineral production in the state in 1949 for commodities having values in excess of $100,000, and corresponding data for 1950, so far as they were available at the close of 1951.

Organization for European Economic Cooperation:

see European Recovery Program; International Trade.

Organization of American States.

On Dec. 13, 1951, Colombia deposited its ratification of the charter of the Organization of American States, signed at Bogotá in 1948, bringing the number of ratifications to 14—the necessary two-thirds of the 21 signatory states to bring the charter into legal force. After 1948 the charter was in provisional effect, under the terms of a resolution adopted at the Bogotá (ninth) International Conference of American States. Later in the month the government of Venezuela also ratified the charter. Ratifications by Argentina, Chile, Cuba, Guatemala, Peru and Uruguay were still pending.

The charter established these agencies to accomplish the organization's purposes: the Inter-American conference; the Meeting of Consultation of Ministers of Foreign Affairs; the Council of the Organization; the Pan American Union; the specialized conferences; and the specialized organizations. No meeting of the Inter-American conference was held during 1951, but the Council of the Organization began preliminary preparations for the tenth conference, scheduled to meet in Caracas, Venez., in 1953.

The fourth Meeting of Consultation of Ministers of Foreign Affairs was an outstanding event of 1951. It met at the Pan American Union in Washington, D.C., from March 26 to April 7, following a request of the United States for a meeting to consider the aggressive policy of international communism and the measures that should be taken to meet it. All 21 of the American republics were represented at the meeting, 20 of them by their foreign ministers. The three topics of the agenda dealt with political and military co-operation, internal security and emergency economic co-operation.

On the subject of political and military co-operation the conference adopted the "declaration of Washington" in which the foreign ministers declared the firm determination of the American republics to remain united in the existing emergency, or in the face of any aggression or threat against any one of them. Measures of inter-American military co-operation were agreed upon, and the Inter-American Defense board was charged with the preparation of military plans for common defense of the hemisphere.

The meeting emphasized the need for each country to review its laws and regulations to assure its internal security against the encroachments of international communism, and to prevent and punish subversive activities. The Pan American Union was requested to undertake technical studies for the purpose of facilitating the execution of this resolution.

Major consideration was directed to questions of an economic character, and resolutions of a two-fold character were adopted: the production and distribution of products in short supply and utilization of necessary services to meet the requirements of the economies of the American republics; and measures to facilitate the carrying out of programs of economic development.

By the terms of the charter, the Council of the Organization, with one representative from each member state, became, in effect, the permanent executive organ of the organization. It established its headquarters at the Pan American Union in Washington. In 1951 the council, in addition to exercising general supervision over the other agencies of the organization and making the necessary arrangements for the fourth Meeting of Consultation of Ministers of Foreign Affairs, continued its study of the structural development of the inter-American system. Following a study of existing agencies for the codification of international law, the council reached the conclusion that a number of them could be abolished, in view of the establishment of the Inter-American Council of Jurists and the Inter-American Juridical committee.

The council also made a study of the Inter-American Peace committee and the Inter-American Defense board, and concluded agreements of co-operation with a number of international organizations, among them U.N.E.S.C.O. and F.A.O.

At the meeting of the council held Nov. 21, Ambassador John C. Dreier of the United States was elected chairman for the following year, succeeding Ambassador Hildebrando Accioly of Brazil. At the same time Ambassador Rafael Heliodoro Valle of Honduras was elected vice-chairman, succeeding Ambassador René Lepervanche Parparcén of Venezuela.

The Council of the Organization was assisted by three subsidiary technical agencies, the Inter-American Economic and Social council, the Inter-American Council of Jurists and the Inter-American Cultural council.

The Inter-American Economic and Social council held a special session at Panamá from Aug. 20 to 30, 1951, to give further consideration to the economic resolutions adopted at the fourth Meeting of Consultation of Ministers of Foreign Affairs. During 1951 the council also initiated a program of technical co-operation of the Organization of American States, being carried out in collaboration with the Pan American Union and the specialized agencies of the organization.

The Inter-American Cultural council held its first meeting at Mexico City from Sept. 10 to 25, 1951. At that time a comprehensive program of inter-American cultural co-operation was adopted, and the Permanent Committee for Cultural Action was appointed, composed of representatives of the United States, Mexico, Brazil, Haiti and Uruguay. The provisional seat of the committee was to be in Mexico City.

The Inter-American Council of Jurists did not hold a meeting during 1951, but its Permanent committee, the Inter-American Juridical committee, with its seat in Rio de Janeiro, Braz., continued its study of the program for the development and codification of international law drawn up by the Council of Jurists at its first meeting in 1950. On April 18, 1951, the Council of the Organization approved the definitive statutes of the Council of Jurists.

The Pan American Union, by the terms of the charter, became the general secretariat and the central and permanent organ of the organization, with headquarters in Washington. The Pan American Union also served as the secretariat of the three technical organs of the council.

The Inter-American specialized organizations became, under the terms of the charter, the intergovernmental organizations established by multilateral agreements and having specific functions with respect to technical matters of common interest to the American states. As a result of action taken by the Council of the Organization the following agencies were declared specialized organizations: the American International Institute for the Protection of Childhood; the Pan American Institute of Geography and History; the Pan American Sanitary Bureau; the Inter-American Indian Institute; the Inter-American Institute of Agricultural Sciences; and the Inter-American Commission of Women.

During 1951 inter-American conferences and meetings were held in the fields of agriculture, public health and sanitation, statistics, social security, highways and transportation. The seventh assembly of the Inter-American Commission of Women was held at Santiago, Chile, from May 30 to June 16, 1951.

Ottawa. The capital of Canada, at the confluence of the Ottawa-Gatineau-Rideau rivers, in the province of Ontario, covers 28,134 ac.; pop.: (1941) 154,951; (1951 prelim. census) 198,773.

The city council unanimously agreed to reduce the number of wards from 14 to 9, thus cutting from 28 to 18 the number of aldermen and the total council membership from 33 to 23. The change-over was slated for the Dec. 1952 election, to affect the 1953 council. The total taxable assessment as the basis for 1951 taxation rose to $226,097,315 from $211,217,501 the year before. The 1951 estimated expenditures were $14,729,972 compared with actual expenditures of $12,886,614 in 1950. In the Jan. 1950–Aug. 1951 period the city council spent $13,766,557 in municipal capital expansions (streets, waterworks, schools, hospitals, bridges, etc.). The federal government in its 1951–52 estimates voted Ottawa $762,392 in lieu of taxes on federal buildings; planned to spend nearly $23,000,000 for new, and on existing, federal buildings in the capital; and authorized the federal district commission to construct district railways under the national capital plan. By mid-1951 the commission already had acquired 4,000 ac. of land along the proposed new railway lines for industrial use.

Pace, Frank, Jr. (1912–), U.S. government official, was born in Little Rock, Ark., on July 5. He received a bachelor's degree from Princeton university in 1933 and a law degree from Harvard university in 1936. In that year he became assistant district attorney in the 12th judicial district in Arkansas. From 1938 to 1940 he was general counsel of the Arkansas state department of revenue. During World War II he served for four years in the air transport command, reaching the rank of major.

In 1946 he was made a special assistant in the U.S. department of justice, dealing with tax matters; in May 1946, executive assistant to the postmaster general; in Jan. 1948, assistant director of the bureau of the budget, and in Jan. 1949, director of that bureau. Late in March 1950 he was nominated secretary of the army. Secretary Pace, in Korea at the time Gen. Douglas MacArthur was relieved of his command, was revealed to have been charged with the responsibility of telling General MacArthur in advance, but was said in subsequent congressional testimony not to have received the information in time to do so before the public announcement. It was Pace who announced Aug. 3 the news of the ouster of 90 West Point cadets, including several athletes, for cheating in examinations.

Pacific Islands, British. Under this heading are grouped the colony of Fiji (7,040 sq. mi.; pop., 1948 est., 284,955) and the territories administered by the high commissioner for the western Pacific. Included are the Gilbert and Ellice Islands (colony; 375 sq.mi.; pop., 1950 est., 36,000); Solomon Islands (protectorate; 11,500 sq.mi.; pop., 1950 est., 98,581); Tonga (protectorate; 250 sq.mi.; pop., Dec. 1950 est., 45,000); New Hebrides (*q.v.*). Populations: Micronesian, Polynesian, Melanesian. Religion: Fijians mainly Christian. Capital of Fiji: Suva (pop., 1946, Europeans only, 2,266). Governor of Fiji and high commissioner: Sir Leslie Brian Freeston; ruler of Tonga, Queen Salote Tupou.

History.—John Dugdal, minister of state for the colonies, visited Fiji and the western Pacific during Aug. 1951. While he was there it was announced that the arrangement by which the governorship of Fiji and the high commissionership of the western Pacific had generally been held by one individual would not be continued after the next change of governor. The headquarters of the high commission were expected to move, when that change took place, from Suva to Honiara, in the Solomon Islands. Later it was announced that Sir Brian Freeston, the governor, was to be appointed secretary-general of the South Pacific commission.

In October it was announced that the 1st battalion, the Fiji infantry regiment, would go to Malaya early in 1952 to help with the war against the Communist terrorists. The colony's development plan and a community development project progressed well, and high prices for raw materials ensured continued prosperity.

On Feb. 16 Tonga celebrated the 50th anniversary of its treaty with Great Britain and Queen Salote received a special message from King George VI.

Education.—*Solomon Islands:* 1 government school at Auki; several missionary schools. *Gilbert and Ellice Islands:* free and compulsory education to 16; 233 primary schools (2 government, remainder mission), 8,000 pupils; many pupils sent to Fiji and New Zealand for further education. *Tonga:* free and compulsory education to 14; 129 primary, 9 secondary schools; 1 teacher training college; pupils sent to New Zealand and Fiji for higher education. *Fiji:* 427 primary (48,000 pupils), 2 secondary, 2 technical schools (2,000 pupils); teacher training college and central medical school.

Finance and Trade.—Currency: Australian pound (£A1 = U.S. $2.24); Fijian pound (£F1 = U.S. $2.52); sterling; Tonga issues its own notes, the Tonga pound being valued at U.S. $2.24 in Oct. 1951. Principal ex-

Pacific Islands, French.

Under this heading are grouped two French overseas territories and the Anglo-French condominium of New Hebrides (*q.v.*). New Caledonia and dependencies have an area of 7,654 sq.mi. of which New Caledonia is 6,533 sq.mi.; pop. (1950 est.) 50,000. The native population is Melanesian with Polynesian admixtures; Europeans (1946) 18,737, mostly French; 8,600 Javanese; 4,100 Annamese immigrants. Nouméa (pop., 1946, 10,466) is the seat of the commissioner general for the Pacific ocean, Raoul Angammare.

The French Settlements in Oceania consist of the Society Islands (the largest of which is Tahiti), the Marquesas, Tuamotu and other smaller islands, with a total area of 1,545 sq.mi.; pop. (1950 est.) 60,000. The native population is Polynesian, majority Christian; Europeans (1946) 1,700 including 900 French and 500 British; also 6,390 Chinese immigrants. Papeete, on Tahiti (pop., 1946, 12,428), is the seat of the governor.

History.—Demographic statistics showed considerable increases in New Caledonia: in 20 years Europeans had increased by 33%, natives by 18%. Expansion of the areas under cultivation (only 6,500 ha. out of 318,000 taken over) became imperative. Livestock (90,000 head) could also be increased.

An Institut Français d'Océanie has its seat at Nouméa. A geological map was in preparation during 1951, and prospecting revealed new deposits of chrome. The South Pacific commission, likewise with its seat at Nouméa, undertook an extensive survey with a view to improving economic and social conditions throughout the isles.

New Caledonia's air-line communications were improved: two flights a month between Saigon and Nouméa put the town within two days' reach of Paris. Pan American World Airways and an Australian company provided a weekly link with Sidney, Austr., and San Francisco, Calif.

In Oceania new vistas were opened by the survey of the wealth of the seas, especially when the presence of tunny was revealed. Work was in progress to develop communications.

Deputies elected on July 1 (New Caledonia) and Sept. 2 (Oceania) to the national assembly in Paris were: an Independent in New Caledonia and an Autonomist (Pouvanoa Ooba) in Oceania. (*See* also French Union.)

Education.—*New Caledonia* (1950): pupils, primary 9,522, secondary 508, technical 132; bursaries in France 35. *Oceania* (1950): pupils, primary 11,408, secondary 285, technical 96; bursaries in France 23.

Finance.—Budget: *New Caledonia* (1951 est.), balanced at 387,000,000 fr. C. F. P.; *Oceania* (1951 est.), balanced at 238,000,000 fr. C. F. P. Monetary unit: franc C. F. P. (Colonies Françaises du Pacifique) = 5.50 metropolitan francs. Exchange rate (Sept. 1950): U.S. $1 = 350 metropolitan francs.

Foreign Trade.—(1950) *New Caledonia:* imports 732,000,000 fr. C. F. P., including 297,000,000 fr. C. F. P. from France and 200,000,000 fr. C. F. P. from Australia; exports 522,000,000 fr. C. F. P., including 382,000,000 fr. C. F. P. to France. The principal exports were nickel, chrome and coffee. *Oceania:* imports 535,000,000 fr. C. F. P. including 272,000,000 fr. C. F. P. from the U.S. and 116,000,000 fr. C. F. P. from the French union; exports 478,000,000 fr. C. F. P. including 264,000,000 fr. C. F. P. to France and 91,000,000 fr. C. F. P. to New Zealand. The principal exports were copra, 258,000,000 fr. C. F. P.; phosphates, 146,000,000 fr. C. F. P.; vanilla, 44,000,000 fr. C. F. P.

Transport and Communications.—Cargo handled in ports (1950): Nouméa, 480,000 metric tons; Papeete, 250,000 metric tons. (Hu. De.)

Pacific Islands under Trusteeship: *see* Marshall, Caroline and Mariana Islands; Trust Territories.

Padilla Nervo, Luis

(1898–), Mexican statesman, was born on Aug. 19 at Zamora, state of Michoacán, Mex. He graduated from the law schools of the National University of Mexico, Mexico City, and George Washington university, Washington, D.C., and studied also at the University of Buenos Aires and at London university. He entered the Mexican diplomatic service after World War I, serving as chargé d'affaires at several embassies until 1933. He was also undersecretary of public education and fine arts and assistant secretary of labour and social welfare in Mexico City. His advance in the diplomatic service was rapid. After various posts in Buenos Aires, Washington, London and Madrid, he was named envoy extraordinary and minister plenipotentiary in 1933, representing Mexico successively in nine nations of Europe and North and South America. In May 1943 he was Mexican delegate at the United Nations Conference on Food and Agriculture at Hot Springs, Va., and in 1945 adviser to the Mexican delegations of both the U.N. Conference on International Organization at San Francisco, Calif., and the U.N. Preparatory commission at London. In 1946 he was appointed permanent Mexican delegate, with the rank of ambassador, to the U.N. Security Council and to the U.N. general assembly.

On Nov. 6, 1951, Padilla Nervo was elected president of the U.N. general assembly on the first ballot. He was chairman of a special sub-committee appointed to conduct disarmament negotiations among Great Britain, France, the U.S. and the U.S.S.R. in December at Paris. These talks proved fruitless, however, and ended without agreement on Dec. 10.

Painting.

The trend of recent years toward abstraction continued during 1951, both in western Europe and the United States. Geometric, biomorphic and amorphous abstractions and nonobjective paintings not only increased in number in proportion to representational work, but often dominated exhibitions. Expressionism and surrealism seemed to decline, and in the United States local scene or regionalist painting all but disappeared. The same tendencies were reflected in the art schools.

During the course of the year both national and regional exhibitions in the United States illustrated this nationwide trend. For example, in Minneapolis, Minn., the Walker Art Centre's third Biennial of Paintings and Prints from the Upper Midwest was described as "showing a strong trend toward abstraction." The Northwest Artists annual at Seattle, Wash., in October had "a greater proportion of non-objective and highly abstracted works than ever before." The Los Angeles, Calif., national exhibition, "Contemporary Painting in America," was described as a "flight from Renaissance tradition" and estimated to be "two-thirds semi-abstract or non-objective."

In a number of cases critics objected to the trend on the grounds that the young artists regurgitated the concepts of the older generation of abstract painters and that there appeared to be no real masters among the younger group.

The Los Angeles exhibit of local artists was stigmatized as "ultramodern," and a public row ensued in which hypothetical Communist political affiliations of modern art styles and artists were carelessly introduced by antagonists of recent trends, who were ignorant of the fact that the U.S.S.R. and other "iron curtain" countries countenance in painting only an optimistic social realism which is relatively photographic in form—the very thing which the American opponents of modern art themselves favour.

Many critics, however, remained sympathetic to the mush-

Five of 20 portraits by Marcel Vertès in which he painted famous persons as he imagined they must have looked in childhood. The series was exhibited at the Kleemann galleries, New York city, in 1951

Above, left: ELEANOR ROOSEVELT was pictured as a sad little girl because Vertès read her autobiography and said she described herself that way

Above, right: OF WINSTON CHURCHILL, Vertès recalled, "He said himself that every baby in the United Kingdom looked like him"

Right: THE DUKE AND DUCHESS OF WINDSOR Vertès placed "on the same canvas with a rock and a fog as separation. The two people already there waiting for each other"

Below left: GRETA GARBO was painted at a window, not looking out of it "but into it, turning her back on the world"

Below, right: GEORGE BERNARD SHAW was drawn as Vertès imagined him at the age of 12, "beardless, but as much on the offensive as he was as a man"

room growth of abstraction in the United States, and followed the lead of the Museum of Modern Art, N.Y., in supporting experimentalism and the compulsion for originality, and in looking with special favour upon a group of painters, some of whom spoke of themselves as the "New York school." This loosely defined group, which might be said to include such artists as Robert Motherwell, William De Kooning, Jackson Pollock, William Baziotes, Adolph Gottlieb, Bradley Tomlin, Mark Rothko, Theodoros Stamos and Hans Hofmann, painted nongeometric and informal abstractions, emphasizing the symbolic import of nonrepresentational shapes and signs to the "unconscious" of the spectator. In their work, the decorative potential of nonobjective form was ordinarily a secondary aim, and may or may not have been deliberately intended by the artist. This group had been developing its special emphasis during the past five years.

In western Europe, where a minority of artists had come under Communist influence, paintings were hopeful, propagandistic and realistic. A majority, which probably increased during the year 1951, were near-abstract and in varying degrees indebted to Pablo Picasso, Henri Matisse, Paul Klee, Wassily Kandinsky, Piet Mondrian, Joan Miro and a few other old masters of modern art. This was true of painting in France, Italy, England and western Germany, as well as in the U.S.

The stylistic differences of the older generation of masters were being levelled off to produce a melting pot of common aims and of near-abstract forms, motifs and ideographs. Their work seemed very similar to all but the most discriminating specialists. National stylistic differences were probably less marked than at any time in history, so that the painting of the middle of the 20th century seemed likely to be described as an international style in the texts of future art historians. It was treated currently as a single phenomenon by the Russians, who called it "the formalist heresy" when it appeared among artists under their control or influence.

The use of modern religious art for devotional purposes was given a boost in 1951, as, during the summer, Matisse completed the murals, stained glass design and other ornament for the Dominican chapel, Vence, Fr., and Motherwell, Gottlieb and the sculptor Herbert Ferber finished the *décor* of the synagogue at Millburn, N.J.

The major gift of paintings during the year 1951 was the Walter and Louise Arensberg collection of 20th century art, which went to the Philadelphia museum. This, added to the Albert E. Gallatin collection, made the Philadelphia museum one of the several most important in the world in the field of modern art. In October the Boston Museum of Fine Arts announced a valuable gift of 230 American paintings of 1815–1865 from Maxim Karolik. In July the Philadelphia collector Albert C. Barnes died in an automobile accident, leaving one of the finest collections of modern painting in the world, worth an estimated $20,000,000 to $25,000,000, in the care of the trustees of the Barnes foundation, Philadelphia, Pa. (*See* also ART EXHIBITIONS; ART SALES; MUSEUMS; SCULPTURE.)

Paints and Varnishes. Paint production in the United States in 1951 was estimated to reach a value of $1,250,000,000, thereby exceeding the dollar value of all previous years' sales. Production remained high in all areas of paint manufacture and use except for a moderate slump in industrial finishes during the last quarter, attributed to a temporary readjustment of industrial production to meet military requirements. Raw material shortages persisted throughout the year, particularly in the ever-increasing demands for lead and phthalic anhydride. Tung oil was high in price as was also dehydrated castor oil, which was further limited severely because of military demands for raw castor oil for purposes other than paint. Many paint materials were allocated by the government. Phenolic resin shortages eased somewhat as a result of the greatly expanded production of phenol by the established processes and the promise of further quantities of phenol by a new process involving the direct oxidation of cumene, followed by decomposition of the resulting cumene hydroperoxide into phenol and acetone.

The uses of styrenated alkyds expanded considerably, one important use being the coating of artillery shells.

The two principal producers of water-thinned paints based on styrene-butadiene latices were joined in competition by many other paint companies. Some of these made new claims of durability on exterior surfaces for water-thinned paints.

Silicone solutions as waterproofers of exterior masonry were offered by several firms, while one major firm announced a production finishing enamel based on silicones with claims of resistance both to high temperatures and to various reagents. In the trade sales field there was an increased popularity of roller coaters, including both rollers with a paint vessel within the roller and rollers fed by a hose from a paint pressure tank.

Paint manufacturers, like other industries, were confronted with higher civic standards on air pollution and sought new devices for better suppression of varnish and oil fumes. To the ancient technique of grinding or dispersing paint pigments in ball or pebble mills came an offering of porcelain ovals as superior to porcelain spheres.

An important addition was made in the search for a general theory on the mechanism of atmospheric destruction of paint films. The necessity of both moisture and solar radiation and of the interrelation between the two was shown. More quantitative observations of these factors were necessary to correlate studies on exposure value of paints. The surprising improvement in durability through the addition of small amounts of dichromate salts to nitrocellulose lacquer implied that oxidation-reduction phenomena play an important role in the degradation of paint films.

(Jo. C. W.)

Pakistan. A self-governing member of the Commonwealth of Nations, Pakistan is a federation of 5 provinces, 12 states and tribal areas. Areas and populations are:

Provinces and states*	Area (in sq.mi.)	Population (1951 census)	Population (1941 census)
Sind	50,443	4,619,000	4,175,500
Khairpur state	6,050	320,000	
West Punjab	62,987	18,814,000	15,800,000
Bahawalpur state	15,918	1,820,000	
North-West Frontier Province:			
(a) Settled districts	13,815	3,239,000	3,038,100
(b) Tribal areas	27,242	2,460,000	2,500,000
Baluchistan	52,900	622,000	857,800
Baluchistan states	81,239	556,000	
Karachi, federal capital	812	1,118,000	359,500
Total, West Pakistan	311,406	33,568,000	26,730,900
East Pakistan (East Bengal)	54,501	42,119,000	41,880,000
Total	365,907	75,687,000	68,610,900

*Excluding Jammu and Kashmir (*q.v.*).

Languages: Urdu, Punjabi, Baluchi and Pashtu in West Pakistan and Bengali in East Pakistan; English used as a medium of instruction in higher education. Religion: Moslem (72.9%); Sikh, Hindu, Christian, Parsee and other minorities. Chief towns (pop. 1951 census): Karachi (cap., 1,005,000); Lahore (849,000); Dacca (401,000); Chittagong (269,000); Rawalpindi (243,000); Hyderabad, Sind (229,000); Multan (190,000); Lyallpur (180,000); Peshawar (114,000). Governor general of Pakistan in 1951: Khwaja Nazimuddin and (from Oct. 17) Ghulam Mohammed; prime ministers: Liaquat Ali Khan and Khwaja Nazimuddin (*q.v.*).

PAKISTANI MOSLEMS playing martial music on their native drums and flutes as tensions rose in 1951 over the disposition of Kashmir

History.—*The New Constitution.*—The leading event of 1951 was the promulgation of the new constitution. The constitution was to be basically in accordance with Islamic principles but would embody features borrowed from the Government of India act, Oct. 1935, and the governments of Great Britain and the United States. The supreme executive power would vest in the head of the state, who would be elected by a joint session of both houses for a term of five years and would act on the advice of his ministers. The danger of a dictatorship was ruled out by a provision that he could not hold office for more than two consecutive terms. Parliamentary government was to be conducted by the central and provincial legislatures, the former being bicameral and the latter unicameral. In the event of a conflict of opinion between the two houses of the federal legislature or in the election or removal of the head of the state, the matter should be decided at a joint session. Residuary powers would rest with the federal legislature, and the interpretation of the constitution would rest with the judiciary. Amendments of the constitution would have to obtain a two-thirds majority in both houses of the central legislature and a majority in the provinces. The question whether Pakistan was to remain a member of the Commonwealth of Nations was left open. Urdu was to be the official language of the state, but the constitution was to be drawn up in Urdu and English.

The Military Conspiracy.—In March the country was startled by the arrest of a number of prominent persons, including Maj. Gen. Akbar Khan, chief of general staff, Brig. M. A. Latif, brigade commander at Quetta, and Faiz Ahmad Faiz, editor of the *Pakistan Times,* for conspiracy. Nine more army officers and Air Commodore Mohammed Khan Janjua were arrested in May. The trials were held *in camera* at Hyderabad, Sind. The defense minister announced that the object of the conspiracy, of which the ringleader was Maj. Gen. Akbar Khan, was, by the use of violence and the subversion of the armed forces supported by revolutionary Communist elements, to remove high civil and military officers and, when the existing authorities, civil and military, had been eliminated, to bring the country under dictatorship. The government was then to be formed on the Communist model, and for this purpose economic and constitution-making missions were to be invited from the Soviet Union.

Relations with India.—Apart from the dispute over Kashmir, relations between Pakistan and India had considerably improved by the early part of 1951. In Feb. 1951 a six months' agreement for the exchange of commodities was signed. Imports from India were to include coal, iron, steel, timber, cement, cotton yarn, jute manufactures, paper, rubber tires and mustard oil; India would receive in return raw jute, cotton, cowhides and sheepskins. Pakistan would sell to India 70,000 tons of food grains and India informed the Pakistan government that it was prepared to conduct exchange transactions on the basis of the existing par value of Pakistan currency. But these promising signs were marred by the intense feeling aroused when it became known that Sheikh Abdullah was about to summon a constituent assembly for the purpose of drawing up a constitution for Kashmir, with the approval of India but against the advice of Frank Graham, the United Nations mediator (*see* KASHMIR). It was felt that this would prejudge the whole question of accession, at present before the Security council. Attempts to bring about a meeting between the premiers of the two countries ended in failure.

Murder of the Prime Minister.—The murder of the Pakistani prime minister, Liaquat Ali Khan, by a fanatic during a political meeting at Rawalpindi on Oct. 16, brought both Pakistan and India to a more realistic frame of mind. Messages of sympathy for the people of Pakistan poured in from all sides, including moving tributes from the Indian president and Jawaharlal Nehru. Liaquat Ali Khan's death necessitated administrative changes. The governor general, Khwaja Nazimuddin, took over his portfolio, and was succeeded in office by the finance minister, Ghulam Mohammed. Ismail Chandrigar, governor of the North-West Frontier Province, took over the governorship of West Punjab from Abdurrab Nishtar who was made minister of industries. (*See* also UNITED NATIONS.)

BIBLIOGRAPHY.—Liaquat Ali Khan, *Pakistan: The Heart of Asia* (1951). (H. G. RN.)

Education.—*Baluchistan:* Schools (Oct. 1949): primary 186, secondary 23, private 4, European 2, institutions of higher education 1; total pupils 18,500. *North-West Frontier Province:* Recognized educational institutions (1947–48): for males 1,059, students 101,377; for females 156, pupils 11,035. *Sind:* Schools (March 1946): primary, for boys, 2,327, pupils 165,653; for girls, 398, pupils 40,257; secondary, for boys, 206, pupils 34,810; for girls, 37, pupils 9,262. Colleges 9, students 3,700.

Finance and Banking.—Budget: (1950–51 actual) ordinary revenue Rs. 1,237,000,000, ordinary expenditure Rs. 947,000,000; (1951–52 est.) ordinary revenue Rs. 1,163,000,000, ordinary expenditure Rs. 955,000,000. Internal debt (March 1951): Rs. 952,000,000. Currency circulation (July 1951): Rs. 1,960,000,000. Bank deposits (July 1951): Rs. 1,258,000,000. Gold and foreign exchange (July 1951): U.S. $597,000,000. Monetary unit: Pakistan rupee, with an exchange rate of Rs. 3.31 to the U.S. dollar.

Foreign Trade.—(1950): Imports Rs. 1,482,000,000; exports Rs. 2,230,000,000. Main sources of imports (1950): U.K. 26.4%; Japan 14.9%; India 12.6%; U.S. 9.4%. Main destinations of exports: U.K. 17.1%; Japan 11.0%; U.S. 10.9%; France 8.6%. Main imports (1949–50): cotton piece goods 22.6%; cotton yarn and twist 14.7%; machinery and millwork 7.4%; vehicles (excluding locomotives, etc.) 5.6%. Main exports: raw cotton 46%; raw jute 32.5%; black tea 6.4%; raw wool 4.1%.

Transport and Communications.—Roads (1949): 55,913 mi. Licensed motor vehicles (Dec. 1950): cars 17,000, commercial 12,000. Railways (1950): 6,994 mi.; passenger-miles 5,456,000,000; freight net ton-miles 2,500,000,000. Shipping (1949): merchant fleet 120,000 gross tons. Air transport (1949–50): miles scheduled per week 136,030. Telephones (Jan. 1949): 16,454. Radio receiving sets (1949): 75,000.

Agriculture.—Main crops (metric tons, 1950): rice 12,500,000; wheat (1951) 3,741,000; barley 157,000; maize (1949) 430,000; sugar, raw value, excluding palm sugar production, 570,000; jute 910,000; cotton, ginned, 253,000; linseed 11,000; rapeseed and mustard seed 282,000; sesame 34,000; chick-peas (1949) 798,000; tea 23,800; tobacco (1949) 66,800. Livestock (1947–48): cattle 24,296,000; buffaloes 5,600,000; goats 10,067,000; sheep 6,145,000; camels 454,000; horses 470,000; mules 41,000; geese 61,000; chickens 22,248,000; ducks (1949) 5,063,000. Wool production, greasy basis (1950) 11,000 metric tons. Meat production (1949) 308,000 metric tons. Milk production (1949) 5,917,000 metric tons. Fisheries (1949–50): total catch 250,000 metric tons.

Industry.—Employment (1949): all industries 662,000; manufacturing 200,000. Fuel and power (1950): coal and lignite 444,000 metric tons; crude oil 165,600 metric tons; electricity 164,400,000 kw.hr. Raw materials: chromite (1950) 18,700 metric tons; salt (1948) 339,000 metric tons. Manufactured goods (metric tons, 1950): cement 412,000; cotton yarn 19,700; cotton cloth 836,000,000 m.

Palaeontology.

Vertebrate.—In 1951, the study of fossil backboned animals continued to be pursued with vigour throughout the world. Published results of research, although relatively few in numbers, reflected well-planned field exploration and critical laboratory analysis. The highlight of general interest for the year was the appearance of a monumental work entitled *Evolution Emerging,* by W. K. Gregory, which summarized the evidences of the changing organization of life during 500,000,000 years. The annual bibliography also included many important articles of broad professional use. The varied subject matter of the latter was illustrated by a compilation of papers on the stratigraphic correlation of continental vertebrate-bearing beds in many parts of the world reported to the 18th session (Great Britain) of the International Geological congress; a good elementary history of vertebrate animals by E. Kuhn; and an expression of the constant need by all workers to review the objective principles of palaeontology by E. C. Case.

Fishes.—Extending detailed studies on the primitive fish groups, R. H. Denison investigated the evolutionary changes of a number of selected morphologic characters possessed by members of early agnathous order Osteostraci. The proposal of an appropriately revised classification resulted. This author also made a histological examination of the exoskeleton of the same order. The endoskeleton of the placoderms and fossil elasmobranchs (with general remarks on the hard tissues of lower vertebrates) was the subject of an important histological paper by T. Ørvig. Among other significant advances in knowledge were descriptions of the skulls of some Mississippian and Pennsylvanian ray-finned fishes by D. H. Rayner, and the reconstruction of the head of the Permian lungfish *Gnathorhiza* by E. C. Olson. In exhibiting the oldest known pelvic clasping spines, a small shark from the Devonian shales of Ohio reported by J. E. Harris was perhaps the most interesting new form described.

Amphibians.—Employing a statistical method for the detection and evaluation of growth in fossil samples developed in collaboration with R. L. Miller, E. C. Olson analyzed a series of skulls of the horned Permian amphibian, *Diplocaulus.*

Reptiles.—A. Bellairs and G. Underwood, with abundant reference to palaeontological information, reviewed and interpreted all evidences relative to the origin of snakes. Description and discussion of the relationships and stratigraphic occurrence of the primitive Triassic crocodile *Protosuchus* was presented by E. H. Colbert and C. C. Mook. Additional fossil reptile studies were several short notes (F. von Huene) on various Triassic and Jurassic materials; description (C. M. Sternberg) of a complete skeleton of the horned dinosaur *Leptoceratops* from the upper Cretaceous of Alberta, Can.; and report (M. K. Hecht) on fossil Gekkos from the West Indies. New materials described include a diadectid and a captorhinid from the Permian of Texas by E. C. Olson; a variety of Oligocene amphisbaenid lizards of the genus *Rhineura* by E. H. Taylor; and several additions to the mammal-like reptile fauna of the Karroo system of South Africa by A. S. Brink.

Birds.—T. Edinger made a palaeoneurological study of the ancient toothed birds of the Cretaceous epoch known as the Odontognathae. The facts were demonstrated that the brains of both the flying *Ichthyornis* and the flightless *Hesperornis* were not intermediate between reptilian and avian types but were typically birdlike in proportion and position of parts. L. Miller reported the first fossil occurrence of a storm petrel from marine Miocene deposits in California.

Mammals.—The early Tertiary history of the Rodentia was summarized by R. W. Wilson who interpreted the available facts as indicative of differentiation of the parent stock during Palaeocene times and of development of the modern divisions of the order during the Eocene. G. G. Simpson wrote an excellent popular account of horses—their structure, relationships, classification and fossil history. W. O. Dietrich discussed the origin of the recent and fossil African elephants; a new jumping mouse from the Pliocene of Kansas and a new antilocaprid from the Pliocene of Oklahoma were described by C. W. Hibbard; new discoveries of Pleistocene jaguar skeletons from Tennessee caves were reported by E. McCrady, H. T. Kirby-Smith and H. Templeton; and C. B. Schultz and associates presented a graphic résumé of the Ice Age deposits of Nebraska with notes on their contained fossil mammalian remains.

(D. H. D.)

Palaeobotany.—In June 1950 the National Research council issued, under the editorship of Theodor Just (Chicago Natural History museum, Ill.) and several others, the report of the committee on palaeobotany, bringing this source of fossil plant literature up to date and including the work of all palaeobotanists in North and South America. Similar reports were being issued by Britain, Sweden (covering continental Europe) and India (including much of south Asia).

One of the most unique modes of plant preservation is found in the petrifactions known as coal balls. Although studies of coal-ball plants were initiated in England nearly 90 years before, specimens were not located in America until the early 1920s, and only in recent years had intensive research programs been undertaken. During 1951 large collections were made by palaeobotanists from several American universities. Robert W. Baxter (University of Kansas, Lawrence) described a new species of *Ankyropteris,* a member of the primitive Coenopterid ferns. A new *Botryopteris,* also a member of this group, was described from southern Illinois. Baxter also described a new sphenopsid cone (a plant related to the modern horsetail rushes) from an Indiana coal ball.

A comprehensive review of American coal-ball floras was given by Henry Andrews in the June issue of the *Botanical Review.* This dealt with the earliest discoveries of these petrifactions in the United States, their geographical and stratigraphical origin, and included a bibliography and a list of the plants found with comments on the more significant species.

One of the most rapidly advancing phases of palaeobotanical research was the study of fossil pollen grains and spores. Most of the studies in this field had dealt with the spores of the Carboniferous Age coal and the pollens of the much more recent Pleistocene (Glacial) Age. In the case of the latter the fossils represented species which for the most part are still living and these studies had contributed largely to knowledge of floristic changes during the past few millenniums; studies of the Carboniferous spores and pollens were concerned chiefly with stratigraphical problems, that is, they were being used as an aid in correlating rock formations which are exposed at various geographical points. A particularly significant contribution in this field was Robert Kosanke's monograph of the Illinois coal spores. Several contributions were made in this field by the German geologist Robert Potonie and his associates. This group of workers dealt largely with Tertiary pollens. A review of their work with a comprehensive bibliography was published in *Palaeontographica* (April 1951).

Chester Arnold (University of Michigan, Ann Arbor) presented a comprehensive account of the fossil plants in the Michigan coal basin, an area occupying the central part of the lower peninsula of that state. This is a flora rich in arborescent lycopods (related to the modern club mosses), the horsetail and conifer ancestors and some seed ferns.

An extensive petrified forest in South Africa which dates from the Permian period was described by Robert Rodin. Unlike the Yellowstone park fossil forest where numerous species of fossils are represented, or the Arizona one where several are found, this African forest was reported to be composed solely of *Dadoxylon,* an early ancestor of the conifers. T. M. Harris (University of Reading, Eng.) described the seed-bearing organ of *Czekanowskia,* a Jurassic plant believed to be related to the modern ginkgo, although in the clustered arrangement of its numerous slender leaves the plant superficially resembles a pine. Harris showed that the seed organ is a curious two-valved capsule actually so unlike that of a ginkgo that it cannot be placed in that family, or indeed, any other existing family of plants. Apparently this represented a line of plants that failed to survive and its closely related contemporaries had not yet been excavated by the palaeobotanist's pick.

Palestine: *see* ISRAEL; JERUSALEM; JORDAN.

Panamá.

A republic on the isthmus joining the continents of North and South America, Panamá is bounded on the north by Costa Rica and on the south by Colombia, and is bisected by the Panama Canal Zone, which is leased to the United States. Area: 28,575 sq.mi.; pop. (preliminary figures, 1950 census of the Americas): 801,982, both exclusive of the Canal Zone. The capital is Panamá city (146,117 in 1949); other principal cities are Colón (54,334), David (13,656) and Santiago (6,944). Language: Spanish; religion: predominantly Roman Catholic. Presidents in 1951: Arnulfo Arias Madrid, until May 10; thereafter, Alcibiades Arosemena.

History.—For Panamanians, 1951 was marked by chaotic political instability. The tension was heightened early in January with the return from exile of former President (1941–1945) Ricardo de la Guardia, with the politically strategic national police chief, José Remón, appearing to hold the balance of power between the followers of the mutually hostile De la Guardia and President Arias. The cabinet was reorganized on Feb. 22 to strengthen Arias' hand for the crisis. Early in March the government closed down the Federal Trust company, Panamá's only privately owned bank. Opposition party leaders on March 8 called for a general strike in protest against that measure, and De la Guardia announced his support of the strike. He was arrested the following day. On March 10 De la Guardia was sentenced to 15 days' imprisonment on charges of publicly expressing contempt of President Arias; De la Guardia was released on the same day when a higher court ruled that his arrest had been illegal. Arias' position in the struggle was further weakened on April 10, when the Panamanian supreme court declared that his 1950 order removing all Communists from public office was unconstitutional.

PRESIDENT and Mrs. Arnulfo Arias Madrid leaving the presidential palace in Panamá city in May 1951, after a popular revolt which unseated him from office. He was later tried and convicted of abusing the 1946 constitution of Panamá and was barred from public office for life

Early in May, a large-scale run on the government-supported savings bank deepened the crisis. Sixteen persons, including former President de la Guardia and Roberto Arias, the president's nephew, were jailed on May 6, charged with inciting the bank run with subversive purposes. The next day, President Arias suspended the constitution of 1946, declaring that the 1941 constitution, authoritarian in pattern, would again be in force. This action touched off the long-brewing climax: national police chief Remón on May 10 turned against Arias, who was overthrown amid disorders in which 16 were killed. Arias was at length captured by the rebels led by Remón; and on May 11 Vice-Pres. Alcibiades Arosemena assumed the presidency.

Arosemena proceeded to form a cabinet representing all Panamanian political groups except the Communists and to pledge full co-operation with the United States. On May 25 former President Arias was declared guilty of abusing his constitutional powers while in office. (G. I. B.)

Education.—In the school year 1951–52 there were 904 public primary schools with 3,153 teachers and 110,038 pupils, 20 secondary schools with 718 teachers and 15,963 students and 7 vocational schools with 253 teachers and 5,552 students. In addition, there were 70 private primary schools with 200 teachers and 5,544 students and 57 secondary schools with 292 teachers and 5,474 students. The national university had 1,805 students.

Finance.—The monetary unit is the balboa, at par with the U.S. dollar. The national budget for 1951 estimated expenditure at $33,464,433 and revenue at $33,464,354. The national debt on Aug. 31, 1951, totalled $32,849,508, of which $11,134,487 was external and $21,715,021 internal. Currency in circulation on June 30, 1950, amounted to $1,500,000. Demand deposits were $22,800,000 on June 30, 1951, and time deposits $17,000,000.

Trade and Communications.—Domestic exports in 1950 totalled $10,140,912; imports $67,055,745 and re-exports $4,966,778. Chief domestic exports were bananas (57%), abacá (15%) and cacao (12%). The leading customers were the U.S. (91%), Colombia (3%) and the Netherlands (2%); leading suppliers were the U.S. including the Canal Zone (71%), Chile (7%), the United Kingdom (3%) and Canada (3%). The traditionally adverse balance of trade is generally offset by invisible exports to the Canal Zone in the form of tourist expenditures, sales to ships and wages of Panamanians employed there.

Railroad mileage is 223. Highways in 1949 totalled 1,071 mi., of which 348 mi. were paved. According to *Lloyd's Register of Shipping*, the merchant marine consisted of 573 vessels (100 tons and over) aggregating 3,361,339 gross tons on June 30, 1950.

Agriculture.—Exports of bananas in 1950 were 5,008,776 bunches, all of which went to the U.S. Exports of other export crops included abacá 3,390 short tons; cacao 2,095 tons; and coconuts 6,051,900 nuts. Production of rice (milled) was about 60,000 tons and sugar, 14,346 tons. The 1950 census showed 576,488 cattle and 198,511 pigs.

Manufactures.—Production figures in 1950 included cement 56,186 short tons; beer 3,459,000 gal.; and soap about 4,500,000 lb. In 1950, 70,831,000 kw.hr. of electric energy were generated in Panamá city and 14,005,000 kw.hr. in Colón. (J. W. Mw.)

Panama Canal Zone. A United States military reservation embracing a ten-mile strip across the Isthmus of Panama, leased for the protection and administration of the Panama canal. the Panama Canal Zone has an area of 553 sq.mi., including 191 sq.mi. of fresh water. Population, exclusive of uniformed military personnel (1950 census): 52,822. Administrative centre: Balboa Heights (pop., 1946: 12,623). Governor in 1951: Brig. Gen. Francis K. Newcomer.

History.—Controversy over the defensibility of the Panama canal was aired in the U.S. press during 1951. In its issue for Jan. 20, the weekly *Collier's* magazine carried an article declaring that the canal was not properly defended. Pentagon officials responded by pointing out that military planes from U.S. bases could reach the canal within six hours; that the canal was beyond the range of any soviet-based plane large enough to carry an atomic bomb; and that the canal was equally unprotected at the start of World War II, but was swarming with men and equipment within a week. (G. I. B.)

Education.—In Feb. 1950 there were for white students 14 schools with enrolment of 4,511 students and a junior college with enrolment of 206 daytime students. For nonwhite students there were 14 schools with enrolment of 3,412 and a normal training school.

Finance.—Total canal revenues for the fiscal year 1949–50 were $24,810,323.78; net expenses, $22,557,703.54; and net capital investment as of June 30, 1950, $672,962,142.67. During the year 5,448 ships (300 net tons and over) aggregating 28,013,236 canal net tons passing through the canal carried cargo of 28,872,293 long tons and paid tolls of $24,430,206. Of the cargo carried, 9,483,863 tons were east to west and 19,388,430 tons west to east. Canal net tonnage of vessels by nationality included U.S. 19,526,719; British 5,154,273; Norwegian 2,085,425; Panamanian 901,570; and Honduran 881,708. Employees of the canal and the railroad on June 30, 1950, included 4,322 paid at U.S. rates and 14,470 paid at local rates. (J. W. Mw.)

Pan American Union: *see* ORGANIZATION OF AMERICAN STATES.

Paper and Pulp Industry. The estimated production of paper and paperboard in the United States for 1951 was about 26,500,000 tons as contrasted with 24,300,178 tons in 1950.

Table I.—*U.S. Production and Consumption of Paper, Wood Pulp and Pulpwood*

In production and consumption, both on a tonnage and a per capita basis, all previous records were broken. In all production aspects the volume of the United States industry exceeded that of 1939 by more than 100%.

Canada.—The demand for all pulp and paper products pressed the output capacity of Canadian mills to the limit in 1951. The production of papers of all kinds was about 6,000,000 tons. Canada exported about 4,775,000 tons of newsprint to the United States.

Table IV.—*Canadian Paper and Paperboard Production*

United Kingdom.—The paper industry in the United Kingdom was plagued in 1950 with rising costs and raw materials shortages. In the middle of 1950 government controls were removed from all paper and board except newsprint, mechanical printing paper and linerboard. The consumption of paper products in the first 11 months of 1950 was about 2,615,000 short tons. The total paper imports were 736,000 tons and the total paper exports for the year were 298,000 tons. The consumption by the industry in the first 11 months of 1950 in short tons was as follows: pulpwood 300,000; wood pulp 1,368,000; esparto 295,000; rags 135,000; straw 99,000; and waste paper 882,000. (*See* also FORESTS.) (R. G. M.)

Papua: *see* COMMONWEALTH OF NATIONS.

Paraguay. A landlocked republic in central South America, Paraguay is bounded north and east by

Brazil, south by Argentina and west by Bolivia. Area: 157,047 sq.mi., of which 95,338 sq.mi. constitute the sparsely populated Chaco, while 61,709 sq.mi., lying east of the Paraguay river, contain 95% of the population and activity. Pop. (1950 census): 1,406,000. The people are a homogeneous mixture of Spanish and Guaraní stock (with some Portuguese and Italian) which has developed into a racial type. Official language, Spanish. The Guaraní tongue has survived more than the blood, but is secondary and recessive. Capital and chief centre: Asunción, pop. (1948) 130,067. Other cities: Villarica (31,081), Concepción (16,487), Encarnación (16,078). Official religion: Roman Catholic. At the end of 1951 the president was Federico Chaves.

History.—There were no significant political changes in 1951. After the protracted civil wars of 1947 and 1948 a condition of stability gradually supervened in 1949 and 1950; and the Democratico Colorado party had prevented any political activity by the Liberales, the Franquistas and the Communists. Its longtime chief, Federico Chaves, was president, and the unicameral congress was composed wholly of his chosen supporters. The outstanding development of 1951 was the government's strong and extensive effort to build a managed economy, with numerous controls and regulations of the various activities of many classes of the people. It launched a plan for the resettlement in Paraguay, in the border regions, of the estimated 300,000 Paraguayans who had during the past two decades migrated to neighbouring countries; but the economic and political factors involved had not been clarified.

Education.—In 1949, 1,262 primary schools were recorded, with 5,479 primary school teachers and 186,101 pupils. There were 41 secondary schools, including 12 normal schools. There were in 1951 four regional agricultural schools; and at San Lorenzo, near Asunción, the Estigarribia National School of Agronomy. A national junior college at the capital had several hundred students, and the National university at Asunción had in 1950 approximately 1,800 students and 100 professors.

Finance.—The currency unit is the guaraní, devalued March 5, 1951, from 3.09 to 6 per U.S. dollar. For business purposes the governmental bank, which controls all foreign exchange, bought and sold dollars at rates ranging up to 9 guaranies. No budget figures were available after 1948 when the revenues were $15,000,000, with expenditures at $24,000,000. In 1950 new bond issues aggregating $5,000,000 (at parity conversion rates) were authorized. The external debt was reported at the end of 1949 as $14,000,000, with internal funded debt and outstanding obligations at about $34,000,000. The budget for 1951 was unofficially estimated at 40% higher than in 1950, but the uncertainties as to the conversion rates of the guaraní clouded such calculations. In 1950 the currency in circulation rose from about $43,000,000 to about $63,000,000 (conversion at parity). At the end of 1950 the reserves of gold and foreign exchange were about $5,000,000.

Trade.—Exports in 1950 were 366,154 metric tons, valued at $55,800,000 (conversion from guaranies at official parity). Imports in 1950 were valued at $28,280,000. The leading export was timber, followed by cotton, quebracho, meat products and hides. The principal imports were nontropical foodstuffs, textiles, machinery and metal manufactures, vehicles, chemicals, petroleum products and paper. The chief destinations of exports were Argentina, the United States, Uruguay, England and the continent of Europe. The chief sources of imports in 1950 were Argentina 35.8%, the United States 24.2%, the United Kingdom 7.5%, Brazil 4.9% and Uruguay 3.6%.

Communications.—The Paraguay Central railway runs 278 mi. S.E. from Asunción through the best farm and forest areas, to Encarnación on the upper Paraná, where it connects by car ferries with the Argentine railways at Posadas. Traffic in late years averaged about 2,000,000 passengers and 227,000 metric tons of freight annually. There were more than 500 mi. of modern gravel-crowned highways, plus 80 mi. of asphalt, with about 4,000 mi. of primitive roads for ox-drawn traffic. The number of automotive vehicles at the beginning of 1950 was 3,150, of which 1,800 were passenger cars, 1,000 were trucks and 300 were buses. While river activity is great everywhere in Paraguay, the Argentine Dodero line between Asunción and Buenos Aires carried by far the largest volume, the last estimate (1948) being 440,000 metric tons. There were 5,111 telephones in Paraguay at the beginning of 1951; and the national telegraph system had 3,700 mi. of wire and joined 118 population centres. There were several broadcasting stations at Asunción, and between 25,000 and 30,000 radio receiving sets.

Agriculture.—The production of the leading agricultural crops in 1950, in metric tons, was as follows: mandioca 750,000; maize 115,000; sweet potatoes 77,000; cotton 41,681; beans 20,000; rice 18,000; sugar 16,000; and tobacco 10,000. The 1950 orange crop was 12,125,000 boxes. Cattle declined to 3,400,000 head in 1950 as compared with 5,000,000 head in 1947.

Manufactures.—Aside from meat packing, the only industry of any consequence is textile manufacturing. The three large mills had 30,230 spindles in 1950, with 514 looms; and produced 2,500,000 metres of cotton cloth, as well as 1,600 tons of cotton yarn. Asunción had flour mills, oil-crushing mills, a brewery and plants which produced shoes, furniture, soap, glass, matches, cigarettes and processed foods. A ceramics plant was opened in 1951 to produce dishes.

Mines and Forests.—The production of lime in 1950 was 25.340 metric tons. The production of cobblestones and crushed stone reached about 60,000 cu.m. Exports of hardwood in the first nine months of 1950 amounted to 186,850 metric tons, valued at between $6,000,000 and $8,000,000.

(W. Ft.)

Parents and Teachers, National Congress of: *see* Societies and Associations, U.S.

Paris. Capital and largest city of France, Paris had in 1946 a population of 2,725,374. President of the municipal council in 1951: Pierre de Gaulle and (from Nov. 19) Paul Coirre.

The main tourist attraction of 1951 was a series of festivities of every variety—artistic, historic, academic, diplomatic, commercial—organized in honour of the 2,000th anniversary of the city's founding. This Paris Bimillenary celebration, as it was called, lasted from early spring till mid-December and attracted more than 1,000,000 foreign visitors, in addition to great numbers from other parts of France.

The United Nations sixth general assembly opened in November at the Palais de Chaillot, greatly enlarged for the occasion.

The reopening in December of three subway stations that had been closed during World War II, and the reintroduction of midnight service on certain bus lines, also suspended since 1940, were welcome decisions.

For the most urgent of all the city's problems, housing, no solution was in sight. By the end of the year more than 100,000 unsatisfied priority requests had accumulated, and it was officially recognized that more than 25,000 permanent residents were living in exorbitantly priced furnished rooms. Apartment construction, except in the high rental class underwritten in advance by the future owners, was at a standstill.

An inflationary rise in the cost of living which, on Nov. 30, registered an index figure of 140, as compared with 100 in 1949, was accompanied by manifestations of discontent among the

PRES. VINCENT AURIOL of France escorting Margaret Truman into the Comédie Française theatre in Paris during Miss Truman's tour of Europe in the spring of 1951 workers. A two-week bus and subway strike in the spring, followed by several short stoppages in the metal trades, resulted in a union demand that the basic monthly salary be raised from 18,225 fr. to 20,000 fr. This was granted in September.

The city's original budget for 1951 of 47,050,000,000 fr. was increased in December to 53,127,000,000 fr.

Parliament, British.

The 39th parliament of the United Kingdom, elected on Feb. 23, 1950, reassembled on Jan. 23, 1951, after the Christmas recess. Both houses rose for the summer recess on Aug. 2 only to return on Oct. 4 for the act of prorogation. During the recess the prime minister, Clement R. Attlee, announced that a general election would be held Oct. 25.

The narrow Labour majority of the 1950–51 parliament was replaced by a Conservative majority of 17 over all other parties. The Conservatives and their allies obtained 321 seats, Labour 295, Liberal 6, Irish Labour 1 and Irish Nationalists 2. The Conservatives, under Winston Churchill (*q.v.*) (Woodford), formed a government, their first since July 1945. (*See* also GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.)

The 1950–51 parliament divided 234 times, resulting in five government defeats, three of them in 1951.

The 40th parliament met on Oct. 31. Its first act was to elect William S. Morrison (Conservative, Cirencester and Tewkesbury) as speaker. In the first contested election for the speakership since 1895, he received 318 votes to 251 for Maj. James Milner (Labour, South East Leeds). Sir Charles MacAndrew (Conservative, Bute and North Ayrshire) was elected chairman of ways and means and R. Hopkin Morris (Liberal, Carmarthen), deputy chairman. In the house of lords Lord Simonds succeeded Viscount Jowitt as lord chancellor and the Earl of Drogheda was re-elected lord chairman of committees. In the first session of the new parliament until Dec. 7 there were 26 divisions in the house of commons; the government received majorities ranging from 22 to 79. (*See* also CABINET MEMBERS; LAW.)

Patents.

During 1951 the United States patent office granted 48,719 patents, including 4,164 for designs, 58 for plants and 134 reissues. This was an increase of 710 over the 48,009 total for 1950.

Applications for patents filed in the patent office for the calendar year 1950 totalled 74,295; for the first 11 months of 1951 the number filed was 59,295. In Dec. 1951, approximately 200,000 applications were pending in the patent office, of which about 105,000 were awaiting action by the office, the remainder being under rejection awaiting response by applicants, or in interference or on appeal.

Trade-marks registered (17,380) and renewed (3,350) during 1951 totalled 20,730. This compared with 20,393 registrations and renewals in 1950. In addition, 1,297 registrations were republished. Applications for registration, republication and renewal for the first 11 months of 1951 totalled 18,192, compared with 23,042 for the entire preceding year. Approximately 35,000 trade-mark applications were pending in the office in Dec. 1951, of which about 16,000 were pending before the examiners.

At the end of 1951, the patent office had granted more than 2,580,000 patents, of which slightly less than 600,000 were unexpired. More than 58,000 unexpired patents were listed on the register of patents available for licensing or sale—the new listings being published in the weekly issues of the *Official Gazette*. During the year ended June 30, 1951, more than 7,500,000 copies of United States patents and trade-marks were distributed, of which more than 1,000,000 were sent to libraries in the United States, and more than 1,500,000 to other countries under exchange agreements.

Major administrative accomplishments and public service improvements during the year included the preparation and printing of a revised edition of the *Roster of Attorneys and Agents Registered to Practice Before the U.S. Patent Office*, which was completed in Sept. 1951 and placed on sale Oct. 1, 1951; completion of a project in the search room to improve reading conditions through modernization of lighting facilities for the benefit of attorneys, inventors, engineers and others; accelerated disposal of the backlog of appeals pending before the patent office board of appeals through the designation of additional temporary examiners-in-chief authorized by a law enacted March 4, 1950; and establishment of a procedure for administration of a temporary act approved June 30, 1950, which provided a one-year period within which veterans could apply for extensions of the terms of their patents. One hundred and fifty-one applications were filed under the act, but the number of patents which might eventually be extended would not be known until final disposition of all applications was made.

Abstracts of abandoned patent applications published in the *Official Gazette* during the year ending June 30, 1951, pursuant to a commissioner's notice dated Jan. 25, 1949, totalled 314.

Net receipts for the fiscal year ended June 30, 1951, were $5,320,224.87. Obligations incurred under all patent office appropriations amounted to $11,248,330, as compared with $11,023,035.67, for the preceding year. (J. A. ML.)

Peaches: *see* FRUIT.

Peanuts.

The U.S. 1951 crop of picked and harvested peanuts amounted to 1,595,025,000 lb., about 21% less than average or the 1950 crop. The 1,990,000 ac. harvested were 12% fewer than in 1950 and far below the 2,923,000-ac. average for 1940–49, but nevertheless in excess of the national allotment of 1,889,000 ac. The yield was 802 lb. per acre as compared with a record 893 lb. in 1950 and an average for 1940–49 of 704 lb.

The Virginia-Carolina area harvested a 10% larger crop than in 1950 from about the same acreage—Virginia set a new record yield of 1,550 lb. per acre.

The announced minimum average support price for peanuts grown on allocated quota acreage was $230.56 per ton (11.5 cents per pound) as compared with $216 per ton (10.8 cents per pound) in 1950, but the price on nonquota units was expected to be lower than in 1950, giving an estimated over-all price to farmers of 10.5 cents per pound for the crop as compared with 10.9 cents in 1950.

Civilian consumption of shelled peanuts was expected to be

Table I.—*U.S. Peanut Production by Leading States*

(In thousands of pounds)

State	1951	1950	Average 1940–49
Georgia	569,320	680,680	690,583
North Carolina	287,500	246,100	311,000
Virginia	226,300	221,920	188,021
Alabama	202,320	324,950	310,160
Oklahoma	111,000	125,080	98,328

Florida	61,200	59,040	64,736

Table II.—*World Peanut Production for Leading Areas*

(In thousands of short tons)

Country	1951*	1950	Average 1935–39
India	3,500	3,731	3,820
China	—	—	2,917
French West Africa	854	661	876
United States	798	1,011	615
Nigeria and Cameroons	600	400	355
Indonesia	300	283	289

*1951 data are preliminary.

4.4 lb. per capita in 1951. Exports from the U.S. of 48,000,000 lb. of peanuts and 2,000,000 lb. of peanut oil were sharply lower than in any late year and it was anticipated that exports would be still smaller from the 1951 crop.

World peanut or ground nut production, preliminarily estimated at 11,300,000 tons, was a near record, if not a new record, a very good crop in Africa offsetting smaller crops in India and the United States. Larger world exports of peanuts and peanut oil from the 1951 crop were anticipated.

A government bill to write off a loss of £36,500,000 on the Tanganyika peanut project was a major test which the Labour government of Great Britain survived early in the year.

(J. K. R.)

Pears: *see* FRUIT.

Pearson, Lester Bowles

(1897–), Canadian government official, was born April 23 at Toronto, Ont. After serving in World War I he graduated from the University of Toronto, attended Oxford university on a Massey fellowship, and returned in 1923 to Toronto as lecturer in and assistant professor of history. Five years later he entered the Canadian department of external affairs as a first secretary. By 1941 he had become assistant undersecretary of state for external affairs; by 1942 minister-counsellor at the Canadian legation in Washington, D.C.; by 1945 Canadian ambassador to the U.S.; and in 1946 was back in Ottawa as undersecretary of state for external affairs.

In 1948 Pearson entered the political arena, being appointed to the cabinet post of secretary of state for external affairs and winning the Algoma East (Ont.) seat in the house of commons. He led the Canadian delegation to the United Nations general assembly in 1949, and was elected chairman of the U.N. political and security committee.

During 1951 he attended the fifth session of the U.N. general assembly and explained Canada's position respecting Korea; at the sixth U.N. session he outlined Canada's reaction to the disarmament proposals. He signed the Japanese peace treaty, on behalf of Canada, at San Francisco, Calif., and attended two meetings of the North Atlantic treaty council, being chairman at the meeting in Rome. (C. CY.)

Pennsylvania.

A middle Atlantic state and one of the 13 original states of the union, Pennsylvania is popularly known as the "Keystone state." Area: 45,333 sq.mi., including 288 sq.mi. of inland waters. Pop. (U.S. census, 1950): 10,498,012. Capital: Harrisburg (89,554). Cities with a population greater than 75,000 in 1950: Philadelphia (2,071,605); Pittsburgh (676,806); Erie (130,803); Scranton (125,536); Reading (109,320); Allentown (106,756); Altoona (77,177); Wilkes-Barre (76,826). The urban population in 1950 numbered 7,403,036, and the rural 3,094,976.

History.—The 139th regular session of the general assembly, which convened on Jan. 2, 1951, and adjourned Dec. 22, 1951, proved to be the longest in the state's history, because of the difficulty of providing the additional revenue made necessary by the rising costs of government.

Laws written on the statute books during this session created a Delaware river port authority, authorized the construction of a new bridge to span the Delaware, established a state council of civil defense and provided for the reapportionment of the state's representation in congress.

An amendment to the state constitution adopted at the general election of Nov. 6 authorized the county and the city of Philadelphia to consolidate their separate governments. In December the general assembly enacted a law providing the means for effecting a union of the county and city authority.

The completion, in Dec. 1951, of the western extension of the Pennsylvania turnpike provided an all-weather, limited access highway, 327 mi. in length, between the eastern seaboard and the Ohio valley.

The state's chief officers in 1951 were: John S. Fine, governor; C. Lloyd Wood, lieutenant governor; William S. Livengood, Jr., secretary of internal affairs; Weldon B. Heyburn, auditor-general; Charles R. Barber, treasurer; Robert E. Woodside, attorney general; Francis B. Haas, superintendent of public instruction; and James B. Drew, chief justice. Thomas McK. Chidsey, Charles Margiotti and Robert E. Woodside were, successively, attorneys general during the year.

Education.—Statistics for 1949–50, the latest year for which complete figures were available in 1951, showed a net enrolment of 1,558,602 pupils in the public schools of Pennsylvania, including 58,464 in the kindergartens, 940,538 in the elementary division and 559,600 in the secondary schools. There were 843 kindergarten teachers, 30,339 elementary teachers, 24,242 giving instruction in high schools, 1,364 elementary principals, 873 secondary principals, 1,920 supervising officials and 1,561 other professional employees. The total expenditure, including current expense, capital outlay and debt service, was $364,863,003, of which $293,903,936 was for current expenses. School districts supplied 60.7% of these costs from local taxation, while the state government contributed 37.9% and the federal government 1.4% for current operating expenses.

Social Insurance and Assistance, Public Welfare and Related Programs.—During 1951 expenditures by the department of public assistance totalled $125,000,000, including $71,000,000 state funds and $54,000,000 federal funds. The assistance rolls contained an average of 79,000 old-age assistance cases, 38,000 cases receiving aid to dependent children, 24,000 general assistance cases, 15,000 blind pensioners and 9,000 cases receiving aid to the permanently and totally disabled.

Three institutional systems are maintained and operated for the commonwealth of Pennsylvania by the department of welfare.

Eight institutions comprise the state penal and correctional system, for the support of which a biennial appropriation of $15,773,000 was made for 1951–53. For the operation of the state mental hospital system, comprising 21 institutions, an appropriation of $81,250,000 was made for the biennium. An appropriation of $9,750,000 was made for the biennium for the operation of the ten general hospitals comprising the state general hospital system.

Communications.—Of the approximately 100,000 mi. of highways in Pennsylvania in 1951, 41,000 mi. were on the state highway system under the supervision of the department of highways. Included in this state highway total were 675 mi. in the cities of Pennsylvania and 2,179 mi. in the boroughs. As of Dec. 31, 1951, 39,800 mi. were of improved type, leaving 1,200 mi. unimproved. In addition, there were 327 mi. of superhighway operated by the Pennsylvania Turnpike commission.

Banking and Finance.—As of June 30, 1951, there were 351 state banks, including 8 savings banks, with assets of $5,684,770,830.75. These state banks had total deposits of $5,100,163,261.25. In addition, as of Dec. 30, 1950, there were 778 building and loan associations, with assets of $588,133,540.51. As of June 30, 1951, there were 622 national banks located in Pennsylvania, with assets of $7,507,106,000. The deposits of these national banks totalled $6,736,611,000.

The total of appropriations made by the general assembly from the general fund was $892,264,005.06. This amount, however, was at the close

Table I.—*Principal Crops of Pennsylvania*

Crop	1951	1950	Average 1940–49

Tobacco products	140,780,600	92,272,300
Lumber and its remanufacture	323,311,900	79,733,100

of 1951 still subject to reduction by the governor in his approval of appropriation measures. Appropriations and allocations from the motor licence fund for the biennium ending May 31, 1953, were $363,867,314. The estimated receipts from the motor licence fund were $362,643,400. The gross debt Sept. 30, 1951, was $517,000,000, which cash and securities in the sinking fund reduced to a net of $502,454,876.

Agriculture.—The total gross farm income for 1950 was $738,716,000, including $732,434,000 in cash receipts from farm marketing and $6,282,000 in federal government payments.

Manufacturing.—In 1950 there were 20,001 manufacturing establishments in the state, employing 1,222,948 persons to whom $5,142,968,500 was paid in wages and salaries. The capital invested was $6,221,707,200 and the value of the goods produced was $19,484,852,500. Included as part of the latter amount, value added by manufacture was $8,193,667,700. The value of the product of the principal industries for 1940 and 1950 is shown in Table II. (J. S. Fe.)

Mineral Production.—Table III shows the tonnage and value of mineral production in the state in 1949 for commodities having values in excess of $100,000, and corresponding data for 1950, so far as they were available at the close of 1951. Pennsylvania ranks third among the states in value of its mineral production, mainly because of the heavy output of bituminous and anthracite coal.

Table III.—*Mineral Production of Pennsylvania*

(In short tons, except as noted)

Perón, Juan Domingo

(1895–), president of Argentina, was born on Oct. 8 near Lobos, south of Buenos Aires, and was educated in military schools. He became one of the leaders of the G.O.U. (Grupo de Oficiales Unidos), a nationalist clique of young army officers who in 1943 helped overthrow the regime of Pres. Ramón S. Castillo. Perón became war minister and later vice-president under Pres. Edelmiro Farrell, and in 1946 was himself elected president on the Labour party ticket. From 1948 on, progressive political steps were undertaken by Perón's followers to permit him to succeed himself, though this required adoption of a new constitution, since the old specifically forbade it. The constitutional change was accomplished in 1949, and in July of that year Perón was renominated.

A feature of his regime in 1951 was the stifling of the independent newspaper, *La Prensa.* In February, gangs of thugs attacked employees who attempted to enter the plant and police eventually sided with the thugs, forced the employees out of the plant and seized it for the government. U.S. Asst. Secy. of State Edward G. Miller, Jr., told Perón on March 4 that his policies had so antagonized the U.S. public that it was difficult for the U.S. to co-operate with Argentina. On Aug. 22 Perón "agreed" to run for re-election as president. A brief and abortive revolt Sept. 28 was attributed by Perón to disgruntled generals, backed by foreign money. On Nov. 13 Perón was re-elected by a 2-to-1 majority.

(*See* also Argentina.)

Perón, María Eva Duarte de

(1919–), wife of the president of Argentina, was born on May 7 in Los Toldos, Buenos Aires province. After attending high school for two years she went to Buenos Aires, and became a successful actress in radio and motion pictures. She met Juan Domingo Perón, then an undersecretary in the war ministry, in 1943, and helped organize a radio workers' union under his sponsorship. They were married in Oct. 1945 and about four months later Perón was elected president.

Señora Perón thereafter became one of the most powerful figures in Argentina. She founded in 1947 the María Eva Duarte de Perón Welfare foundation, through which was administered a program of social welfare and personal largesse.

On Feb. 23, 1951, she led a delegation that asked Perón to run for re-election, a fact made possible through the revision of the constitution. In April the International Astronomical commission confirmed the naming after her of a small planet, Evita, discovered in Aug. 1948. She told a group of Perón's supporters in May that "He is God for us—our sun, our air, our water, our life."

On Aug. 22 she accepted the nomination to run for vice-president with her husband, but several days later announced her decision to decline the nomination. Opposition was said to have come from the army.

Persia: *see* Iran.

Peru.

A republic situated on the west coast of South America and bounded on the north by Ecuador and Colombia, on the east by Brazil and Bolivia, on the south by Chile and on the west by the Pacific ocean, Peru has an area of 482,258 sq.mi. The population, estimated at 8,405,000 in 1950, is composed approximately of 52% "white" and mestizo and 46% Indian; there are also some Negro and Asiatic elements to the extent of about 2%. Lima, including its suburbs, has a population of about 1,000,000. It is the capital. The population estimates for the other major cities are: Callao 100,000; Arequipa 85,000; Cuzco 45,000; Trujillo 40,000; Iquitos 38,000; Chiclayo 35,000; Huancayo 35,000; Ica 25,000; and Piura 22,000.

History.—The administration of Pres. Manuel Odría, elected July 2, 1950, continued its reform program during 1951 and made progress toward economic and fiscal restoration and development. At the end of 1950, and for the first time since 1946, Peru achieved an active balance of international trade. The 1951 budget made provision for one quarter of the $5,800,000 owing to United States exporters, which was expected to be liquidated entirely by 1954. The national budget was in balance. Exchange stability continued and the net exchange position of the Central Reserve bank improved. Peru became a contracting party to the General Agreement on Tariffs and Trade in October 1951. In November a joint statement by the Foreign Bondholders Protective Council, Inc., of the United States, and the Peruvian government was issued announcing approval by the council of a debt readjustment plan offered by Peru. Upon completion of the offer by necessary legislative and other formal measures the council would undertake to recommend the plan to holders of Peru's outstanding dollar bonds. The Peruvian government was negotiating with the Council of Foreign Bondholders (London) with a view to reaching a similar settlement.

The Government announced a vast new road-building plan and an equally important irrigation plan. The first included a low-altitude highway (7,000 ft.) across the Andes which would open the fertile eastern slopes to development.

(S. de la R.)

Education.—In 1951 there were 9,705 public primary schools with 20,429 teachers and 872,669 pupils and 628 private schools with 2,650 teachers and 85,429 pupils. The 98 public secondary schools had 2,056 teachers and 41,209 students. There were also 148 private secondary schools, some of which were conducted by religious orders, with 1,736 teachers and 21,023 students. University education was available at four public universities—Lima, Arequipa, Trujillo and Cuzco—and the Catholic university of Lima. Appropriations for education in 1951 comprised 15.1% of estimated governmental expenditures.

Finance.—The monetary unit is the sol, valued at 6.45 cents U.S. currency, free rate, on Nov. 17, 1951. The 1951 budget estimated ordinary expenditure at 1,640,943,950 soles and extraordinary expenditure at 297,740,000 soles. Actual revenue in 1950 was 1,728,008,000 soles; expenditure, 1,681,535,000 soles. The direct public debt on Dec. 31, 1950, totalled 1,652,483,311 soles, made up as follows: external dollar and sterling debt (including accrued interest) 402,974,597 soles; internal consolidated debt 546,129,560 soles; internal floating and short-term debt 703,379,154 soles. On Sept. 30, 1951, currency in circulation totalled 1,056,000,000 soles; demand deposits 1,727,000,000 soles; gold reserves $45,700,000; foreign exchange reserves $24,900,000. The cost-of-living index stood at 477 in June 1951 (1937=100).

Trade and Communications.—Exports in 1950 totalled 2,886,761,056 soles; imports, 2,877,286,738 soles. Leading exports in 1950 were cotton (35%), sugar (15%), petroleum and products (13%), lead (7%) and zinc (5%); leading imports, machinery and vehicles (33%), cereals (13%), metals and manufactures (10%), chemicals and products (8%) and textiles (6%). The chief customers were the U.S. (26%), the United Kingdom (17%), Chile (15%), Belgium (8%), and Argentina (4%); leading suppliers, the U.S. (53%), the United Kingdom (17%), Argentina (6%), Australia (3%) and Germany (3%).

Railways (1947) totalled 2,612 mi., of which 511 mi. were state-owned. Roads used by motor traffic on Dec. 31, 1949, totalled 19,468 mi., of which 7,903 mi. were hard-surfaced. Motor vehicles (1949) included 25,148 automobiles, 17,687 trucks and 2,511 buses. According to *Lloyd's Register of Shipping*, the merchant marine had 41 steamers and motorships (100 tons and over) aggregating 86,667 gross tons on June 30, 1950.

Agriculture.—Production figures in 1950 included cotton (ginned) 81,500 short tons; centrifugal sugar 462,000 tons; and rice (milled) 130,000 tons. In 1950, 81,000 short tons of cotton and 320,000 tons of sugar and derivatives were exported. Livestock estimates (1949–50) showed 18,518,000 sheep, 960,000 pigs, 1,092,000 goats, 2,883,000 cattle and (1948) 2,449,746 alpacas and llamas. In 1950, 3,400 short tons of sheep wool and 4,300 tons of alpaca wool were exported.

Mineral Production.—Production of the principal minerals in 1950 was as follows: copper (smelter) 22,409 short tons; gold 125,388 fine oz.; silver 31,469,886 fine oz.; lead (ore) 67,251 tons; zinc (ore) 81,364 tons. Crude petroleum production totalled 15,017,320 bbl.

Petroleum.

Nationalization of the Iranian oil industry in 1951 had political overtones of undetermined significance to the peace of the world. After fruitless negotiations, the Anglo-Iranian Oil company ended operations at Abadan in July and thus withdrew from the world market a daily production of 700,000 bbl. of oil and the finished products of about 500,000 bbl. Yet through the co-operation of the oil industries of other countries this deficiency had been made up by the end of 1951.

Total world production of petroleum was estimated at 3,986,500,000 bbl. in 1951, a new high record, compared with the record-breaking total of 3,796,191,000 bbl. in 1950. The United States, with roughly one-third of the world's oil resources, accounted for 56%. Estimated U.S. production of 2,245,000,000 bbl., compared with 1,971,845,000 bbl. in 1950, was the highest in history.

Table I.—*World Production of Crude Oil*

(In thousands of barrels)

Year	United States	Per cent	Rest of world	Per cent	Total world
1939	1,264,962	61	821,198	39	2,086,160
1940	1,353,214	63	796,607	37	2,149,821

NEW OIL WELL in northeastern Montana which indicated the possibility of a rich new oil source in the Williston basin of that state and North Dakota. The first strike in North Dakota was made in April 1951, the one in Montana in July

Virtually every oil-producing nation showed production increases for the year, except Iran. Venezuela, second to the U.S., had an estimated production of 710,000,000 bbl. compared with 546,783,000 bbl. in 1950, and the middle east itself helped make up the Iranian deficit, with large output increases in Saudi Arabia, Kuwait and Iraq. Despite the loss of Iran, the area was producing about 1,950,000 bbl. daily at the end of the year, with Saudi Arabia approaching a peak of 900,000 bbl. and Kuwait 700,000 bbl. The relatively small petroleum output of another international trouble spot, Egypt, was not affected by the Suez canal issue.

The increased production in the United States, Venezuela and the middle east directly reflected the steps taken to fill the gap made by the loss of Iranian oil, for the bulk of the deficit was supplied from these areas. Profiting by the debacle in Iran, foreign owners revised their concessions in Saudi Arabia, Kuwait and Iraq so that the governments of these countries would receive 50–50 participation of the profits. Previously they had received only royalty payments of the amount produced.

Table II.—*U.S. Production of Motor Fuel*

(In thousands of barrels of 42 gal.)

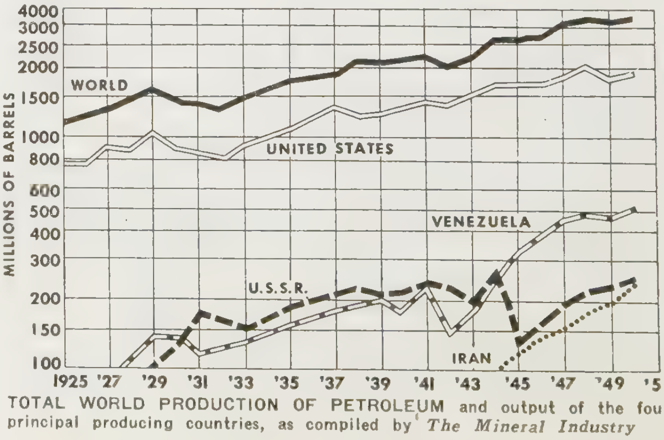
The political unrest in the middle east, however, made uncertain the future availability to the world of what had been determined to be the world's greatest reservoirs of oil. At the end of 1951, middle east reserves were estimated in excess of 50,000,000,000 bbl., almost double those of the United States.

Nor was the ever-present threat to middle east production confined to the countries of oil origin. To secure this oil for oil-starved Europe at reasonable cost, pipe lines had been built to Mediterranean terminals. Lebanon threatened to levy additional taxes against pipe lines from Saudi Arabia and Iraq, terminating at Sidon and Tripoli. And the Suez trouble brought into focus the fact that about 1,400,000 bbl. daily moved through the canal from the Persian gulf.

Although the withdrawal of Iranian oil was a contributory cause to increased U.S. production and refinery operations, the primary reason was enlarged civilian and national defense demands. United States imports from the middle east decreased because Saudi Arabian production was diverted to European markets; nevertheless, there was little change in total imports compared with 1950, these running at 309,000,000 bbl. On the other hand, exports increased, being estimated at 156,000,000 bbl. compared with 110,900,000 bbl. in 1950.

The outstanding discovery of 1951 in the U.S. was the Williston basin in North Dakota following more than 20 years of exploratory effort. Another was the Richey area in Montana.

Frank M. Porter, president of the American Petroleum institute, estimated capital expenditures of the U.S. industry in 1951 at about $3,000,000,000, an increase of nearly 22% over 1950,



TOTAL WORLD PRODUCTION OF PETROLEUM and output of the four principal producing countries, as compiled by *The Mineral Industry* and its total spending since the end of World War II at approximately $15,000,000,000. For the ninth consecutive year, domestic demand for petroleum products increased; total demand in 1951 was estimated at 2,568,000,000 bbl. United States refineries processed 2,372,000,000 bbl. in 1951, a new high record, and refinery capacity reached an all-time high of 7,230,000 bbl. daily, compared with 6,963,000 bbl. at the end of 1950.

Motor fuel production surpassed the 1,000,000,000-bbl. mark for the second time in history. The estimated total of 1,132,400,000 bbl. was an increase of 10.5% over the peak of 1,024,448,000 bbl. in 1950.

Production of gas oil and distillates showed a 19% jump in 1951, rising to an estimated 475,300,000 bbl. Residual fuel oil production went up from 425,217,000 bbl. in 1950 to an estimated 468,400,000 bbl. in 1951. Total production of fuel oil thus exceeded 943,700,000 bbl., a new record. The 1951 total represented an increase of about 119,571,000 bbl. over 1950 and about 83,012,000 bbl. over the previous peak in 1948.

These figures reflected the increase in home heating by oil, the rise in industrial use and the continuing dieselization of the nation's railroads. The number of homes with oil burners rose to an estimated 5,700,000 in 1951. During the first nine months of 1951, all but 16 of the 1,856 new locomotives put into service by U.S. railroads were diesel electrics. (*See* also BACTERIOLOGY; CHEMISTRY.)

FILMS OF 1951.—*Oil Today, Power Tomorrow* (Frith Films); *Struggle for Oil* (British Information Services). (L. M. F.)

Philadelphia. According to the 1950 census, the population of Philadelphia in that year was 2,064,794, while that of its eight-county standard metropolitan area was 3,660,676—representing increases of 6.9% and 14.4% respectively since 1940. The city thus retained its rank as third largest in the United States, while the metropolitan area ranked fourth. Although the number of new dwelling units constructed throughout the metropolitan area during the first five months of 1951 (9,150) was 37% less than for the comparable period of 1950, a total of approximately 43,000 had been made available since the beginning of 1950. About one-third of the single-family structures and a much larger portion of the multifamily structures were built within the city. Commercial construction was characterized by the expansion and modernization of many existing establishments and the introduction of several new ones —particularly a large steel mill in the Moorestown area.

The administration of Philadelphia was Republican; the mayor, Bernard Samuel. A new city charter was adopted, which was to become effective in Jan. 1952.

In 1951 Philadelphia made noteworthy progress on its comprehensive program of public improvements. Projects finished, under construction or started represented expenditures totalling $241,000,000. The $10,000,000 northeast sewage treatment works was placed in service. Improvement of water filtration plants, pumping stations and reservoirs continued. Water mains and sewers were extended and streets paved to serve new homes. The Walnut lane bridge, largest prestressed concrete bridge in the United States, was opened to traffic. Work continued on extension of the Market street subway, including a subway-surface car tunnel, and on equipping the Locust street subway. At the International airport a new terminal building and related construction was about 50% completed. A $7,000,000 pier of the most modern design was added to the port facilities.

The widening of Vine street, a $6,000,000 joint project of the city and the state to provide an adequate approach to the Philadelphia-Camden bridge, was finished. Another joint project, the $13,500,000 Penrose avenue bridge and approaches, was scheduled to open late in the year. Plans for the $80,000,000 Schuylkill expressway were under contract. Nearly all the buildings had been razed to make way for construction of Independence mall.

A new youth study centre for detention and study of juvenile delinquents was scheduled to open before the end of the year. The 720-bed Charles K. Mills neurological building was being equipped for service, and other improvements to hospitals and health centres were under way.

Construction was started in 1951 on two low-rent housing projects and plans for others were in preparation. Philadelphia was the first city in the United States to execute a loan and grant contract for an urban redevelopment project. Redevelopment passed into the construction stage. (B. SA.)

Philanthropy: *see* DONATIONS AND BEQUESTS.

Philately. The long awaited, and often postponed, set of the United Nations stamps finally made its appearance in the final days of 1951. It was valid at only one post office—the United Nations office in the United Nations building. For this limited service there were issued no less than 11 values of ordinary postage and 4 air mail of United Nations stamps—1, 1½, 2, 3, 5, 6, 10, 15, 25, 50 cents and $1 ordinary mail, and 6, 10, 15 and 25 cents air mail. Most official mail, however, was franked.

New Issues.—A change in postal rates was responsible for two new United States stamps—the 2-cent postal card and the 20-cent special delivery stamp. The latter was a reissue of the 20-cent black of 1925, but in a rotary press version (perf. 11 x 10½) instead of a flat-plate type (perf. 11).

The commemorative stamps issued by the U.S. during 1951 were six in number, all three-cent values and all of the special delivery format. They were the Confederate veterans' last encampment issue (grey) on May 31; the centenary of the settlement of Nevada (sage green) on July 14; the 250th anniversary of the landing of Antoine de la Mothe, sieur de Cadillac, at Detroit (blue) on July 24; the 75th anniversary of the statehood of Colorado (violet), Aug. 1; the 75th anniversary of the American Chemical society (violet brown), Sept. 4; and the 175th anniversary of the battle of Brooklyn on Dec. 10.

The Festival of Britain brought two stamps, a two and one-half-penny and a four-pence value. They were withdrawn on the day the exhibition closed. Canada issued a series honouring its premiers. The Windward Islands overprinted their individual stamps for the new constitution. New Zealand issued, as usual, two stamps identical in design but differing in colour, for the health camps. Fiji issued two health stamps. These bore a slight extra charge for the maintenance of the camps.

The Republic of Korea (south Korea) issued a set of 32 stamps honouring the 16 nations that were helping that country. The stamps were all of 500-won value, and showed the flag of the country and Korea (green) or the flag of the country and that of the U.N. (blue).

Sweden issued new stamps for the new king. Finland issued stamps calling attention to the Olympic games, to be held at Helsinki in 1952.

Exhibitions.—The outstanding exhibition for the western hemisphere was held in Toronto, Can. The centenary of the 1851 issue in the United States was marked by a show held at Philadelphia, Pa.

BIBLIOGRAPHY.—The various 1952 editions of the standard catalogues appeared in the fall of 1951. Two German catalogues—Senf and Michel—combined and planned to issue a new catalogue every four years and a supplement each year, to mark the new issues. (M. HA.)

Philippines, Republic of the. This republic, situated in the western Pacific east of Indochina, comprises an archipelago composed of almost

CAPTIVE HUK LEADERS aboard a cruising LCT, where they were kept by the Philippine government in 1951 to block rescue attempts by their followers

7,100 islands, totalling 115,600 sq.mi. Pop.: (1948 census) 19,234,182; (1951 est.) 21,120,000. Manila (pop. [1948] *c.* 1,300,000) is the seat of government, although Quezon City, a suburb of Manila, was designated the official capital in 1948. Other cities are Cebu (167,000) and Iloilo (110,000). About 10,000 U.S. citizens and 12,000 occidentals from other countries live in the islands. The Chinese population exceeds 200,000. Most Filipinos are Catholic in religion (Roman Catholic or native Aglipayan Catholic). In the southern islands live approximately 800,000 Mohammedans, while about 425,000 Protestants and almost 700,000 pagans are widely scattered. President in 1951: Elpidio Quirino.

History.—Changes in financial policy made during 1950 improved the position of the government and the general economy sufficiently that the crisis conditions of 1949 and 1950 receded slightly during 1951 and lessened the economic tensions within the country. Reorganization of executive branches of the government reduced their number and cost. The reforms were not sufficient, in themselves, permanently to stabilize conditions, but were the beginning of a long-range program suggested by the Bell Economic Survey mission of 1950. Careful trade controls, the improved status of export agriculture and continuing reform in government operation all combined during 1951 to promote general economic improvement.

Domestic political problems continued to harass the islands during 1951. The Communist Hukbalahap carried out almost continuous raids on towns and cities in many parts of the main island of Luzon, looting, burning and killing. Continued reorganization of the Philippine army, under a new secretary of defense, Ramón Magsaysay, placed all military forces upon field status. The adoption of aggressive guerrilla tactics and a positive program promising land to dissident elements finally began to reduce the strength and striking power of the Hukbalahap, but by the end of the year only a start had been made in the elimination of the organized rebellious elements. Total Communist forces numbered about 16,000 toward the end of the year.

The year 1951 witnessed an off-year election in which nine senators, all the provincial governors and almost all municipal mayors were elected. In early violent electioneering numerous deaths and personal injuries resulted from fights between opposition groups and the private militant gangs of strong political bosses who attempted to intimidate the populace in an effort to maintain the power of the Liberal party. Prior to the election, President Quirino ordered the Philippine army to maintain the peace and ensure an honest election. The efficient carrying out of this order by Defense Secretary Magsaysay almost split up the Liberal party, but the election was peaceful and relatively honest. The honesty was indicated by the result that all nine senatorial seats, a majority of the governorships and most of the mayoralties were won by Nacionalista party candidates. The election constituted a severe defeat for the Liberal party, and endangered the support of President Quirino in the Philippine congress.

Mount Hibok-Hibok, a 5,620-ft. volcano dominating the 96-sq.mi. island of Camiguin off the north coast of Mindanao in the southern Philippines, without warning erupted repeatedly for several days in early December, killing an estimated 2,000 people, destroying several towns and many farms.

One of the recommendations of the Bell Economic Survey mission of 1950 was that the Philippine government receive financial aid from the United States during a five-year period under an arrangement with the Economic Cooperation administration. This aid was to be conditional upon the passage of a minimum wage law and upon the reorganization of the Philippine tax system to provide a stipulated total revenue. The Philippine congress reluctantly provided final tax legislation during March 1951 which approximately doubled government revenues in the following fiscal year. It also passed a minimum wage law to go into effect in July 1951 which legally guaranteed agricultural labour 87 cents per day and industrial labour $2 per day. The law contained clauses progressively increasing minimum wages during 1952 and 1953.

With the legislative requirements provided, ECA aid began to be made available to the Philippines during the latter half of the year. An Export-Import Bank of Washington technical advisory group began to work with the Philippine government, planning toward important capital investments and productive agricultural and industrial enterprises. The program was to extend over five years, with total aid amounting to $150,000,000.

Production and Trade.—With continued strong emphasis upon agricultural rehabilitation, the over-all acreage of food crops was a little greater and the yield a good deal higher than in any previous postwar year. Of commercial export crops, coconut, sugar cane and manila hemp considerably increased their yields and their export totals, though the yields of tobacco and pineapple dropped slightly. High world market prices for coconut and manila hemp products, and the larger sugar export, were instrumental in promoting an increase in the national income.

An increase in fishing, manufacturing and mining supported the increased productivity of agriculture and, for the first time since the end of World War II, the physical index of production exceeded that of prewar years. The 1951 index stood at approximately 103% of the 1937 base level, though when the added population is taken into account the increase in production still did not equal the prewar per capita level.

The increased volume of agricultural export during the early part of the year gave the Philippines a significantly favourable balance of trade and built up the international dollar reserve balance. With this build-up in prospect the tight import controls established in 1949 were loosened during 1951 and in the latter months of the year an increased inflow of many types of goods took place. By monthly averages this produced an unfavourable balance of trade during the late months of the year, but the annual balance was expected to be close, so that the international economic position of the islands was no longer declining.

The cost-of-living index for Manila rose during the first half of the year to a figure of 367.8 in June, as against a 1941 base of 100. This was the highest point level reached since Sept. 1948, but it declined slightly during the closing months of the year to 358.0 for October, as a result of lightened import controls and the greater availability of essential consumer goods. (J. E. Sp.)

Philosophy.

Philosophy was influenced considerably in 1951 by social circumstances and the course of political events. The world's tensions and anxiety were clearly reflected in philosophy's increased sense of responsibility to both the individual and society. There was a genuine concern for the cultivation and preservation of moral and spiritual values and an interest in contributing to the foundations of a more stable social order. Efforts were directed toward improved intercultural understanding, a more adequate moral and political theory and more meaningful interpretations of personal experience. These practical interests, however, did not lessen the analytical activity of philosophy in highly specialized problems, or prevent the appearance of theoretical and speculative works.

There was in 1951 an increase in the exchange of scholars between western nations and between the orient and occident. Many western philosophers travelled, studied and lectured in the orient, particularly India, southeast Asia and Japan, while a considerable number of oriental philosophers, especially Indian and Chinese, were lecturing before western audiences or studying in western schools. Indicative of the interest in the philosophy of culture and intercultural relations was Ralph Tyler Flewelling's *Conflict and Conciliation of Cultures,* a search for world understanding and unity on the ground of the intrinsic worth of personality. A volume of essays on Indian, Chinese and western philosophy by 21 scholars entitled *Rādhākrishnan: Comparative Studies in Philosophy in Honour of His Sixtieth Birthday* was published in honour of the Hindu philosopher-statesman Sir Sarvepalli Radhakrishnan.

Other important contributions in this field were *The Philosophy of S. Rādhākrishnan* in the "Library of Living Philosophers," edited by P. A. Schilpp, and *Essays in East-West Philosophy,* edited by C. A. Moore, a report of the second East-West Philosophers' conference held at the University of Hawaii, Honolulu, in 1949. *Philosophy East and West,* a new journal of oriental and comparative thought, made its appearance in April at the University of Hawaii.

The most significant work in political philosophy published during 1951 was George Santayana's *Dominations and Powers,* the matured insight and reflection on human affairs of a philosopher who has held himself aloof from the world he appraises. *The Human Community* of Baker Brownell was a study in the structure and values of community living and the problem of its disintegration in modern society. Lewis Mumford's *The Conduct of Life* expressed a philosophy of hope in the midst of cultural crisis. Bertrand Russell's *The Impact of Science on Society* was an entertaining and provocative affirmation of science and its cultural implications.

In a world increasingly oriented in terms of science, the serious age-old question whether a science of values is possible was debated. Stephen E. Toulmin's *Examination of the Place of Reason in Ethics* contributed to the analysis of the moral problem.

During 1951 philosophical scholarship continued its research in the history of ideas. Although published in 1950, of wide influence was *The Problem of Knowledge,* the fourth volume of the monumental history of philosophy by Ernst Cassirer, an impressive study of a century of philosophic thought from the death of Hegel to 1932.

Analytical and scientific philosophy, with attention directed toward language, logic, methodology and meaning, gave evidences of increasing maturity. *Philosophical Analysis,* a volume of essays by British and American writers edited by Max Black, presented significant examples of logical analysis. Rudolf Carnap's important *Logical Foundations of Probability* developed a logical system of probability and a theory of induction. The logical writings of the U.S. philosopher Josiah Royce were published under the title *Logical Essays,* edited by Daniel S. Robinson. Hans Reichenbach presented the case for scientific philosophy as against the traditional speculative philosophy in a historical and analytical work *The Rise of Scientific Philosophy. Structure, Method and Meaning,* a collection of essays in honour of the logician Henry M. Sheffer edited by Paul Henle and others, *Knowledge and Perception* by H. A. Prichard and *The Structure of Appearance* by Nelson Goodman were important contributions to the analysis of knowledge and meaning. The Institute for the Unity of Science, which held its first national conference in 1951, began a series of publications devoted to the problem of knowledge. The first issue was entitled *Contributions to the Analysis and Synthesis of Knowledge.* The sixth edition of the *Vocabulaire technique et critique de la philosophie* was published in France under the editorship of André Lalande.

Positivistic philosophy by 1951 was showing signs of moderation, but there was no decrease in its vigorous opposition to metaphysics. Richard von Mises' *Positivism* and a monograph by J. Jørgensen, *The Development of Logical Empiricism,* were published during the year. Metaphysics, however, enjoyed a minor rebirth and there were many evidences that speculative philosophy was not dead. The Carus lectures of C. J. Ducasse, *Nature, Mind and Death,* was regarded as one of the most important publications of the year. W. D. Oliver's *Theory of Order* contributed to the analysis of knowledge and metaphysics. *Cosmology* by E. Finlay Freundlich indicated the trend of scientifically oriented cosmology.

Existentialism with a concern for the individual, the tragic and the nonrational, continued to express itself primarily in nonacademic philosophy. *Faith and Reality,* volume 2 of *The Mystery of Being,* the Gifford lectures of the French philosopher Gabriel Marcel, was its major literary product. Marcel's problem was whether anything of absolute rather than relative importance is at stake in the life of the individual.

The most significant publication in religious thought for the year was the first volume of Paul Tillich's *Systematic Theology.*

The general vitality of academic philosophy was indicated by an increase in the number of formally organized philosophical associations, some with specialized, others with general, interests. In the colleges and universities, philosophy continued to play an important role as the core of many general education programs that were introduced to ensure a liberal education in the presence of increased academic and technological specialization. Several new philosophical journals were already playing an important role in the dissemination of ideas, including the *Philosophical Quarterly* and the *British Journal for the Philosophy of Science* in England, and *Philosophical Studies* in the United States.

In the summer of 1951 the United Nations Educational, Scientific and Cultural organization addressed an "Enquiry into the Teaching of Philosophy" to the national commissions of its co-operating countries to determine the influence of philosophy on the individual and society. The study was in the interest of world peace and human rights.

Photography.

The outstanding photographic event of 1951 in Europe was the world's largest photographic exhibition, the Photo-Kina fair at Cologne, Ger. In 500,000 sq.ft. of exhibit space, 340 exhibiting German firms and 14 other countries were represented. More than 100,000 paid for admissions. Some of the new products shown included the Leitz professional 16-mm. projector equipped with a 20-v., 20-amp. projection lamp and mirror optical system for 2 x 2-in. slide projection. The increasing popularity of the 35-mm. camera was emphasized by the many new and improved cameras in this miniature size. The former Kine Exakta was redesigned and shown as the Exakta Varex, with a simplified model called the Exa. The German Ucaflex was a new eye-level reflex camera in the 35-mm. film size. Improved Robot cameras and the new Kodak Retina models were shown. In addition to the Leica, Contax and Agfa Karomat cameras, there were many new inexpensive 35-mm. cameras such as the Radix, Balda, Diax and Perlux. A new company, the L. King company of Bad-Liebenzell, introduced its 35-mm. Regula camera of conservative design and reasonable price.

There were many new lenses, camera accessories and items of darkroom equipment. The Veigel-Exact enlarger, covering all-sized films from 35 mm. to $2\frac{1}{4}$ x $3\frac{1}{4}$, had a novel feature in its coupled range finder used for focusing. Voigtlaender & Son introduced its new Ultron f/2 six-element lens, which used new kinds of glass and was based on an entirely new computation. There was also the new Voigtlaender Ultragon lens for the Prominent camera with a focal length of 24 mm. and an angle of view of 95°.

Flash Photography.—Great strides were made during the year in the use of flash lamps and the electronic repeating flash equipment. This was particularly noticeable in Europe, where the use of flash lamps formerly had been almost unknown in the field of amateur photography. Many of the new cameras shown at the Cologne fair had built-in flash synchronizers. The new Compur-Synchro and Prontor-S shutters had two synchronizer settings for use with the 20-millisecond delay flash lamps and the 5-millisecond delay electronic flash tubes. The new Contax and Leica cameras were equipped with built-in synchronizers. The German Osram company was making flash lamps in various sizes with the bayonet and standard screw bases. This firm also made most of the electronic flash tubes for the new German electronic flash equipment in the portable and studio sizes.

In the United States the most spectacular increase in the use of flash lamps was shown in a survey conducted by Sylvania Electric Products, Inc. In 1937 only 6,568,000 flash lamps were sold. By 1940 this figure rose to 17,963,000. Photographers used 36,447,000 flash lamps in 1945, 78,230,000 in 1947, 155,825,000 in 1949, 232,806,000 in 1950 and more than 400,000,000 in 1951.

An important advance in flash photography was the introduction of the battery-capacitor flash in small compact form by the Kalart company at the beginning of 1951. This firm had originated the B-C system in 1935, but at that time the equipment was too bulky for general use because of the larger batteries. With the invention by the National Carbon company of the tiny Mini-Max batteries for hearing aids and other uses and the miniature capacitor for portable radios, it became possible to produce a miniature power pack for flash-lamp firing.

In the B-C system, energy from the battery is collected and stored by the capacitor until the instant of firing—then is released in a strong rapid surge. The usual battery systems consist of one or more $1\frac{1}{2}$-v. dry cells, while the B-C system uses the miniature $22\frac{1}{2}$-v. battery which builds up a powerful charge in the capacitor before each flash firing. This extra power assures positive firing of all lamps up to the limit of the unit, which is as much as six or seven flash lamps on extensions. The operation is not seriously affected by weak batteries or temperature changes.

The Eastman Kodak company announced the Kodak Ektalux Flasholder and system of flash photography, using the B-C system, in Oct. 1951. This flasholder is a high-energy, battery-capacitor unit with great flexibility and functional design. A single battery is sufficient for use with up to two extensions or three flash lamps, including one on the camera. Two batteries provide 45 v. and the Ektalux condensers can provide positive synchronization of as many as seven flash lamps strung over 120 ft. of two-wire cord, or a total of 240-ft. of wire.

Photographers using the former two-cell flasholder could now convert to the new B-C system by replacing the $1\frac{1}{2}$-v. dry cells with the new Kodak B-C Flashpack, also brought out in October. The unit consists of a 200-microfarad condenser and resistor and uses a $22\frac{1}{2}$-v. miniature battery.

Photographic Papers.—A number of new photographic papers were announced during 1951, including Kodak Medalist paper, Kodak Ektalure paper, Kodak Mural paper and Kodagraph Repro-Negative paper. The Kodak Medalist paper is well suited for use by illustrators, commercial and portrait photographers, salon photographers and photofinishers who wish to offer de luxe prints. The paper has a new-type exposure and development latitude. By varying the ratio of time allotted to exposure and development, the contrast can be sharply changed in the finished print. The speed of all four contrast grades is essentially the same.

Kodak Ektalure paper is intended for use by portrait photographers, and is available in only one surface. This cream white paper has fine grain, lustre and a speed twice as fast as that usually associated with fine projection papers. Kodak Mural paper is a hardy photographic paper that can be folded or creased without damage when large sheets are processed. It has good toning characteristics. Kodagraph Repro-Negative paper produces black-on-white photographic intermediates directly from blue-prints and other negative originals without the need for dark-room handling or special reproduction equipment, in ordinary room light, and processed with standard photographic chemicals.

Ansco Indiatone Brilliant was added to the Ansco line of fine photographic papers. This paper has a high embossed surface sheen that adds sparkle to photographic prints.

The photo products department of E. I. du Pont de Nemours & Co. introduced High Speed Varigam variable-contrast photographic paper—a faster projection paper designed especially for professional photographers. It is two to three times faster than the company's regular Varigam paper. A wide range of contrast is achieved through the use of special filters, the same as those used with the standard Varigam. High Speed Varigam became available in eight different variations of single- and double-weight paper ranging from smooth glossy to textured lustre surfaces.

During the year du Pont also introduced three new surfaces of Warmtone, a fast enlarging paper that gives a warm brown image in standard developers. These new surfaces, all in double-weight paper, were: QL, cream superrough lustre; BT, white semigloss; and B, white semimat. QL is especially suited for strong character portraiture and salon prints. BT and B are suitable for commercial and illustrative photography because of their smooth texture combined with white colour.

Film.—Ansco produced Type 843 Ansco Color Negative Camera film for 35-mm. motion-picture or slide film colour negative originals. The three emulsion layers of this film contain colour couplers which, in development, produce dye image colours complementary to the exposure colours. Other colour films by Ansco were Type 846 Ansco Color Duplicating Negative film for making colour duplicate negatives from Type 843 originals, and Type 848 Ansco Color Positive Printing film used to manufacture release prints.

"THE THREAD MAKER," photographed at Deleitosa, Spain, in 1951 by W. Eugene Smith of *Life* magazine. Shooting pictures for a photographic essay on the tiny village, Smith found that the ways of the community had changed very little since the middle ages

The Polaroid corporation demonstrated a new film with an ASA index of 3,000 compared with the usual high-speed films with a daylight ASA rating of 200 and 250. The exposed image is made on the top layer of the sensitive silver halide grains of the film. The silver deposited to make the finished print in the Land Polaroid process has a much higher covering power than the form of silver that creates the image of the conventional photographic print. The speed of this new emulsion was demonstrated by using a new Model 110 Polaroid camera and photographing the audience at the American Physical society meeting in Chicago. Thirty seconds after the exposure the finished picture was removed from the camera and projected onto a 30-ft. screen.

New Cameras.—The Eastman Kodak company introduced the Kodak Signet 35 with Synchro 300 shutter in the intermediate-price class; the new Kodak Retina IIa with Synchro Compur shutter and speeds to 1/500 sec.; and the Brownie Movie camera in the low-price field. Kodak's Tourist camera line was improved by adding new view finders, and the Kodak Tourist II included a flash synchronized shutter operating up to 1/200 sec.

A modified Kodak High Speed camera was designed to record the mechanical and electrical aspects of a subject simultaneously on the same 16-mm. motion-picture film. A second lens was mounted on the camera to record the images on the tube of a cathode-ray oscillograph through the back of the film, while the main subject is being photographed on the front. This record permitted the photographer to present a complete picture of the behaviour of electro-mechanical devices, and allowed easy correlation with strain, acceleration, vibration and other signals fed to the oscillograph in many nonelectrical problems. A 16-mm. Kodascope Pageant sound projector was also developed by Kodak.

Ansco introduced five new cameras made by the Agfa camera works in the U.S. zone of Germany. These cameras were to be known in the United States as the 35-mm. Ansco Karomat, $2\frac{1}{4}$ x $2\frac{1}{4}$ Ansco Speedex Special, $2\frac{1}{4}$ x $2\frac{1}{4}$ Ansco Speedex, $2\frac{1}{4}$ x $3\frac{1}{4}$ Ansco Viking f/4.5 and $2\frac{1}{4}$ x $3\frac{1}{4}$ Ansco Viking f/6.3, covering a wide price range.

The Perkin-Elmer Corp. installed a 5,000-lb. telescopic camera designed for meteor photography at the Harvard meteor station near Las Cruces, N.M. The unusual optical system permitted the camera to cover a 52° field and to record trails from even the smallest meteors.

An important focusing aid for the Automatic Rolleiflex camera was the new Kalart Focuspot, permitting critical focusing in dim light. When a switch is pressed on the Kalart Focuspot twin circles of light are projected from the attachment onto the subject to be photographed. The camera focusing knob is turned until the circles merge, and at this point the subject is in focus. The focusing beams can be projected more than 30 ft. A Rolleiflex shutter with built-in flash synchronizer permitting speeds from 1/50 to 1/500 sec. was announced.

Graflex, Inc., brought out the Polaroid Land back as an accessory for use with the 4 x 5 Crown or Speed Graphic cameras with Graflok backs. This attachment uses the Polaroid Land camera back in combination with the more versatile features of the Speed Graphic camera. Prints can be finished one minute after exposure.

The Zoomar corporation produced a 40-in. Reflectar lens for use on motion-picture and 35-mm. cameras for telescopic photography. Because of the high resolving power of this lens it is possible to obtain negatives of excellent detail. An 80-in. Reflectar lens was also made to cover a maximum frame of $2\frac{1}{4}$ x $3\frac{1}{4}$ in.

Other Developments.—At the 1951 convention of the Photographic Society of America in Detroit, Mich., in October, the U.S. air force demonstrated a new technique in aerial photography whereby a flash picture was taken in mid-air and transmitted simultaneously to a ground network of tele-photo stations connected by conventional telephone lines. Subjects covered ranged from industrial photography and television camera coverage through crime photography. The technical division scheduled 17 papers on varied topics—high-speed movies, exposure meters and exposure determination, mirror lenses, electronic and battery-capacitor flash circuits, tone reproduction and navy photography.

The Sylvania survey (*see* above) showed that 70% of all households in the U.S. owned a camera, as compared with 75% owning bathtubs, 63% telephones and 70% automobiles. Other figures showed that 61.4% of these households, with annual income under $2,000, either owned or borrowed a camera in 1950. From this survey it was estimated that there were close to 52,000,000 cameras in these homes.

Colour photography was steadily increasing to the point that the camera-owning public was using colour film about 20% of the time. Nearly 33% used flash lamps for every picture. (*See* also MOTION PICTURES; MUNITIONS OF WAR; NEWSPAPERS AND MAGAZINES; TELEVISION; X-RAY AND RADIOLOGY.)

Physics.

Positronium.—The existence of an atom consisting of a positron nucleus and a single electron was demonstrated by Martin Deutsch of the Massachusetts Institute of Technology, Cambridge. Atoms normally consist of a relatively massive, positively charged nucleus, surrounded by sufficient negatively charged electrons to give an over-all electrically neutral atom. The positron is a light particle, of the same mass as an electron and with a charge equal in magnitude but opposite in sign to that of an electron. Positrons are usually annihilated almost immediately after being formed; the annihilation process consists of combination with one of the electrons that are abundantly present in matter, both electron and positron literally disappearing in a burst of electromagnetic energy. J. Pirenne, A. E. Ruark and J. A. Wheeler had suggested, in 1944, 1945 and 1946 respectively, that the positron and electron might momentarily exist as an "atom" before their combination and annihilation, each circling about the other much as electrons move about the nucleus of a proper atom. Deutsch was able to show that in some instances such a "positronium" atom does exist before annihilation occurs. Further, his electronic counting methods enabled him to measure the lifetime of these atoms. The time that he found, a little over one ten-millionth of a second, agreed with the value that had been calculated in 1949 by A. Ore and J. L. Powell. J. A. Rich, working at Yale university, showed that the positronium atom of this lifetime disintegrates by forming three photons of radiation, in contrast to the two-photon disintegration of electron and positron pairs that have an even briefer conjugate existence. Rich's results were as expected from theoretical considerations.

Cosmic rays; V-particles.—A new, short-lived elementary particle was observed in cosmic rays. On two occasions in 1947, G. D. Rochester and C. C. Butler of the University of Manchester, Eng., had observed forked tracks in cloud chamber cosmic ray photographs which they tentatively ascribed to the disintegration of a kind of particle previously unobserved. During 1951 extensive additional observations of these particles were reported by the Manchester group, and confirming evidence was also published by workers at the California Institute of Technology, Pasadena, at Indiana university, Bloomington, and at the University of Melbourne, Austr. Because of the V-shaped photographic tracks by which these particles were detected, they were commonly referred to as V-particles. Although there was some evidence that indicated the existence of charged V-particles, the photographs suggested that the particle usually exists as a neutral particle. The most striking feature of the V-particle was its mass. It had been believed that the proton and neutron, with masses of about 1,840 electron masses, and the pi meson, with a mass about 275 times that of an electron, were the heaviest elementary particles. But one kind of neurtal V-particle was fairly definitely found to have a mass greater than that of the proton or neutron; specifically, a mass of about 2,200 electron masses was indicated. A second variety of neutral V-particle, with a mass of about 800 electron masses, was clearly distinguished from the first. The lifetime of the particles was estimated to be 10^{-10} sec., and they apparently decay into a proton and a negative meson, or into a pair of oppositely charged mesons. It is these decay products, and not the particle itself, which give the characteristic V-track. Physicists felt that obviously much was yet to be learned about V-particles, but they added two kinds of neutral V-particle, and, somewhat tentatively, the charged V-particle, to their puzzling list of nature's elementary particles.

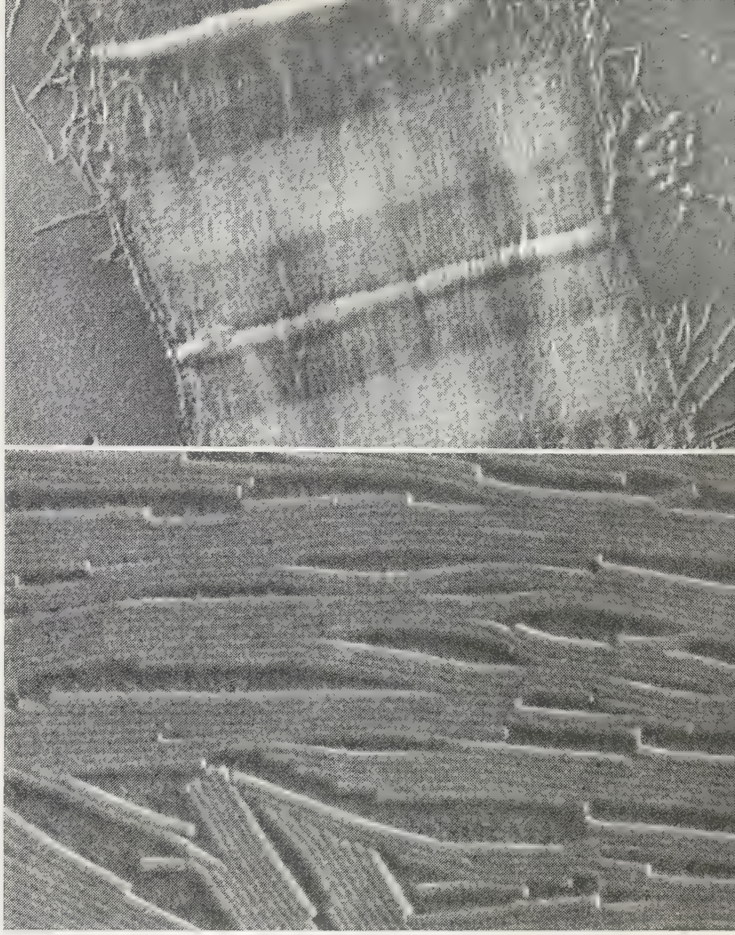
The cosmic ray primary particles are the high-energy particles which strike the earth's atmosphere from outer space and then by interaction with the atmosphere give rise to a variety of other particles and radiations. Scientific opinion formerly held that these primaries were probably protons. Additional and unmistakable evidence of other kinds of primary particles accumulated during 1951. The proton is the atomic nucleus of atomic number 1; nuclei with atomic numbers as high as 50 were found to be present in the primary radiation. In general, however, the quantity of nuclei with a given atomic number was found to decrease with increase in atomic number.

Fundamental Theory.—Theoretical physicists continued in 1951 to search for the physical theory that would explain the existence of the forces which hold protons and neutrons together into atomic nuclei. More generally, they looked for a principle that would explain why we find the elementary particles which we do find, and not those of some different mass or charge, and for the theory that would allow accurate calculation of the interaction effects between all kinds of elementary particles. Some degree of success seemed to have been achieved with respect to calculating interactions with the electromagnetic field on the elementary particle level, particularly by F. J. Dyson in England and R. P. Feynman and J. Schwinger in the U.S. But the opinion grew that quantum theory, which had been so successful and adequate in atomic physics, needed some fundamental revision before it would adequately serve as a theory of elementary particle physics.

At a symposium on "Physics Today" held in October at Chicago, Ill., as part of the 20th anniversary celebration of the American Institute of Physics, Enrico Fermi considered the problem of understanding how elementary particles combine to form nuclei and spoke of the inadequacies in existing theory. He was less optimistic than some about the difficulties being resolved by a brilliant stroke of theory; rather, he said, scientists should be prepared for a "long, hard pull" of patient experimental work before there would be sufficient data to guide an extension of fundamental theory.

Nuclear Physics.—A uranium nuclear pile, utilizing heavy water as a moderator, was put into operation in Norway. The reactor or pile (both terms seemed to be in accepted usage) was constructed jointly by the Norwegian and Netherlands governments, and gave the world another facility for the production of radioactive isotopes and for the investigation of problems in neutron and atomic energy physics. Reactors already in operation were located in the United States, Canada, England, France, and, in all probability, the U.S.S.R.

Measurements of the radioactive decay of the neutron were obtained by J. M. Robson at the Chalk River, Can., atomic energy laboratories. The fact that the free neutron is unstable and decays spontaneously into a proton and an electron had been definitely established by A. H. Snell and co-workers at Oak Ridge, Tenn., and by Robson. The latter's new measurements gave the best value so far available for the time required for the disintegration. He worked with a beam of neutrons that was directed outward from the Chalk River pile. Magnetic fields were arranged such that any positively charged protons that appeared in the beam would be deflected to one side while electrons would be carried in an opposite direction. Appropriate detectors for protons and electrons indicated the quantity of charged particles being deflected out of the neutron beam. With knowledge of the intensity of neutrons in the beam, an estimate of the rate at which neutrons were decaying could then be made. Robson's figure for the half life (the time in which one-half of the neutrons in a given sample would decay) was 12.8 min., with a probable error of plus or minus 2.5 min.



MOLECULES of muscle tissue (top) and a plant virus (bottom), some of the first pictures available in 1951 to show molecular shapes and surface contours. They were taken at the Massachusetts Institute of Technology, Cambridge, Mass., by a technique called "metal shadowing"

There was a continued increase in the use of radioactive materials in a wide variety of scientific, medical and industrial activities. The detection of radioactive atoms had for many years been accomplished chiefly by means of Geiger counters, but a different kind of detector, the so-called scintillation counter, was beginning to be used extensively in 1951. Geiger counters detect an energetic particle, emitted from a radioactive atom, by means of the high electric potential that is maintained across the counter tube; an energetic particle passing through the tube creates a trail of ions which, under the influence of the high potential, form a momentary discharge of current across the tube, thereby giving a signal that indicates the particle to have passed through the tube. The scintillation counter operates in an altogether different manner. The incident rays or particles, on striking a detector material, give rise to photons—that is, to light "scintillations"—which in turn strike a photocell surface and cause electrons to be emitted from the surface. These electrons constitute a small current which can be amplified in the conventional manner and carried to a convenient signal device. Scintillation counters were not expected to supplant generally the traditional Geiger counters, but they were obviously superior to the latter for the detection of the energetic gamma or X-rays emitted by some radioactive materials. A scintillation counter with an anthracene detector crystal, developed for clinical detection of radioactive iodine by its gamma radiation, was reported as detecting 18% of the gamma rays incident upon it, as compared with 2% efficiency with a Geiger counter. R. Hofstadter and his group at Stanford university, Calif., constructed a counter with a sodium iodide crystal detector for which they reported very close to 100% efficiency for the detection of X-ray photons of energies ranging from 5,000 to 80,000 ev.

The small amounts of natural radioactive carbon which are formed as a result of cosmic ray bombardment of the atmosphere had been successfully used in various kinds of archaeological and geological date determinations; a living organism, for example, ceases to maintain a steady equilibrium with the radioactive carbon in atmospheric carbon dioxide after its death, and the amount of radioactive carbon in the organism at a given time after death is a measure of the time elapsed since death. W. F. Libby and E. C. Anderson of the University of Chicago reported on a survey of the amount of radioactive carbon found in recently living biological materials collected from all parts of the world. Since cosmic ray intensities vary over the surface of the earth it might have been expected that radiocarbon concentrations would vary in different areas. Libby and Anderson found, however, that world-wide mixing is sufficiently complete that no significant concentration differences appear. Their results also appeared to give some indication that there had been no significant change in cosmic ray intensity for several thousand years.

Mass and Microwave Spectroscopy.—The accurate determination of the masses of the various atomic species has been a keystone of modern physics. Atomic mass measurements with a new kind of instrument were announced by S. A. Goudsmit, E. E. Hays and P. I. Richards of the Brookhaven National laboratory, Long Island, N.Y. The various mass spectrometers used previously depended on a spatial separation of ions of different masses or charges from a beam of moving ions, the separation resulting from properly applied electrical and magnetic fields. The Goudsmit instrument utilizes the differences in time of flight over a given path which would appear among atomic ions of different masses. The ions travel a set vertical path between source and detector but, also, a uniform magnetic field causes them to move in circles as they descend, so that their actual paths are helical in form. By the well-known cyclotron principle the time per revolution in a magnetic field is independent of the ion velocity. The ion detector, at the end of the path, records the arrival of an ion after it has travelled through a certain number of total revolutions. Because of varying initial velocity directions, a group or "pulse" of ions sent out from the source travel the path to the detector with varying numbers of total revolutions; but for any given number of revolutions, ions of different masses will reach the detector at somewhat different times, since the time for a given number of revolutions does depend on the mass of the ion. The time between impulses given to the detector by different ions may therefore be converted into a determination of mass differences between the ions being received. In contrast with traditional mass spectrometers, this new instrument had the promising feature that its accuracy does not decrease when masses of ions of heavy atoms, high in the periodic table, are being measured.

The study of microwave spectra, which was so fruitfully developed from World War II radar work, continued in many laboratories. Molecular spectra in the region between that of far infra-red and short-wave radio wave lengths could no longer be considered to be altogether unknown. In some instances knowledge of microwave spectra gave new information about the structure of the materials studied. A typical result was that reported by R. Hughes from his study of the microwave spectrum of ozone. The ozone molecule is constituted by three oxygen atoms, arranged in the form of an isosceles triangle. Previous work, by electron diffraction methods, had indicated a distance between the atoms on the two equal sides of 1.28 hundred-millionths of a centimetre. The microwave study confirmed this length, and also led to a value of 117° for the apex angle of the molecule. (*See* also ELECTRONICS; STANDARDS, NATIONAL BUREAU OF.)

BIBLIOGRAPHY.—Authoritative popular accounts of current physics appear in *Endeavour* (London), *Scientific American* and *Physics Today*. The accounts in *Nature* (London) and the *Physical Review* provide a good beginning for reading on current physics research in the technical journals.

Physiology.

Fibrillation of the Heart.—The ventricles of the heart pump blood by the co-ordinated contraction of their muscle fibres and fill during the period when these fibres relax. In ventricular fibrillation this co-ordinated contraction and relaxation is lost. The ventricles appear as a twitching, writhing mass, producing no useful beats. The pulse disappears, the arterial blood pressure falls abruptly and death occurs in six or eight minutes from lack of blood supply to the brain and spinal cord. Spontaneous recovery is rare in man or larger animals when the condition has persisted for more than a minute or two.

It had been known since 1899 that small amounts of electric current passing through the heart may cause it to fibrillate and that a much stronger current can stop the fibrillatory process. In 1933 a practical apparatus for electrical defibrillation of the hearts of laboratory animals was constructed. In Nov. 1951 W. B. Kouwenhoven and J. H. Kay described such an apparatus for man. Ordinary house current, 60 cycles, 110 or 120 v., can be used. The voltage is ordinarily stepped up by a variable voltage transformer to 130 v. The equipment is simple, rugged, with features for safety in handling and ease of sterilization of the electrodes.

Artificial respiration is given, preferably oxygen supplied by a breathing machine, and the heart is exposed. The surgeon rhythmically squeezes the heart with his hand, thus propelling blood to the brain and to the heart itself through its own arteries. The heart becomes more responsive to the defibrillating current under these conditions. The flat electrodes are placed one on each side of the heart and the shocking current is applied for a fraction of a second, repeating at brief intervals if necessary. Procaine injected into the ventricular cavity has been used to facilitate defibrillation. When the heart resumes beating, its contractions may be strong or weak. In the latter case cardiac massage and epinephrine hydrochloride or calcium chloride solutions may be administered.

Kouwenhoven and Kay reported on two patients who developed ventricular fibrillation during surgery and were successfully defibrillated by the electric current. Both recovered completely although cardiac arrest had been present for 15 min. in one case and 5 min. in the other. A number of patients had been defibrillated previously, including one who had no heart beat for a period of one hour and ten minutes. During this period artificial respiration and cardiac massage were employed, for the brain is severely damaged if deprived of its blood supply for more than a few minutes.

Research in 1951 added to knowledge of the electrical resistance of the heart, the amperages required for fibrillation and defibrillation and the practicality of electrical defibrillation through the intact chest of an anaesthetized animal. For the latter large electrodes and a higher voltage are recommended. One animal was defibrillated 130 times through the intact chest but the therapy was started within a minute after the onset of fibrillation. Prompt recognition of ventricular fibrillation is possible by taking electrocardiograms. When defibrillation is delayed, the heart may fail to start beating spontaneously or contract so feebly that cardiac massage through the opened chest is necessary to maintain an adequate circulation until the heart contracts effectively.

Localization of a "Feeding Centre" in the Brain.—It is possible to place electrodes accurately in a desired portion of the brain of an anaesthetized animal such as the rat. An electric current can be passed between the two closely approximated points of the electrode and produce a limited destructive lesion by heat coagulation. Such a lesion placed in the ventromedial nucleus of the hypothalamus (located just above the floor of the skull) results in the animal becoming obese. After operation the animals show a permanent increase in food intake termed "hyperphagia." Apparently a "centre" has been destroyed which restrains food intake, so that abnormal hunger develops.

In 1951 Bal K. Anand and John R. Brobeck reported that they had produced small electrolytic lesions in the lateral hypothalamus and found that food intake was inhibited to the point of starvation. The lesions producing this effect must be bilateral or the animal will continue to eat normally. If the rat is made hyperphagic and obese by the first described operation, then a small destructive lesion on each side in the lateral hypothalamus at once causes the animal to refuse all food. Thus the hypothalamus seems to contain two centres, one promoting food intake, the other limiting it.

Blood of Cyclotron Workers.—In 1949 M. Ingram and S.

W. Barnes had reported the occurrence in the blood of cyclotron workers of lymphocytes with a double or bilobed nucleus instead of the normal single nucleus. The workers had only been exposed to small amounts of radiation believed to be safely tolerated. In 1951 Ingram and Barnes reported the experimental production of the same phenomena in dogs from relatively slight exposures, probably below the currently accepted tolerance levels. The greatest number of such cells occurred during a two week period following the exposure and thereafter gradually lessened. The number of bilobed lymphocytes was apparently small for most blood smears were negative even in the weeks of maximum response. It was not known what component of the radiation was responsible. The condition seemed to be less prominent in persons working with the 26-in. cyclotron and with radioactive isotopes than it was in personnel associated with the 130-in. cyclotron.

Physiological Adaptation to Cold.—Laurence Irving reported on the physiological mechanisms involved in adaptation to a cold environment. Lower body temperature is not essential; Irving found, for example, that arctic reindeer and dogs near Barrow, Alsk., had a body temperature characteristic of warm-blooded animals although the environmental temperature was below −45° C. (−49° F.) at the time. Nor is their metabolic cost of living increased; it is similar to the basal level of energy expenditure found in warmer climates.

Insulation is a factor of great importance. The animals' fur or feathers or, in the case of seals, a layer of blubber under the skin, may provide effective insulation. The insulative properties of various furs vary with the thickness of the fur, increasing in the winter time.

The fur of a lemming when fluffed up provides twice as much insulation as the fur with the hairs smoothed down. Air is a poor conductor of heat and erect hair or feathers traps more air. Among arctic animals the fur thickness increases with the size of the animal up to that of the arctic white fox. There is no marked increase in larger animals but a decrease in smaller arctic animals. Presumably a thick fur would interfere with the free movements of the small animals. These animals cannot endure the cold weather continuously but in the coldest season seek protection such as well insulated nests.

Larger arctic animals such as white foxes, Eskimo dogs and arctic sea gulls showed no increase in heat production when exposed to temperatures as low as −30° C. (−22° F.). The range to which they could adapt without change in heat production was from 30° C. to −30° C., a total of 60° C. (108° F.). The range for the smaller arctic animals is considerably less and for tropical animals often only 10° C. (18° F.).

Unclothed man reacts like the more temperature-sensitive tropical animals. Eskimos appear to be as temperature sensitive as white men and wear equally warm clothing. By the use of suitable clothing man can span the whole temperature range from the tropics to the arctic. He is a tropical animal carrying his tropical climate with him. A man becomes uncomfortably cold if he tries to spend a night at −40° C. (−40° F.) in one layer of arctic fur clothing or naked in a one-layer arctic fur sleeping bag. He needs more insulation than the animals whose fur he is using. The arctic mammal sleeps in a more curled-up position, exposing less surface for cooling. Arctic animals may tolerate a low leg temperature, thus reducing heat loss from the extremities. Usually the fur clothing and sleeping bags are made from the lighter autumn furs.

Pittsburgh. The 1950 U.S. census fixed Pittsburgh's population at 676,806, 12th in the nation, and that of Allegheny county as 1,515,237. The Pittsburgh metropolitan district numbered 2,213,236. Mayor of the city in 1951 was David L. Lawrence.

In 1951 the Pittsburgh district experienced marked commercial and industrial gains. Business activity (production, trade and shipments combined, with December estimated from weekly data) was 194.2% of the 1935–39 average and 6.5% higher than in 1950. Industrial production, similarly calculated, was 198.2% of the 1935–39 average, 7.5% higher than the previous year, according to the University of Pittsburgh's bureau of business research. Average weekly rate of steel operations was 99.1% of capacity as compared with 97.2% in 1950. Bituminous coal production in Pennsylvania for the first 11 months of the year was 6% higher. Department store sales for the year were up 7.3%. Pay rolls of all firms for 11 months were 17.2% higher than in the same period of 1950, while numbers employed increased by 6.7%.

Ground was broken for two multistory garages, first in a comprehensive program of the Pittsburgh Parking authority. Demolition was nearly completed by the Pittsburgh Redevelopment authority on the 13-ac. site for a memorial park and traffic interchange at the confluence of the Monongahela and Allegheny rivers. On an adjoining 26-ac. tract, assembled by the authority, construction was far advanced on three major office buildings. On the south side of the Monongahela river the first heat was tapped from 1 of 11 new open-hearth furnaces, part of a $100,000,000 Jones and Laughlin Steel corporation expansion program on land made available through the authority.

Carnegie Institute of Technology put into operation a $2,500,000 nuclear research centre, the central feature of which was a 400,000,000-ev synchrocyclotron capable of producing mesons.

Under a new redistricting act, voted by the Pennsylvania legislature pursuant to congressional reapportionment, Allegheny county was alloted four seats in the U.S. house of representatives, instead of five as formerly.

Taxable real estate for 1951 in Pittsburgh was $1,028,813,256; in Allegheny county, $2,330,000,000. (C. F. Ls.)

Pius XII (1876–), the 262nd successor of St. Peter in the see of Rome, was elected by the cardinals in conclave on his 63rd birthday, March 2, 1939, and was crowned pope on March 12, 1939. (See *Encyclopædia Britannica.*)

At the traditional New Year's reception for the diplomatic corps in 1951 the pope spoke of the horror of war and the desire of "an equitable, freely stipulated peace, immune from all unjust conditions and from all the intolerable burdens" imposed on the peoples of the world.

World government was to be considered as a means to establish peace according to a speech to delegates from 22 countries attending the fourth annual congress of the World Federal Government movement in Rome. World government was in keeping with the traditional objectives of Roman Catholic doctrine, which strives for peace, the pope said.

In an encyclical letter, *Evangelii Praecones,* his holiness praised missionary progress of the preceding 25 years. He reported that Catholics in mission lands had nearly doubled, the number of Catholic missions had increased from 400 to 600 and the number of native and foreign priests from 14,800 to more than 26,800.

Addressing the international Catholic Congress on Rural Problems, Pope Pius said it must be recognized that industrial capitalism had stimulated agricultural production and had raised the physical and spiritual level of the country people in many parts of the world. Therefore, criticism should not be directed against the capitalist system as such, but against the dangers that would arise if its influence were to alter the specific character of rural life and make the country a mere extension or annex of the city.

The pope's thoughts on socialized medicine were expressed in a letter by Msgr. Giovanni Battista Montini, substitute secretary of state, addressed to Charles Flory, president of the Semaine Sociale, a French Catholic organization. The letter made it clear the Vatican opposed any system of socialized medicine that conflicted with the "moral principles of respect for man and family." With appropriate safeguards against certain medical practices, socialized medicine does not conflict with the principles of the Roman Catholic Church, which welcomes any state initiative in the field.

Pope Pius XII commemorated the 15th centenary of the Council of Chalcedon in the encyclical, *Sempiternus Rex.* As a means of imploring divine intervention for peace the pope, in the encyclical *Ingruentium Malorum,* urged all Catholics to recite the rosary.

In a letter to the archbishops, bishops, clergymen, and laity of Czechoslovakia, Pope Pius denounced the Communist regime of that nation for its religious persecution and accused the Prague government of carrying on a campaign based on falsehoods. In March a decree of excommunication was issued against all Catholics who supported the Czech government's efforts to bring about schism.

Plastics Industry.

During 1951 the plastics industry in the U.S. went counter to past seasonal trends in that during the first half of the year a far greater volume was produced than during the last half. Comparative figures for 1950 and 1951 are given in Table I.

Machines for Thermoplastics.—Machinery manufacturers reported the sale and delivery in the U.S. of 568 injection machines in 1951; shipments to other countries totalled 165.

Table I.—*Production and Sales of Synthetic Resins and Cellulosics Used in Plastic*[*]

(In pounds)

	1951	1950
Cellulose plastics (all)[†‡‖]	116,600,000	127,500,000
Phenolic and other tar acid resins[†§‖]	393,000,000	372,200,000
Urea and melamine[§‖]	181,000,000	185,100,000
Styrene and styrene-derivative polymer and copolymer resins[†‖]	305,000,000	332,000,000
Vinyl resins[‖¶]	500,000,000	402,000,000
Miscellaneous[♀]	322,000,000	263,000,000
Total	1,817,600,000	1,681,800,000

[*] Source: U.S. Tariff Commission for all except estimates for last four months of 1951.
[†] Includes fillers, plasticizers and extenders.
[‡] Includes sheets, rods, tubes, moulding and extrusion materials, primarily ethyl cellulose and Valite.
[§] All dry resin except moulding material which includes filler.
[‖] Excludes data on protective coatings.
[¶] Tariff Commission figures included filler for film and sheet every year except 1951. For comparative purposes in this table an estimated figure for filler was added to the 1951 figure for film and sheet in order to show trends.
[♀] Includes acrylic, polyethylene, nylon and other resinous moulding materials; petroleum resins and coumarone indene.

Table II.—*Estimated Number of Machines in the U.S. Thermoplastic Moulding and Extrusion Industry*

	1951	1950	1949	1944
Injection[*]	5,035	4,654	3,966	1,400
Extrusion[†]	2,660	2,205	1,987	—

[*] Exclusive of machines under three-ounce capacity.
[†] Does not include one-inch bench extruders or machines with bore larger than six inches.

There was a trend in the injection moulding field toward the modification of machines to increase their capacity by adding preplasticizing equipment and larger heating chambers. By this means, for example, a machine that could formerly consume 60 lb. of material per hour might be made to consume 90 lb. per hour.

Producers of extrusion machines for plastics delivered approximately 455 machines in 1951 in the U.S.; about 150 machines were exported. Table II gives statistics on machines for processing thermoplastics for 1944, 1949, 1950 and 1951.

Cellulosics.—The monthly production of acetate and butyrate ran at a peak of 8,600,000 lb. in Oct. 1950, but never exceeded 6,700,000 lb. after Jan. 1951. The brightest spot in the cellulosic plastics industry in 1951 was the progress made in the production and sale of dry-extruded thin film less than 3 gauge thick.

Butyrate moved along in just about a parallel line with acetate insofar as sales were concerned. From June 1950 to June 1951 sales were large, but there was a decline in the last half of 1951. The principal finished products were in the following fields, in this order: automotive, communications, pipe, agricultural (irrigation tubing) and hardware.

Phenolics.—During 1951 the National Production authority was almost continuously under pressure to issue certificates of necessity for chemical firms which wanted to expand or build phenol plants. The amount of phenol consumed in 1951 was estimated at from 365,000,000 lb. to 370,000,000 lb. as against 312,000,000 lb. in 1950.

Almost two-thirds of phenol production was used in phenol-formaldehyde resins. It was expected that the percentage used by phenolics would increase as the supply became greater.

In the first six months of 1951, sales of phenolic moulding powder were running from 17,500,000 lb. to more than 19,000,000 lb. monthly, but declined to from 16,000,000 lb. to 17,000,000 lb. in the last six months.

High Pressure Laminates.—Phenolic type resin consumption by high pressure laminates was about the same in both 1950 and 1951. The high month was March 1951, when 8,000,000 lb. were used; in the last six months the figure dropped to about 5,000,000 lb. a month.

In addition to phenolic laminates, about 25,000,000 lb. of melamine laminates were produced in 1951, according to one manufacturer.

The decline during the last half of the year was caused by a drop in the demand for decorative laminates and for industrial laminates for television and radio production, the decline in the latter having started early in 1951.

Polystyrene.—After Feb. 1951, sales of polystyrene varied from 20,000,000 lb. to 24,000,000 lb., with August the highest month. Wall tile consumption increased in 1951 to approximately 25,000,000 lb. in comparison with 10,000,000 lb. in 1950. Easily moulded items, like flower pots, were produced in such quantities that they soon saturated the market.

The high-styrene butadiene compounds, used mostly for shoe soles and in floor coverings, would probably have been produced in much larger quantities in 1951 if more styrene monomer had been available. As it was, leather was reported to have only 42% of the shoe sole market in comparison with 78% in 1942.

Other uses for styrene include the polyester resins. The total production of polyesters during 1951 was between 12,000,000 lb. and 15,000,000 lb.; the expected military orders did not materialize. Leading civilian applications were corrugated structural sheets and pipe.

Urea and Melamine.—Resin sales of urea and melamine exceeded those of 1950 in every category except adhesives. Adhesives production started to decline in May because of the slump in the hardwood plywood furniture fields where urea adhesives are extensively used.

The use of urea and melamine for textile treatment to impart permanent glaze, shrinkproofing, antiwrinkle properties and the like, plus their use in paper treatment for such things as sizing, waterproofing V-board, strengthening wet-strength paper, etc., made good progress in 1951. Their growing use in textile treatment was not as rapid as expected, but was regarded as promising.

Another upward trend was in asbestos-filled melamine, starting about February. Most of it was for government rated orders in such things as aircraft connectors and magnetos.

The melamine and urea moulding powder capacity was estimated at 80,000,000 lb., and it was believed that this might be increased by 20% or 30% with a few alterations and adoption of new techniques. Closures, wiring devices and buttons were still the leading applications for urea.

The Vinyls.—Consumption of vinyl resins of all types was estimated at more than 400,000,000 lb. in 1951. If the plasticizers and fillers were included, the vinyls were unquestionably the largest volume category in plastics. These materials include vinyl chloride and copolymers; butyral; acetate; alcohol; formal; and vinylidene chloride (saran).

Although the industry sold approximately 40,000,000 lb. or 45,000,000 lb. more of resin in 1951 than in 1950, there was little fear that the market had been permanently saturated. In drapes, the biggest outlet, vinyl materials had reached only a part of their potential possibilities. From shower curtains to table covers to drapes, the industry had gone from one big volume outlet to another.

Sales of sheeting or film more than 10 gauge thick were good in 1951 despite the decline in furniture and automobile production. Most of it was in the 12- to 20-gauge range. The effect of the smaller use in furniture and automobile upholstery was somewhat offset by the use of vinyl upholstery on more types of furniture; also, the ratio of vinyl-upholstered cars was reported to have increased. The use of vinyl for luggage was 25% greater than in 1950, 91% of luggage manufacturers using some plastic sheet or coated material in their lines.

Vinyl coated fabric production registered a fair increase over 1950 but the industry was disappointed in the amount of government contract business. Plastisols took over a good portion of the coated fabric and paper field. Vinyl extrusion and moulding material moved ahead of film in volume consumed for the first time since World War II. Wire coating accounted for most of the increase; heavy defense order business was the impelling force behind demand. In moulding material, the chief use was for phonograph records, which took between 20,000,000 lb. and 25,000,000 lb., despite a severe drop in the spring. Slush and dip moulding used from 8,000,000 lb. to 10,000,000 lb.

Polyethylene.—Because polyethylene, acrylic and nylon are listed under miscellaneous by the tariff commission (*see* Table I), it is difficult to separate the figures. However, a good estimate was that the total capacity at the close of 1951 would be around 85,000,000 lb. a year in comparison with approximately 55,000,000 lb. when polyethylene went on allocation in June 1951.

Polyethylene was placed on allocation in 1951 because the signal corps needed great quantities for assault wire. However, there had not been enough for civilian demand even before the start of the Korean war.

Acrylic.—Production of acrylic in 1951 was estimated to be larger than during any year since World War II. Estimates of production of moulding powder alone were as high as 25,000,000 lb., with automotive parts the leading outlet.

Nylon.—Nylon plastics came into surprisingly large production in 1951 and were on allocation practically all year, but the military demand dropped and production became improved after October. The big military demand was for jacketing on assault wire. (*See* also MUNITIONS OF WAR; RAYON AND OTHER SYNTHETIC FIBRES.)

Pleven, René (1901–), French statesman, was born at Rennes, April 13. After graduating in law at the University of Paris, he chose a business career and at the outbreak of World War II was managing director of an industrial company in Great Britain. He went to the United States as deputy chairman of the French Air mission but was back in France at the time of the capitulation. He joined Gen. Charles de Gaulle in London and was sent to assist in rallying French Equatorial Africa to the Free French cause. After his return to London, he became commissioner for economy, finance and the colonies in the French National committee in Sept. 1941. He was minister of colonies in the French provisional government at Algiers (June 1943) and minister of finance in De Gaulle's first government formed in Paris (Nov. 1944); subsequently he added the portfolio of national economy to that of finance, retaining both until Jan. 1946. Pleven was a member of the first constituent assembly (Oct. 1945–May 1946) and of the national assembly (Nov. 1946–May 1951) in which he led the small group, the Union Démocratique et Socialiste de la Résistance (U.D.S.R.). He held no further ministerial office until Oct. 1949 when he became minister of national defense in the Georges Bidault government. He retained this portfolio in the second Henri Queuille government. On July 12, 1950, Pleven formed a coalition cabinet of Christian Democrats (M.R.P.), U.D.S.R., Radicals and Socialists. As a leader of a "third force" government he was fiercely attacked by the Gaullists. He resigned on Feb. 28, 1951, joined the third Queuille cabinet as vice premier and, after the election, formed on Aug. 11 his second cabinet, this time without Socialist but with some Conservative participation.

Poland. A people's republic of eastern Europe, Poland is bounded east by the U.S.S.R., south by Czechoslovakia, west by Germany and north by the Baltic sea. Area: (before Sept. 1, 1939) 150,052 sq.mi.; (after Aug. 2, 1945) 120,359 sq.mi. Pop.: (Sept. 1, 1939, est.) 35,339,000; (Dec. 3, 1950, census) 24,976,926. Language: Polish. Religion: Roman Catholic. Chief towns (pop., 1950 census): Warsaw (cap., 650,064); Łódź (619,914); Cracow (330,046); Poznań (320,294); Wrocław (289,734); Gdańsk (193,530); Szczecin (178,210); Katowice (141,277). President of the republic in 1951: Bolesław Bierut; prime minister: Józef Cyrankiewicz.

History.—During 1951 the Communist leaders sought to arouse the nation to alarm by inculcating the idea of the growing danger of an aggressive war threatened by the United States, the rearmament of Germany being the inevitable preliminary to such a war, of which Poland would be the first victim. This was the gist of a speech by Bierut at the sixth plenary session of the central committee of the Polish United Workers' (Communist) party in Warsaw in February. Nevertheless, there was a possibility of preserving peace, Poland's independence and its territorial integrity by maintaining close friendship with the Soviet Union and people's democracies and by forming a large national front and working hard to fulfil the six-year plan.

At the same time, never since 1947 had there been discovered more plots to overthrow the people's democracy, more spies in the pay of warmongers arrested or more saboteurs sentenced to death or long terms of imprisonment. Besides dismissal from the government of the last prominent non-Communists of the Lublin era the year saw also many of the Communist "old guard" awaiting trial for "nationalist deviation."

On Feb. 15 an agreement was signed in Moscow concerning an exchange of territories. The Soviet Union obtained an area of 185 sq.mi. south of Hrubieszów and east of Tomaszów Lubelski through which passed the main Kowel-Lwów railway and a local Krystynopol-Bełz-Rawa Ruska line. Poland was given in exchange an area of similar size about 20 mi. S. of Przemyśl: it included the town of Ustrzyki Dolne and was described as a valuable addition to the national economy because it would add 20% to natural crude oil production.

It was reported that in the spring the supreme headquarters of the soviet and satellite armies had been established at Jablonna, north of the capital. During the year four divisions were added to the army and by the winter it was believed to comprise 12 infantry, 4 motorized, 2 mechanized and 2 armoured divisions.

In August four generals and five other officers of the prewar army, who in 1945 had joined the new army, were tried on charges of espionage and plotting the overthrow of the people's democracy, among them being Maj. Gen. Stefan Mossor, who until 1950 had been in command of the Cracow military area. On Aug. 13 the four generals were sentenced to life imprisonment and the five other officers received sentences of from 10 to 15 years' imprisonment. The trial also aimed at compromising more important personalities. One of the accused charged Gen. Marian Spychalski, former deputy minister of national defense and chief of the political department of the ministry, with bringing prewar Polish officers into the army in order to counteract soviet influence in the forces, and the name of Władyslaw Gomułka, former deputy premier and secretary general of the Communist party, was also mentioned.

In October the *sejm* ordered Gomułka and Spychalski to be deprived of their seats and directed that judicial proceedings should be started against them for their activities against the people's Poland.

During 1950, its first year, the industrialization plan was overfulfilled by 7.4%, and according to Hilary Minc, deputy premier and chief economic planner, production was 124% higher than in 1938, although he was, in fact, comparing the industrial output of two vastly different territories. During the first half of 1951 the plan was just fulfilled, but the third quarter brought a general deficit of 2.6% and in heavy industry a deficit of 54%. Production of coal, steel, zinc, lead, oil, machine tools, railway engines, freight cars, trucks and synthetic fertilizers was lagging behind the plan. The harvest of the four basic grains was at the 1950 level, but the potato crop was bad.

After the summer of 1951 the country had been experiencing an acute food shortage. Minc explained this by the fact that while in 1931 the agricultural population constituted 61.4% of the nation, in 1950 the proportion was only 45.7%. At the same time the number of wage earners outside agriculture had risen from 2,700,000 to 5,200,000. The failure of agriculture to keep pace with the development of industry was another reason for food shortage. If the plan for 1951 were fulfilled, the industrial output would be 168% higher than in 1938, but the agricultural plan provided for only a 6% increase over the prewar figure. The reason for this weakness, according to Minc, was that Polish agriculture was still based on individual holdings. The remedy was collectivization, but the government and party were not prepared to force the pace because artificial intensification of the tempo of change-over to a collective economy would be erroneous and harmful. His conclusion was that disproportion between the rate of industrial and agricultural progress was unavoidable and would accompany economic development for a long time.

In May the *sejm* appointed a commission including the representatives of the Polish Communist party, Polish United Peasant party and Democratic party, as well as of the Catholic Social parliamentary group to prepare a draft constitution. At its first meeting in September under the chairmanship of Bierut the commission set up ten subcommittees with responsibilities for different sections of the draft, which was to be submitted to a nation-wide discussion.

It was announced on March 17 that Stanisław Skrzeszewski had superseded Zygmunt Modzelewski, foreign minister since 1947.

Pressure continued on the Roman Catholic hierarchy to assume responsibility for the appointment of bishops in the recovered territories, and by this means the Warsaw government hoped to create a schism. In January it was announced that the apostolic administrators of Gdańsk, Olsztyn, Wrocław, Opole and Gorzów Wielkopolski (Landsberg), appointed in 1945, had been relieved of their offices. Three days later were published the names of five vicars capitular to succeed them. In February Bierut discussed the stabilization of ecclesiastical authority in the recovered territories with the primate of Poland, Msgr. Stefan Wyszyński. Later in the month the Polish hierarchy notified the clergy that the primate had vested canonical jurisdiction in the priests elected by diocesan councils, who thenceforward were to exercise ecclesiastical authority in the five western provinces in accordance with canon law. By this action the primate saved the unity of the church. During a visit to Rome in April Monsignor Wyszyński saw the pope, but failed to secure endorsement of the situation by the appointment of bishops to administer the five new provinces. In July he was accused by *Pravda* of undermining the vital foundations of the people's Poland. Many Catholic priests were tried for allegedly antistate activities, and it was estimated by the Vatican that about 900 members of the clergy were in prison. (*See* also GERMANY.)

Education.—Schools: (1950–51) kindergartens 7,685, pupils 341,610; (1949–50) primary 22,417, pupils 3,242,000, teachers 76,560; (1948–49) secondary, lower grade 335, pupils 197,110, higher grade 486, pupils 140,893; secondary vocational 1,131, pupils 183,440; (1950–51) teachers' colleges 149, students 32,570; (1951–52) institutions of higher education 83, including 8 universities, students 123,500.

Finance and Banking.—Budget (1951 est.): revenue 55,972,000,000 new zlotys, expenditure 51,891,000,000 zlotys. Official exchange rates: U.S. $1=4 zlotys.

Foreign Trade.—(1949) Imports 2,530,000,000 roubles, exports 2,476,000,000 roubles.

Transport and Communications.—Railways (Jan. 1949): 21,415 km.; freight traffic (1950) 35,060,000,000 ton-km.; passenger traffic (1950) 26,309,000,000 passenger-km. Roads (April 1947) 96,605 km.; licensed motor vehicles (April 1948): cars 24,240, buses and trucks 28,957, motorcycles 24,561. Shipping (May 1949): merchant vessels 46, total tonnage 164,989 gross registered tons. Freight traffic in Polish ports (metric tons, 1950): loaded 12,456,000, unloaded 3,216,000. Sea-borne shipping, ships entered (all ports, 1950) 7,248,000 net registered tons. Air transport (1950) 39,600,000 passenger-km. Telephones (Jan. 1950) 225,000 subscribers. Radio receiving set licences (Jan. 1951) 1,475,000.

Agriculture.—Main crops (metric tons, 1950): wheat 1,990,000; rye 5,880,000; barley (1949) 1,028,000; oats 1,930,000; sugar, raw value (1951) 950,000; potatoes (1949) 30,900,000. Livestock (Dec. 1950): cattle 7,164,000; horses 2,797,000; pigs 9,928,000; sheep 2,194,000.

Industry.—Fuel and power: coal (1950) 78,000,000 metric tons; lignite (1950) 4,836,000 metric tons; electricity (1950) 9,408,000,000 kw.hr.; crude petroleum (1948) 132,000 metric tons; natural gas (1948) 160,000,000 cu.m.; manufactured gas (1948) 289,000,000 cu.m. Raw materials (metric tons): steel ingots and castings (1950) 2,520,000; zinc (1948) 120,000; lead (1948) 18,500. Manufactured goods (metric tons, 1950): cotton yarn 92,200; woven cotton fabrics 69,000; wool yarn 41,900; rayon filament yarn 10,100; cement 2,508,000.

Police.

The Committee on Police Conditions of Service (for England and Wales) appointed by the home secretary in 1948 with Lord Oaksey as chairman, continued to exercise a major influence in 1951. Improved conditions of service resulting from the 1949 and 1950 reports of that committee apparently had increased recruitment throughout Great Britain, with the result that the wide gap between authorized establishment and actual strength was being perceptibly narrowed. In some forces the ratio of police to population now equalled that which prevailed prior to World War II, though increases in the number of offenses and motorized traffic had brought corresponding burdens to police.

In the United States, District Attorney Myles MacDonald of Kings county (borough of Brooklyn, New York city) pressed his criminal charges against scores of police in connection with mounting evidence of criminal alliances between police and gamblers. Testimony of Harry Gross, convicted on gambling charges, was held vital to the successful prosecution of indicted policemen, some of whom were of high rank. Mass trial of the defendants before County Judge Samuel Leibowitz was brought to an abrupt close by the refusal of Gross to testify, although he apparently talked with considerable freedom in his numerous appearances before the Kings county grand jury. Police Commissioner George P. Monaghan thereupon ordered the defendant police to stand administrative trial before a trial (deputy) commissioner especially appointed for the purpose, and upon receiving that official's report, promptly dismissed some for their proved complicity in gambling arrangements, reduced an assistant chief inspector (second highest rank in the force) through four echelons of command to the rank of captain, and ordered drastic changes in the assignments of those whom the trial commissioner either exonerated or found inadequate evidence to establish guilty association. Whether new evidence could be developed to justify further prosecutions without reliance upon Gross seemed at best doubtful.

Emergence of Japan from close post-World War II military control found that country operating under the highly decentralized police system imposed by the military occupation. Purpose was to destroy the close antidemocratic surveillance characterizing the centralized police system of the imperial regime. Whether the advantages of both systems could be secured under the new arrangements presented one of the most interesting questions of the year.

WOMAN TRAFFIC OFFICER, part of a volunteer group of mothers patrolling school crossings in Red Bank, N.J., in 1951. The group had no police power but ensured safety control where local police were unable to guard all important crossings

The strenuous efforts of police forces in England, Wales and Scotland to recruit their numbers up to authorized strength found no counterpart in the United States, where states, provinces, cities and national governments alike found it easy to attract police applicants whenever existing vacancies offered opportunities for early employment. One reason was the continued rise of police salaries, which in general had kept abreast of wages for most skilled employment. Another stimulus to recruiting was the steady enlargement of pension systems to include more and more forces, with more liberal terms covering retirement, disability or death, and an increasing actuarial base.

Percentage of Crimes Cleared by Arrest in U.S. Cities

Uniform Crime Classification	1950	1949	1944	1939
Murder and nonnegligent manslaughter	93.8	93.7	90.8	87.4
Manslaughter by negligence	88.3	85.1	81.5	87.7
Rape	80.3	80.2	74.8	81.8
Aggravated assault	76.6	77.2	75.7	76.5
Robbery	43.5	39.5	38.7	41.9
Burglary	29.0	29.0	31.6	34.0
Larceny	22.1	21.6	23.2	25.1
Auto theft	25.6	27.3	24.4	24.4

Adoption of the 40-hour week by United States police forces also proceeded at an accelerating pace. But those who looked beyond the immediate police horizon doubted whether such multiplying influences could continue unabated, since considerations of mounting public expense might threaten either the increase in police strength, or the new scales of pay and of pensions, or again lengthen the hours of duty beyond limits generally applied by industry, commerce and government.

Also bearing upon the issue was the record of police in performance of their duties. The year 1950 witnessed an almost general improvement in clearing crimes by arrest of the guilty parties, though the level of such achievement was still substantially below pre-World War II levels for the relatively numerous burglaries and larcenies, and also inferior to comparable achievement by British forces.

The International Association of Chiefs of Police met in 58th annual congress at Miami, Fla. early in Nov. 1951, with more than 1,000 delegates and official guests attending. (*See* also CRIME; FEDERAL BUREAU OF INVESTIGATION; SECRET SERVICE, U.S.)

Polo.

The National Inter-Circuit and Twelve Goal tournaments were held in 1951 at the Oak Brook Polo club, Hinsdale, Ill., where Healy Farms, representing the central circuit, defeated the Dallas team of Texas, becoming the National Inter-Circuit champions. However, in the finals of the National Twelve Goal, Dallas defeated Healy Farms in a sudden death period 4 to 3.

The National Twenty Goal championship was awarded to the Arlington Farms club of Libertyville, Ill. This tournament was won by the home team, Arlington Farms, by a score of 8 to 6, defeating the Sun team which represented the Oak Brook club.

A National East-West series was also held at Arlington Farms during August. This was a two-out-of-three series which the West won. These two teams then moved to Meadow Brook on Long Island, N.Y., for another two-out-of-three series which the West won in the first two games, taking the title of national champions.

The National Open championship and Monty Waterbury Memorial tournaments immediately followed the East-West series. The Open was won by the Milwaukee team, which defeated the Meadow Brook quartet 6 to 2. The Waterbury was also won by a western team, the Oak Brook Triple Cs from Evanston, Ill., who defeated the well-known Long Island Hurricane team 9 to 8. (L. M. L.)

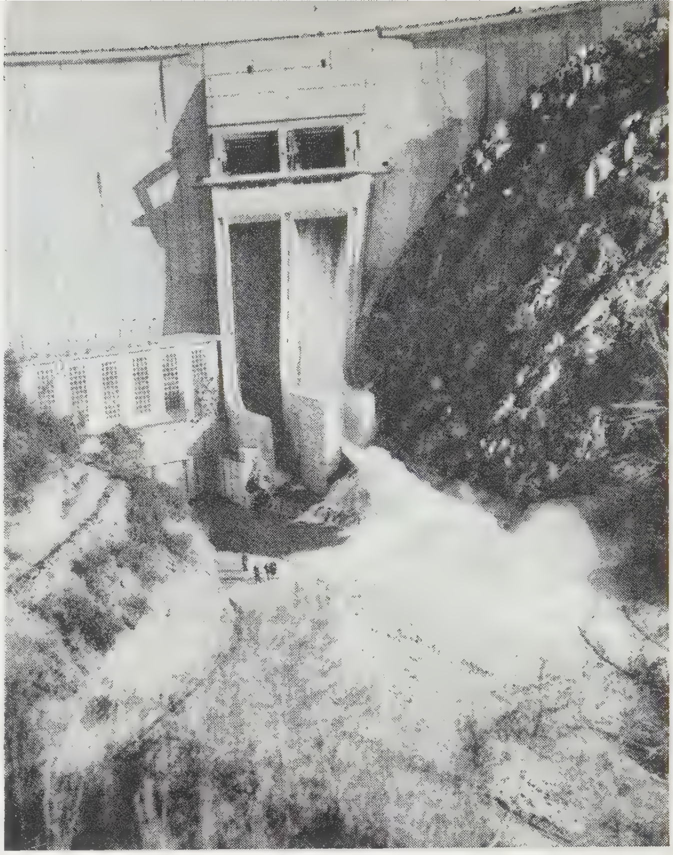
Portugal.

A republic of southwestern Europe, Portugal forms part of the Iberian peninsula and is bounded east and north by Spain. Area: 35,415 sq.mi., including the Azores (888 sq.mi.) and Madeira (302 sq.mi.). Pop.: (1940 census) 7,722,152; (1950 census, preliminary figures) 8,490,000, including Azores (1940 census, 286,885) and Madeira (250,124). Language: Portuguese. Religion: predominantly Roman Catholic. Chief towns (pop., 1940 census): Lisbon (cap., 709,179); Oporto (262,309); Funchal, Madeira (54,856); Coimbra (35,437). Presidents of the republic in 1951: Marshal Antonio Oscar de Fragoso Carmona and, from July 22, Gen. Francisco Higino Craveiro Lopes (*q.v.*); prime minister, Antonio de Oliveira Salazar.

History.—The death on April 18, 1951, of Marshal Carmona brought the first break in continuity in the supreme direction of the new state since its inception in 1926. One candidate for the succession, Ruy Luis Gomes, was vetoed by the supreme court on refusing to repudiate communism. Another, the 70-year-old Adm. Manuel Carlos de Quintão Meireles, foreign minister under Salazar in 1928–29, withdrew three days before the election on July 22 on the ground that he had been refused "essential conditions." The government nominee, General Lopes, was duly elected on July 22 with 896,397 votes out of a total electoral roll of 1,158,000. The new president stated his belief that no change in the policy of the state was necessary.



ZEZERE DAM, opened 90 mi. N. of Lisbon, Port., early in 1951. Construction of the dam and generating plant was by a British firm

Gen. Dwight D. Eisenhower visited Lisbon for defense discussions in January. On Sept. 6 Portugal signed with the United States an agreement giving the latter "certain new rights" in the Azores; eventually, it was expected, this would enable the North Atlantic treaty powers to use bases there for common defense purposes.

War matériel received from the United States under the Mutual Defense Assistance program included aircraft, projectile-launching platforms, heavy anti-aircraft guns and aeronautic tools and instruments. A bill proposing a three-year military expenditure program of £18,750,000 was announced in November. One thousand additional conscripts, representing about 20% of previous strength, were called up for the navy in January, and 24,000 army reservists for 20 days' instruction in October. The defense minister, Lieut. Col. Fernando dos Santos Costa, visited Spain in May and inspected military establishments in the Pyrenees.

The 1950 financial year ended with a credit balance of 28,000,000 escudos. A one-year trade agreement with Denmark was signed in Lisbon in June, and in September a supplementary trade and navigation agreement with Germany. Fifty cardinals and bishops and almost 1,000,000 pilgrims were present at the Fatima shrine at Cova da Iria in October when Federico Cardinal Tedeschini closed the Holy Year ceremonies. (W. C. An.)

Education.—Schools (1948–49): primary 10,646, pupils 598,190, teachers 14,445; private elementary, pupils 60,158; secondary 42, pupils 19,997, teachers 1,096; private secondary, pupils 25,316; technical 67, pupils 36,533, teachers 1,591; commercial 8, pupils 3,095, teachers 217; colonial high school, students 113, professors 15; universities 3, students 8,883, professors and lecturers 475; institutions of higher education 4, students 5,576, professors and lecturers 278. Illiteracy (1940): 49%.

Finance and Banking.—Budget: (1950 revised est.) revenue 5,009,200,000 escudos, expenditure 5,117,700,000 escudos; (1951 est.) revenue 5,318,200,000 escudos, expenditure 5,315,200,000 escudos. National debt (1949 est.): 12,092,000,000 escudos. Currency circulation (July 1951): 7,930,000,000 escudos. Bank deposits (June 1951): 19,100,000,000 escudos. Monetary unit: escudo, with an exchange rate (Nov. 1951) of 28.75 escudos to the U.S. $1.

Foreign Trade.—(1950) Imports 7,884,000,000 escudos; exports 5,328,000,000 escudos. Main sources of imports (1950): U.K. 17.2%; Portuguese colonies 16.4%; U.S. 15.7%. Main destinations of exports (1950): Portuguese colonies 25.5%; U.K. 17.4%; U.S. 12.7%. Main imports (1950): wheat grain and flour 8.5%; industrial machinery 7.5%; petroleum and products 6.4%; raw cotton 5.8%. Main exports (1950): textiles 18.7%; cork and manufactures 16.8%; sardines and other tinned fish 9.6%; port and other wines 8.6%.

Transport and Communications.—Roads (1949): 16,697 mi. Licensed motor vehicles (Dec. 1950): cars 65,000; commercial 24,000. Railways: (1949) 2,246 mi.; passenger-miles (1949) 917,000,000; freight carried (1950) 3,324,000 metric tons. Shipping (merchant vessels of 100 gross tons and over, July 1950): 329; total tonnage 546,544. Telephones (1949): 134,426. Radio receiving set licences (1949): 187,385.

Agriculture.—Main crops (metric tons, 1950): wheat 606,000; barley 142,000; oats 133,000; maize 447,000; rye 208,000; rice, paddy, 135,000; potatoes 971,000; dry beans 47,000; grapes, total (1949) 1,360,000. Production of wine (1950) 7,250,000 hl. Production of olive oil (1950 est.) 38,000 metric tons. Livestock (Dec. 1948): cattle 1,000,000; sheep 4,000,000; pigs 1,200,000. Meat production (1950) 73,200 metric tons. Fisheries, total catch (1949): weight 203,243 metric tons; value 882,000,000 escudos.

Industry.—Fuel and power (1950): coal 426,000 metric tons; lignite 94,800 metric tons; manufactured gas 39,000,000 cu.m.; electricity 937,000,000 kw.hr. Raw materials (metric tons): lead (1950) 2,040; tin ores (1949) 2,654; wolframite (1950) 2,199; pyrites (1950) 613,521; cork (1949) 103,108; kaolin (1949) 21,941. Manufactured goods (metric tons, 1950): cement 572,000; cotton piece goods 28,000; cotton yarn 36,000.

Portuguese Overseas Territories.

Under this heading are grouped the Portuguese possessions in Africa and Asia. Their total area is approximately 803,835 sq.mi. and the total population (mid-1950 est.) 12,167,000. Areas, populations, capital towns and governors of the territories are given in the accompanying table.

History.—Violent earthquake shocks in the Azores in Jan. 1951 were followed in June and July by others in the Cape Verde Islands where the Ilha do Fogo volcano, inactive after 1857, erupted and the first lava streams in 200 years compelled the evacuation of several villages. Developments in Angola and Mozambique were chiefly in communications. A new bridge over the river Kwanza was among the largest in Angola; more than 23,500,000 escudos were spent on two others spanning the Giraul and the Baro. In Mozambique 14 bridges were completed, the quays at Lourenço Marques were lengthened by more than 300 m. and progress was made with the airfield at Nampula. A new shipping agreement of the Southeast African Outward Freight conference, designed to combat cargo congestion and delays at Beira, came into effect on Jan. 1. Adm. Ortins Bettencourt, general secretary for defense and former navy minister, headed a Portuguese delegation to the conference on African defense held in Nairobi in August.

Among constitutional changes voted by the national assembly in Lisbon, and approved by Antonio de Oliveira Salazar as acting president on Marshal Antonio de Fragoso Carmona's death, was the integration of the Colonial act of 1930, with minor revision, into the constitution. By the revised act the colonies were renamed overseas provinces and the ministry of colonies became ministry of overseas territories (*ministério do ultramar*). Commenting on the proposed changes in Delhi on March 12, and parodying the wording of the Colonial act, Jawaharlal Nehru said: "It is of the organic essence of the Indian nation and of the historic process that brought independence to India to free those parts of India which are still under colonial rule. The government of India will adhere to the policy which has been so frequently reiterated." Eight schools for mixed teaching in Portuguese and Urdu were established in the various territories of Portuguese India.

Macao continued dependent on the mainland for its fresh food supply. Apart from garrison movements—three-fourths of the 4,000 troops were Portuguese—there was very little direct traffic with Portugal. A reconstruction grant of 15,000,000 escudos to repair war damage in Timor dating from the Japanese occupation was voted by the home government in January.

(W. C. AN.)

Angola.—Principal products (exports, 1950, metric tons): maize 189,500, sugar, raw 43,100, coffee 37,600, beans 27,900, sisal 21,300, palm oil 13,800, diamonds (carats) 672,985. Foreign trade (1950): imports 1,665,500,000 escudos, exports 2,169,000,000 escudos. Roads (1949): 21,772 mi. Railways (1949): 1,771 mi. Shipping (1949): vessels entered 3,748, net tonnage 3,638,530. Budget (1950 est.): balanced at 845,246,000 angolars. Monetary unit: angolar at par with escudo. U.S. $1 = 28.75 escudos.

Cape Verde Islands.—Principal products (exports, 1950, metric tons): mineral oil 356,300, coal 36,100, fish 490. Foreign trade (1950): imports 245,700,000 escudos, exports 227,600,000 escudos. Shipping (1949): vessels entered 4,126, net tonnage 2,807,822. Budget (1950 est.): balanced at 33,550,000 escudos.

Guinea.—Principal products (exports, 1949, metric tons): groundnuts 44,300, coconuts 17,300, palm oil 1,190. Foreign trade (1949): imports 142,200,000 escudos, exports 160,800,000 escudos. Shipping (1948): vessels entered 83, net tonnage 103,502. Budget (1950 est.): balanced at 74,650,000 escudos.

São Tomé and Principe Islands.—Principal products (exports, 1950, metric tons): cocoa 8,000, coconuts 7,200, copra 5,100, palm oil 2,800. Foreign trade (1950): imports 109,100,000 escudos, exports 209,500,000 escudos. Shipping (1948): vessels entered 118, net tonnage 451,862. Budget (1950 est.): balanced at 41,996,000 escudos.

Mozambique.—Principal products (exports, 1950, metric tons): sugar, raw 65,000, copra 42,900, cotton 24,400, sisal 17,300. Foreign trade (1950): imports 1,653,900,000 escudos, exports 1,063,800,000 escudos. Roads (1949): 18,078 mi. Railways (1949): 1,652 mi. Shipping (1949): vessels entered 1,988, net tonnage 6,905,468. Budget (1951 est.): balanced at 1,535,650,462 escudos.

India.—Foreign trade (1947): imports 338,900,000 escudos, exports 50,500,000 escudos. Budget (1950 est.): balanced at 86,098,000 escudos.

Macao.—Foreign trade (1948): imports 82,400,000 patacas, exports 16,600,000 patacas. Shipping (1948): vessels entered 12,265, net tonnage 1,897,125. Budget (1950 est.): balanced at 87,301,000 escudos. Monetary unit: pataca = 16.07 escudos.

Timor.—Foreign trade (1949): imports 37,600,000 escudos, exports 13,400,000 escudos. Shipping (1949): vessels entered 115, net tonnage 29,096. Budget (1949 actual): revenue 62,047,000 escudos, expenditure 48,353,000 escudos.

Post Office.

United States.—Revenues of the post office department for the fiscal year 1950–51 amounted to $1,776,816,354.19. Additional postage that would have been collected if the service had been on a regular pay basis in the case of penalty and franked mail, free-in-county mail, differentials in second-class mail matter and free matter for the blind and the cost of aircraft service over the postage revenue derived from air mail was estimated at $104,900,000.

The expenditures of the department for the fiscal year amounted to $2,341,399,065.57, of which amount $115,603,222.21 was on account of prior years. There was $232,131,726.85 unpaid on account of the 1951 fiscal year. This left a total expense of $2,457,927,570.21, resulting in a gross operating deficit on accrual of $681,111,216.02.

During the fiscal year ended June 30, 1951, 1,239,500,000 free pieces weighing 91,000,000 lb. were mailed for other government departments, an increase of 9,000,000 pieces and 3,500,000 lb. over 1950.

On June 30, 1951, war savings stamps were on sale at 41,-

U.S. MAIL TRUCK operating on one of 18 routes established by the post office in 1951 for speeding bulk mail on short-haul runs from railroads and from post office to post office

193 offices. Sales from July 1, 1950, to June 30, 1951, amounted to $14,518,796.30. During the fiscal year savings bonds with a sale value of $267,191,418.75 were sold. At the close of the fiscal year 1951, bonds were on sale at 26,477 post offices.

Through the 41,193 post offices and 4,002 stations being conducted under contract agreement, as well as 2,386 stations and branches, there were received in the domestic mails and from foreign sources, transported and delivered 46,908,000,000 pieces of mail matter during the fiscal year having a weight of 11,909,000,000 lb., an increase of 1,844,000,000 pieces and an increase of 388,000,000 lb. from the previous year.

During 1951 it was impossible to deliver 22,935,365 letters, an increase of 21.21% from the previous year. A total of 3,663,036 letters were returned to senders. Letters containing valuable enclosures numbered 453,128, of which 107,131 contained money amounting to $236,131.62. There were also 851,890 unclaimed parcels and articles found loose in the mails. A total of 132,733 were returned to the senders.

The remaining 719,157 parcels were sold at public auction and $288,069.34 was realized.

On June 30, 1951, there were 163,000 mi. of domestic air mail routes in the United States—an increase of 4,023 mi. over the previous year.

Rural Delivery.—The rural delivery routes in operation on June 30, 1951, required a total daily travel of 1,479,509 mi. by rural carriers in providing service to approximately 33,316,544 patrons. Operation of the service resulted in an expenditure of $168,762,382 for the fiscal year, compared with $162,787,400 for the previous year.

Postal Savings.—Postal savings depositors numbered 3,529,527 for 1951, a decrease of 6.62% from the preceding year. The balance due depositors by outstanding certificates of deposits was $2,787,918,244, a decrease of $309,143,613 or 9.98%. In addition there was held in trust for depositors accrued interest of $109,127,794.29 and unclaimed deposits of $280,766, making a total of $2,897,326,804.29.

Buildings.—During the fiscal year ended June 30, 1951, the post office department operated 3,169 government-owned buildings.

Change in Postage Rates.—During the first session of the 82nd congress the rates on certain classes of mail and special services were increased. Effective on Jan. 1, 1952, the rate on postal cards issued by the post office department was increased from one to two cents each. When sold in quantities of 50 or more there was an additional charge of 10% of the postage value. A rate of two cents for each ounce was fixed on drop letters and other first class matter mailed for local delivery through post office boxes or general delivery windows at post offices where city letter carrier service is not established. On second class mail there was no change in the rate within the county of publication except that each individually addressed copy should be not less than one-eighth of one cent unless free-in-county privilege is applicable. Outside the county of publication the rate of postage was increased by 10% beginning April 1, 1952. Two additional increases of 10% each over postage chargeable at existing rates, were to become effective April 1, 1953, and April 1, 1954, respectively. Such increases would not apply to newspapers or periodicals maintained by and in the interest of nonprofit religious, educational, scientific, philanthropic, agricultural, labour, veterans' or fraternal organizations or associations, or to religious, educational or scientific publications designed specifically for use in school classrooms or in religious instruction classes.

On third class mail the rate on books and catalogs having 24 pages or more, as well as on seeds and bulbs, was fixed at two cents for the first 2 oz. and one and one-half cents for each additional 2 oz. Bulk mailings of circulars and other miscellaneous printed matter took a rate of 14 cents per pound, with a minimum charge of one and one-half cents per piece. The effective date was fixed at July 1, 1952. Special delivery fees were raised to 20 cents, effective Jan. 1, 1952. On June 1, 1951, parcel post rates were increased and became effective Oct. 1, based on zone rates.

On July 1, 1952, sale of postal notes by post offices throughout the country was discontinued. (I. Gg.)

Canada.—The post office reported a deficit for the year 1950–51: total revenue, $105,545,456; total expenditures, $106,872,245. As a result, there was a tightening up of services and increases in rates. Open-faced notes went from one to two cents; printed matter increased from one cent to two cents for the first ounce; book and parcel post rates and registration fees went up; the charges for mailing newspapers to subscribers went from one and one-half to three and one-fourth cents per pound. The two-a-day mail deliveries for urban areas were cut to one. There were about 12,800 post offices in Canada in 1951, 185 more than in 1946.

Potatoes. The U.S. 1951 white potato crop of 325,708,000 bu. was 24% less than the 429,896,000 bu. of 1950 and also less than the 1940–49 average of 410,203,000 bu. The 1,353,000 ac. harvested were about 20% less than in 1950 and much below the 2,564,000 ac. average for the decade 1940-49. The 240.7 bu. per acre average yield was about 5% below the 1950 record of 253.4 bu. per acre, but much above the 164 bu.

Table I.—*Potato Production by Leading States*

(In thousands of bushels)

State	1951	1950	Average 1940–49
Late Crop			
Maine	45,835	63,360	59,654
Idaho	37,520	49,200	37,379
New York	27,900	34,390	32,145
Pennsylvania	16,215	19,920	19,176
North Dakota	15,580	21,280	19,589
California	12,800	15,840	12,490
Minnesota	11,900	16,275	18,147
Washington	11,600	11,780	9,254
Colorado	11,475	18,200	17,313
Oregon	11,220	12,920	10,736
Michigan	10,800	15,300	17,775
Wisconsin	9,805	13,400	12,708
Nebraska	6,000	11,180	10,542
Ohio	5,750	7,650	7,731
Intermediate Crop			
New Jersey	7,476	12,502	11,213
Virginia	6,882	7,964	8,998
Kentucky	1,960	2,002	3,546
Missouri	1,456	2,096	3,446
Arizona	1,387	1,764	1,179

Czechoslovakia	240,000	275,000	371,415

*Preliminary.

average for the decade. The late potato crop was 255,937,000 bu. (338,659,000 bu. in 1950), with Maine as usual the leading state.

The 1951 crop was the first after 1942 not under mandatory price supports, and the consumer paid rather dearly. Average prices to farmers for the year were estimated at $1.53 per bushel (92 cents in 1950), and the small crop of 1951 was valued at $497,367,000, as compared with $392,526,000 for the previous large crop. Potato price ceilings 5% to 10% below existing prices were ordered effective Jan. 19, 1952, by the Office of Price Stabilization.

Imports in 1950–51 were 191,004,000 lb. of certified seed and 129,947,000 lb. of table stock.

The world potato crop of 1951 was preliminarily estimated at 7,800,000,000 bu., 10% less than 1950 and 6% below the pre-World War II average.

Sweet Potatoes.—The U.S. sweet potato crop of 1951 was the smallest crop since 1881; the 28,278,000 bu. production was 43% below 1950 and comparable with an average of 61,148,000 bu. for 1940–49. Only 308,000 ac. were harvested as compared with 492,000 ac. in 1950 and a decade average of 666,000 ac. The 1951 official guide was 573,000 ac. Louisiana, as in most years, was the leading state with a production of 6,400,000 bu. (10,914,000 bu. in 1950), and North Carolina second with 3,760,000 bu.

An average yield of 91.8 bu. per acre approximated the 1940–49 average, but was less than the 1950 average of 101.2 bu. The recommended goal for 1952 was 54,000,000 bu., which at average yields would require 550,000 ac. The average price to farmers for the 1951 crop was estimated at $2.83 per bushel compared with $1.73 in 1950. (*See* also VEGETABLES.) (J. K. R.)

Presbyterian Church.

The churches with the Presbyterian form of representative government, united in the western section of the Alliance of Reformed Churches throughout the world holding the Presbyterian system, and located in the United States, are as follows: Presbyterian Church in the U.S.A. (Northern); Presbyterian Church in the U.S. (Southern); United Presbyterian Church; Evangelical and Reformed Church; Reformed Church in America; Christian Reformed Church; Cumberland Presbyterian Church; Cumberland Presbyterian Church (Colored); Associate Reformed Presbyterian Church, General Synod; Synod of the Reformed Presbyterian Church; Reformed Presbyterian Church, General Synod; Associate Presbyterian Church Synod.

In 1951 this group numbered approximately 18,600 ministers, 18,700 churches, and a communicant membership of 4,675,000. The Presbyterian Church in Canada and the United Church of Canada were also members of the western section. The Orthodox Presbyterian Church and the Bible Presbyterian Church, originating in the 1930s, were not members of the alliance.

In the home mission field during 1951 the rapid growth of industrial areas within the country had led to church establishments by the various Presbyterian groups. The Evangelical and Reformed Church projected a campaign for raising $1,000,000 for financing churches in such areas. In the field of foreign missions the plight of the Koreans resulted in an active relief program. Appeals for clothing, supplies and financial support provided extensive aid to the distressed of Korea. To meet communistic propaganda the Presbyterian Church, U.S.A., adopted a Christian evangelistic approach and used the youth and young churches to spread the Christian message. It called upon the churches to undergird their work with a greater reliance on prayer and to call for a new dedication of their youth to missionary service.

New channels for extending the spiritual message of the church were opened to churches of the alliance. The Department of Radio and Television, in presenting its report to the general assembly of the Presbyterian Church, U.S.A., in 1951 emphasized the extensive use of television and radio. Presbyterian and Reformed Churches were also active participants in the Protestant Broadcasting and Film commission of the National Council of Churches. Preaching services were conducted on the "Columbia Church of the Air" and in the coast-to-coast "National Vespers" program of the American National Broadcasting service. Television programs utilized motion pictures and puppets to bring to children the Christian message through the "Lamp Unto My Feet" and "The Good Samaritan." The audio-visual *Vanguard* was issued to acquaint Presbyterians with what the various boards of the Presbyterian Church were doing with the religious programs on radio and television.

Europe.—The eastern section of the alliance consisted of Reformed and Presbyterian Churches in England, Scotland, Wales, Ireland, France, Belgium, the Netherlands, Switzerland, Hungary, Germany, Spain, Italy, Czechoslovakia, Poland, Lithuania, Yugoslavia, South Africa, Australia and New Zealand. In Aug. 1951 there were 19 members and alternates from 10 countries and 5 continents, at a meeting of the executive committee of the alliance in Basle, Switz. At this meeting it was announced that the Presbyterian Church of the Gold Coast, the United Church of Christ in the Philippines, and the Presbyterian Church of Formosa had become members of the alliance. (*See* also CHURCH MEMBERSHIP.) (G. S. K.)

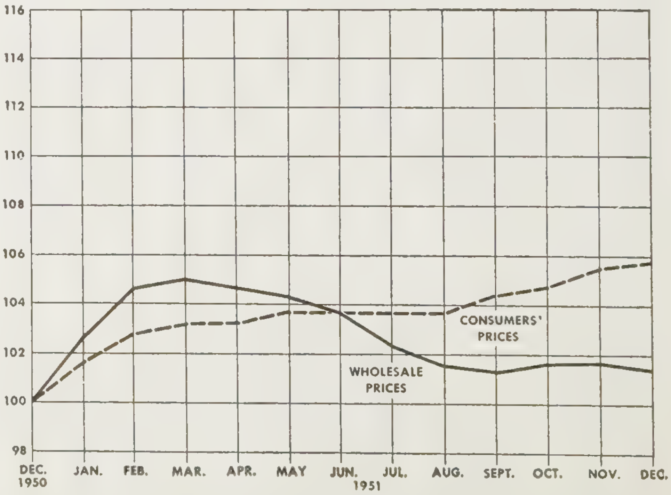
Presidents, Sovereigns and Rulers.

The following list includes the names of those holding chief positions in their countries as of Jan. 1, 1952:

Country	Name and Office	Accession
Afghanistan	Mohammad Zahir Shah, King	1933
	Shah Mahmud Khan, Prime Minister	1946
Albania	Omer Nishani, Chairman of the Praesidium of the People's Assembly	1946
	Gen. Enver Hoxha, Prime Minister	1944
Arabia, Saudi	'Abd-al-'Aziz ibn 'Abd-al-Rahman ibn Faisal ibn Sa'ud, King	1927
Argentina	Gen. Juan Domingo Perón, President	1946
Australia	Sir William John McKell, Governor General	1947
	Robert Gordon Menzies, Prime Minister	1949
Austria	Theodor Koerner, President	1951
	Leopold Figl, Chancellor	1945
Bahrein	Sulayman bin Hamid al-Khalifa, Sheikh	1942
Belgium	Baudouin I, King	1951
	Joseph Pholien, Prime Minister	1950
Bolivia	Gen. Hugo Ballivián, President	1951
Brazil	Getulio Dornelles Vargas, President	1951
Bulgaria	Georgi Damianov, Chairman of the Praesidium	1950
	Vulko Chervenkov, Premier	1950
Burma	Sao Shwe Thaik, President of the Union of Burma	1948
	Thakin Nu, Prime Minister	1948
Canada	Field Marshal Viscount Alexander of Tunis, Governor General	1946
	Louis Stephen St. Laurent, Prime Minister	1948
Ceylon, Dom. of	Lord Soulbury, Governor General	1949
	Don Stephen Senanayake, Prime Minister	1948
Chile	Gabriel González Videla, President	1946
China	Chiang Kai-shek, President of the National Government	1943
	Gen. Chen Cheng, Premier	1950
China, People's Republic of	Mao Tse-tung, Chairman of the Central People's Government of the People's Republic of China	1949
Colombia	Roberto Urdaneta, Acting President	1951
Costa Rica	Otilio Ulate Blanco, President	1949
Cuba	Carlos Prío Socarrás, President	1948
Czechoslovakia	Klement Gottwald, President	1948
	Antonín Zápotocký, Prime Minister	1948
Denmark	Frederick IX, King	1947
	Erik Eriksen, Prime Minister	1950
Dominican Rep.	Gen. Rafael Leónidas Trujillo y Molina, President	1942
Ecuador	Galo Plaza Lasso, President	1948
Egypt	Farouk I, King	1936
	Mustafa el-Nahas Pasha, Prime Minister	1950
Ethiopia	Haile Selassie I, Emperor	1930
	Bitwoded Makonnen Endalkatchou, Prime Minister	1944
Finland	Juho K. Paasikivi, President	1946
	Urho K. Kekkonen, Prime Minister	1950
France	Vincent Auriol, President of the Fourth Republic	1947
	René Pleven, President of the Council of Ministers (Premier)	1950
Germany (East)		
German Democratic Rep.	Wilhelm Pieck, President	1949
	Otto Grotewohl, Minister-President (Premier)	1949
(West) Federal Rep. of Germany	Theodor Heuss, President	1949
	Konrad Adenauer, Chancellor	1949
Great Britain	George VI, King	1936
	Winston Churchill, Prime Minister	1951
Greece	Paul I, King	1947
	Nicholas Plastiras, Prime Minister	1951
Guatemala	Jacobo Arbenz Guzmán, President	1951
Haiti	Paul E. Magloire, President	1950
Honduras	Juan Manuel Gálvez, President	1949
Hungary	Sándor Rónai, Chairman of the Praesidium of the National Assembly	1950
	István Dobi, Prime Minister	1948
Iceland	Sveinn Björnsson, President	1944
	Steingrimur Steinthorsson, Prime Minister	1950
India, Rep. of	Rajendra Prasad, President	1950
	Jawaharlal Nehru, Prime Minister	1947
Indochina		
Cambodia	Norodom Sihanouk, King	1941
Laos	Sisavang Vong, King	1945
Viêt-Nam	Bao Dai, Chief of State	1949
Viêt-Nam, Democratic Rep.	Ho Chi Minh, (Communist) President	1945
Indonesia	Achmed Sukarno, President	1949
	Sukiman Wirjosandjojo, Prime Minister	1951
Iran	Mohammed Riza Pahlavi, Shahanshah	1941
	Mohammed Mossadegh, Prime Minister	1951
Iraq	Feisal II, King	1939
	Abdul-Ilah, Prince Regent	1939
	Nuri Pasha es-Said, Prime Minister	1950
Ireland, Rep. of	Sean T. O'Kelly, President	1945
	Eamon de Valera, Prime Minister	1951
Israel	Chaim Weizmann, President	1948
	David Ben-Gurion, Prime Minister	1948
Italy	Luigi Einaudi, President	1948
	Alcide de Gasperi, Prime Minister	1946
Japan	Hirohito, Emperor	1926
	Shigeru Yoshida, Premier	1948
Jordan	Talal I, King	1951
	Tewfik Pasha Abu-Huda, Prime Minister	1950
Korea (South)		
Rep. of Korea	Syngman Rhee, President	1948
(North) Democratic People's Rep. of Korea	Kim Il Sung, Premier	1948
Kuwait	'Abdullah bin Salim al-Subah, Sheikh	1950
Lebanon	Sheikh Bishara al-Khuri, President	1943
	Abdullah al-Yafi, Prime Minister	1951
Liberia	William V. S. Tubman, President	1944
Libya	Idris I, King	1951
	Mahmud Muntasir, Prime Minister	1951
Liechtenstein	Franz Josef II, Sovereign Prince	1938
	Alexander Frick, Prime Minister	1945
Luxembourg	Charlotte, Grand Duchess	1919
	Pierre Dupong, Premier	1937
Mexico	Miguel Alemán, President	1946
Monaco	Rainier III, Prince	1949
Morocco	Sidi Mohammed ben Youssef, III, Sultan	1927
	Gen. Augustin Guillaume, French Resident General	1951
Nepal	Tribhubana Bir Bikram Shah Deva, King	1911
	Matrika Prasad Koirala, Prime Minister	1951
Netherlands	Juliana, Queen	1948
	Willem Drees, Prime Minister	1948
New Zealand, Dom. of	Lieut. Gen. Sir Bernard Freyberg, Governor General	1946
	Sidney George Holland, Prime Minister	1949
Nicaragua	Anastasio Somoza, President	1950
Norway	Haakon VII, King	1905
	Oscar Torp, Prime Minister	1951
Oman (Muscat)	Sir Sayyid Said bin Taimur, Sultan	1932
Pakistan	Ghulam Muhammed, Governor General	1951
	Khwaja Nazimuddin, Prime Minister	1951
Panamá	Alcibiades Arosemena, President	1951
Paraguay	Federico Chaves, President	1949
Peru	Gen. Manuel A. Odría, President	1950
Philippines, Rep. of the	Elpidio Quirino, President	1948
Poland	Boleslaw Bierut, President	1947
	Jósef Cyrankiewicz, Prime Minister	1947
Portugal	Gen. Francisco Higino Craveiro Lopes, President	1951
	Antonio de Oliveira Salazar, President, Council of Ministers (Prime Minister)	1932
Rumania	Constantin Parhon, Chairman of the State Praesidium	1948
	Petru Groza, Prime Minister	1945
Salvador, El	Lieut. Col. Oscar Osorio, President	1950
South Africa	Ernest George Jansen, Governor General	1951
	Daniel F. Malan, Prime Minister	1948
Spain	Gen. Francisco Franco, Chief of State (President of the Council of Ministers)	1938
Sudan	Sir Robert George Howe, Governor General	1947
Sweden	Gustav VI Adolf, King	1950
	Tage Erlander, Prime Minister	1946
Switzerland	Karl Kobelt, President, Swiss Confederation	1952
Syria	Col. Fawzi Silo, President	1951
Thailand	Phumiphon Adundet, King	1946
	Field Marshal Luang Pibul Songgram, Prime Minister	1948
Tunisia	Sidi Mohammed el-Amin, Bey	1943
	Jean de Hautecloque, French Resident General	1951
Turkey	Celâl Bayar, President	1950
	Adnan Menderes, Prime Minister	1950
Union of Soviet Socialist Republics	Nikolai Mikhailovich Shvernik, Chairman of the Praesidium of the Supreme Soviet	1946
	Generalissimo Joseph V. Stalin, Chairman of the Council of Ministers	1946
United States	Harry S. Truman, President	1945
Uruguay	Andrés Martínez Trueba, President	1951
Vatican City	Pius XII, Pope	1939
Venezuela	Germán Suárez Flámerich, President	1950
Yemen	Sayf al-Islam Ahmad ibn Yahya, King	1948
Yugoslavia	Ivan Ribar, President of the Praesidium of the People's Assembly	1945
	Josip Brozovich or Broz (Tito), Premier	1944
Zanzibar	(Sir) Sayyid Khalifa bin Harub	1911
	Sir Vincent Gonçalves Glenday, British Resident	1946

Prices. In the United States, the inflationary trend which had moved both wholesale and retail price indexes to all-time peaks in Dec. 1950 continued into March 1951 for wholesale prices and throughout the year for retail prices. Wholesale prices fluctuated narrowly during the year and in December were only 1.4% higher than at the close of the previous year. Retail prices, on the other hand, climbed slowly but steadily until May, levelled off during the summer and then advanced each month from September to the end of the year, at which time they were at an all-time high, 5.8% higher than in Dec. 1950.

The increase in prices which had begun several months prior to and which had accelerated following the outbreak of the Korean war led to the adoption of an anti-inflationary program



WHOLESALE AND CONSUMERS' PRICES in the United States, Dec. 1950-Dec. 1951 (Dec. 1950=100) (Source: U.S. Department of Labor, Bureau of Labor Statistics)

Table I.—*Per Cent Increase in Wholesale Prices, by Major Commodity Groups, United States, Prewar Prices to Postwar High Points*

Commodity group	High post-World War II increase from Aug. 1939	High post-World War I increase from July 1914
All commodities	(March 1951) 145	148
Farm products	(March 1951) 234	138
Foods	(Aug. 1948) 182	137
Textile products	(March 1951) 170	252
Fuel and lighting materials	(Dec. 1951) 92	277
Metals and metal products	(Dec. 1951) 106	99
Building materials	(March 1951) 155	218
Hides and leather products	(Feb. 1951) 157	192
Chemicals and allied products	(April 1951) 99	123
Housefurnishings	(April 1951) 110	164
Miscellaneous	(Feb. 1951) 95	102

Source: Computed from data published by the Bureau of Labor Statistics of the U.S. Department of Labor. Except as otherwise indicated, all computations presented in this article are based on such data.

in January. This program aided in preventing a greater increase in prices which would probably have occurred as a consequence of a very high level of personal, business and governmental expenditures. Nevertheless, by December the wholesale price index was 137% and the consumers' price index 92% greater than in Aug. 1939.

Wholesale prices for each major group of commodities shown in Table I, except foods, reached their post-World War II highs in various months during the year, and foods virtually reached the Aug. 1948 level in October. Wholesale prices had advanced nearly as much percentagewise as after World War I, but there had been relatively substantial changes in the commodity groups in which price increases were greatest in the two periods.

All retail prices, as reflected by the cost-of-living index of the bureau of labour statistics, attained a postwar peak in December. The only components which did not reach their highest levels in December were apparel and housefurnishings.

When compared with the post-World War I increase in the cost of living, as shown in Table II, the price rise for all items following World War II was not so severe—92% as compared with 101%. Only in food (which, however, is a sizable item in the budget of a moderate-income family for which the cost-of-living index is computed) and fuels were the price increases in the later period relatively greater; and rents, apparel and miscellaneous items did not increase nearly so much.

Table II.—*Per Cent Increase in Cost of Living (Consumers' Retail Prices), by Major Items, United States, Prewar Prices to Postwar High Points*

Item	High post-World War II increase from Aug. 1939*	High post-World War I increase from July 1914
All items	92	101
Food	148	126
Apparel	108	176
Rent	33	51
Fuel, electricity, etc.	50	49
Housefurnishings	111	†
Miscellaneous	68	82

*The high points for apparel and housefurnishings were attained in September and May 1951, respectively. All other items reached new peaks in Dec. 1951.

†Not available.

Source: Computed from data published by the National Industrial Conference Board for the years 1914–20 and the Bureau of Labor Statistics for the period beginning with 1920.

As shown in Table III, wholesale prices were, at the end of 1951, 137% greater than in Aug. 1939, 90% greater than at the start of U.S. participation in World War II in Dec. 1941, 58% greater than at the termination of price controls in June 1946 and 13% above the level at the outbreak of the Korean war in June 1950. The wholesale price index rose to an all-time peak in March, declined gradually each month through September and remained relatively stable the remainder of the year. Prices in all commodity groups increased at the beginning of the year, and most groups were relatively stable the remainder of the year. The notable exceptions were substantial decreases in the prices of hides and textile products, and decreases in the prices of chemicals, farm products and housefurnishings from their peaks early in the year.

BALLOONS released by housewives of Washington, D.C., on the steps of the capitol in 1951 to dramatize the way they feared prices might go if congress did not continue anti-inflationary controls

Table III.—*Per Cent Change in Wholesale Prices, by Major Commodity Groups, United States, Selected Periods, 1939–51*

	Per cent change Dec. 1951 from							Dec. 1950 from

All commodities	—3.4	1.4	13.0	57.5	90.0	137.1		15.9

The steady increase in consumers' prices during the year reflected the greater relative increase in wholesale prices which had occurred after war broke out in Korea and limited increases in wages and other costs. Food prices, the most important item in the consumers' cost-of-living index, and apparel led the index upward throughout the year, although apparel prices fell toward the end of the year. Other items were relatively stable. By December, retail prices were 92% higher than in Aug. 1939, 71% greater than in Dec. 1941, 42% greater than in June 1946 and 11% above the level of June 1950, as shown in Table IV.

"EVERY TIME HE WAKES UP, I GIVE HIM ANOTHER DOSE," a 1951 cartoon by Burck of the *Chicago Sun-Times*

The rapid increase in prices following the outbreak of the Korean war demonstrated the inadequacy of voluntary controls, and the government inaugurated a comprehensive system of anti-inflationary controls during the year. Price controls were instituted on Jan. 25 with the issuance of a general ceiling price regulation by the Office of Price Stabilization. This regulation froze markups of wholesalers and retailers, and provided for discretionary imposition of ceiling prices for farm products only if prices were above parity levels. Wages were frozen by the Wage Stabilization board, but employees could seek increases up to a level approximately 10% above the prevailing wages in June 1950. Further wage adjustments, largely based on changes in the cost of living, were later permitted by the Wage Stabilization board. An amendment to the Defense Production Act of 1950, which had authorized the president to impose controls, permitted producers to raise prices to cover increases in costs from June 27, 1950, through July 26, 1951. Adjustments in wages and prices were made throughout the year to eliminate inequities resulting from the original freeze orders.

Indirectly, price inflation was combated by raising reserve requirements of banks, increasing taxation and restricting the extension of credit for housing and purchase of consumer durable goods. In addition, the specific priorities system of allocating strategic metals was replaced in July by the Controlled Materials plan administered by the National Production authority in order to assure defense production and to ease the competitive upward pressure on prices of metals in short supply. Voluntary credit restraints were imposed by the banks and other lending institutions.

During the year the national output, national income, personal expenditures and personal savings all reached record levels as the nation, engaged in war in Korea, activated a tremendous defense mobilization program and continued its extensive aid program abroad while maintaining the same level of civilian consumption at home as in 1950. The moderate increase in prices under these circumstances reflected both the effectiveness of direct and indirect anti-inflationary measures and the efficiency of production. In particular, the stability of the wholesale price index reflected a balancing of demand and supply at the close of the year. (W. V. Wi.)

Great Britain.—*Commodity Prices.*—Sterling prices of textile materials followed a common pattern. A rise between devaluation and the outbreak of war in Korea was followed by a larger rise in the nine months after June 1950 and then by a general decline, though with many fluctuations, in the last three quarters of 1951. The levels of prices at the end of 1951 were generally well above those before the Korean war. Wool prices showed particularly large fluctuations, with a peak in March 1951 more than double the pre-Korean war level followed by an even more abrupt decline. In the later months of 1951, however, wool prices tended to fluctuate less violently and around the June 1950 level. Much the same general movements were found in prices of rubber and tin. For nonferrous metals (other than tin) prices showed what was generally the most sustained increase from the time of devaluation (Sept. 1949) right through to the end of 1951. These stood in Dec. 1951 at two or three times the level before devaluation and generally 50% or more above those ruling before the Korean war. In general, the prices of sterling commodities such as wool, rubber, tin and cocoa improved relative to the prices of dollar commodities (nonferrous metals, cotton, tobacco, etc.) in the early part of 1951. This change was reversed by a much greater deterioration during the remainder of the year.

Import and Export Prices.—Though world commodity prices (and British wholesale prices of materials) declined after March 1951, the prices of United Kingdom imports showed no fall until after the middle of the year, the lag being accounted for by the interval between purchases at lower prices and the actual import of materials. On the average, import prices were 65% to

70% above the predevaluation level in June 1951 and 60% above at the end of the year.

The rise in British export prices was less rapid but more steady and prolonged than movements of import prices. The terms of trade, relatively favourable in the middle of 1949, became progressively worse following devaluation and the outbreak of war in Korea: the deterioration amounted to 33% by mid-1951. After June the fall in import prices and the continued rise in export prices both served to produce an improvement by about 10% at the end of 1951. The effect of the worsened terms of trade, particularly from mid-1950 to mid-1951, was to reduce the real national expenditure below the level of real national product; production increased but was in part diverted to exports, to pay for dearer imports.

Wholesale Prices.—Changes in prices of basic commodities in 1950–51 spread through the domestic price system, quickly for prices of materials, much more slowly for the prices of the output of industry. Materials prices fell by 18% in the last nine months of 1951, while the prices of industry's products remained firm.

Retail Prices.—The "all-items" index of retail prices moved very little from devaluation until Sept. 1950; it then began to show a steady and sustained rise of about one point a month and this continued throughout 1951. The influences operating varied from one group of prices to another. Food prices rose about as fast as the others since subsidies were not increased. Prices of clothing and household textiles rose sharply at first, since these reflected movements in the prices of raw materials to a greater extent than did some others. The later declines in prices of textile materials had still to show up significantly in retail prices by the end of the year. Household goods, particularly of metal, became much dearer from mid-1950 and prices were still rising late in 1951.

Europe.—Wholesale prices moved similarly in many European countries, a slow rise from mid-1949 to mid-1950 followed by a more rapid increase to a peak about the middle of 1951. The total rise from just before devaluation (Sept. 1949) to mid-1951 was generally 40%, as in the United Kingdom, or more.

Retail prices at mid-1951, as measured by the cost-of-living index numbers of Table VII, were about double the 1938 level in the United Kingdom and about 80% above 1938 in the United States. Germany, Sweden and Switzerland showed retail price rises of the same order, or less, as in the United States; Denmark, Norway and Ireland followed the United Kingdom pattern, with Netherlands prices having a greater rise.

Postwar prices in Belgium were about four times as high as in 1938.

Comparisons within the postwar period, however, showed more varied changes; *e.g.*, from Sept. 1949 to mid-1951 retail prices in Switzerland changed little; Denmark, Norway and the Netherlands had larger price rises than the United Kingdom; while in Sweden the jump in prices occurred only in the year from mid-1950. As an example of the factors at work, Norway's index of retail prices began to move upward in March 1950; subsequently, food subsidies were reduced and the price level mounted rapidly. Wage rates being tied by agreement to the cost-of-living index, though with a time lag, the problem of breaking the price-wage spiral became acute in 1951. Price Stabilization, Office of: *see* Defense Mobilization Agencies, U.S.

Primary Education: *see* Education.

Prince Edward Island. Smallest province of Canada, 2,184 sq.mi., Prince Edward Island lies in the Gulf of St. Lawrence. Population: (1951 census) 98,429. Capital: Charlottetown (1951 prelim. census) 15,689.

History.—On April 24, 1951, Prince Edward Island celebrated a century of responsible government. On that date, the province was in the throes of a provincial election, which resulted in the return to power for the third time of Liberal premier Walter Jones and the start of the 17th consecutive year of a Liberal regime. The legislature gave municipalities power to impose rental controls, after the federal government vacated the field.

Education.—Latest revised statistics for provincially controlled schools were for 1948: total enrolment 18,051, average daily attendance 14,774, teachers 680, total revenues $915,668.

Finance.—For the fiscal year ending March 31, 1952, total revenue was set at $7,459,818, and total expenditures at $9,324,898.

Transportation.—The provincial hard-surfacing program for highways added only 30 mi. during 1951, part of which was on the province's section of the Trans-Canada highway. The Canadian National railways bought a truck transport company so as to increase its service throughout the island. The Canadian maritime commission refused permission to build a steel year-round ferry to connect Wood Islands, P.E.I., with Caribou, N.S.

Agriculture and Fisheries.—Farm labour shortages and a 1950 glut of potatoes were reflected in a cut in the 1951 seed potato acreage to 21,234 (1950: 35,581 ac.). But the 1951 demand quickened, and the price rose to $1.50 per bushel on the farm. Production figures for 1950 included: potatoes 10,500,000 bu., butter 4,573,000 lb., cheese 712,000 lb., fluid milk 194,000,000 lb.

During the first nine months of 1951 (with similar 1950 figures in parentheses) 23,842,000 lb. (24,597,000 lb.) of fish were landed valued at $2,035,000 ($2,249,000).

Industry.—Canning facilities continued to expand until 52 canneries were packing fish and agricultural products. The establishment of a tourist and information branch brought more tourists in the first 11 months of 1951 than in all of 1950, and additional tourist accommodation was made possible through loans to private operators from the provincial government. (C. Cy.)

Printing. Improvements in printing equipment and processes during 1951 consisted in the refinement of existing methods rather than in revolutionary development. Three of the most important are described. The *Milwaukee Journal* (Wis.) announced the development of a method for printing three-colour process work in newspapers in which a set of three-colour plates can be produced in one-third the time required for a comparable set of four-colour plates. The 20-in. by 24-in. Curtis Color Analyst, made by Curtis laboratories, Los Angeles, Calif., was said to be the largest beam-splitting optical instrument of its kind. Its copyholders accept a full newspaper page and permit simultaneous viewing of black-and-white photographic separation prints, or black-and-white ink proofs of process half tones in full colour. The instrument controls permit optical variations in colour balance to be made to suit the observer.

Thus pellicle mirrors, front-surfaced mirrors, lights and colour filters, balanced to the primary colours of the printing inks, transform the black-and-white prints into a full-colour image superimposing the three images into one full-colour image. A meter for each print indicates the amount of variation from a balanced condition in terms of percentages of exposure time and dot sizes. With this variation as a guide, new prints can be made by the photographer to bring the separations into balance. If the prints are in balance, the Color Analyst image may indicate a need for some local correction. The artist can then retouch any one or all of the separations to obtain the desired result and check the result in the Analyst before sending the prints to the engraver.

A flying printing press was developed for the U.S. armed forces by the Harris-Seybold Company, Cleveland, O. The press prints by offset process and has a capacity of up to a 22½-in. by 30-in. sheet at a maximum speed of 6,500 sheets per hour. The press may be lashed into an aeroplane for fast transportation. It can be unloaded from the aeroplane, set up and ready to deliver printed material within two hours. The press is a self-contained pressroom with all necessary facilities stowed within its enclosing container. The packaged press weighs five tons. The ends of the plywood enclosing case are fitted with drawers for tools, parts, paper and supplies. The sides of the container can be set up like tables. The skid mounting of the press functions as the bottom of the shipping container. A jack is built into each of the four corners of the base. An all-directional bubble level indicates when the press is level. It was suggested that the principle of making heavy machinery mobile, if adopted by manufacturers whenever practicable, would permit the moving of production units after installation to facilitate production. Customarily, heavy equipment when once in place cannot be moved without great expense because of the necessity of making connections to water, gas and air.

Two important developments pertinent to publication printing were announced by the Bishop-Stansell Company, West Carrollton, O. The first of these was an automatic electrotype plate finishing machine which was said to eliminate 95% of the handwork formerly necessary to correct the printing level and imperfections in the face of the plate. The machine carries a travelling bed upon which the plate to be finished is placed face down. As the motor-driven bed motion commences, a series of two-inch knurled-face rollers in staggered formation are lowered upon the back of the plate. Each roller bears down under the force of weights. The pressure is applied through a cantilever-like action. A plate may be finished in 15 sec., more or less, according to the size of the page.

After passing through the finishing machine, the plates are shaved for uniform thickness and are then shaped to proper curvature for the press cylinders.

The other development announced by the Bishop-Stansell Company was a 0.010-in. thick tympan stock for rotary printing presses. The face of the stock is coated with a plastic, while the underside is coated with a graphite impregnated compound. Curved plates may be made with an all-over level surface or they may be relieved according to the printing values in the face of the plate; *i.e.,* the solids in a half-tone illustration require more pressure to print satisfactorily than the high-light areas. Conversely, in a level surface plate, make-ready is applied in the form of patches under the top sheet on the impression cylinder. In either case, the circumference of the relieved plate or the circumference of the impression cylinder cannot rotate in unison with its mate, because of the radial difference from the axis of the plate or from the axis of the impression cylinder. Consequently, there will be a slight slippage between the printing plate and the paper web resulting in two abnormal conditions: (1) rapid wear will take place in the high areas of the plate; and (2) a slurring effect will occur in the print. To correct this slipping condition, the top sheet on the impression cylinder is applied tautly and one or two notches of the reel are slacked off to permit a certain amount of looseness. Thus the top sheet of the packing or impression cylinder is caused to slip slightly (only a few thousandths of an inch) during the time the highest areas in the plate are in contact with the paper web. The slippage is aided by the slick coating on the underside of the top sheet. At these instants, the slacked-off top sheet and the paper web rotate in unison. The top sheet resumes its normal position immediately after pressure of the high areas in the plate on the web has been released. The plastic coating on the tympan permits repeated washing off of offset ink on the rotary press second-impression cylinder.

Prisoners of War.

Repeated appeals throughout the year 1951 by the International Committee of the Red Cross to the North Korean government to permit committee delegates to visit prisoner of war camps in North Korea, under the Geneva Prisoner of War convention, received no response.

The South Korean government and the United Nations command observed all provisions of the convention.

On Aug. 1 the North Korean government had reported the names of only 110 United Nations prisoners while the names of 148,792 North Koreans and 14,347 Chinese prisoners had been

CLEARINGHOUSE for information about the more than 13,000 Alsatians missing since they were conscripted by the Germans during World War II. Many were believed to be in soviet labour camps in 1951. Occasionally returnees identified a man's portrait, giving new hope to his family

registered with the International Committee of the Red Cross by the South Korean government and United Nations command.

Relief dispatched by the I.C.R.C. to civilian victims and prisoners of war in North Korea was turned back by Communist authorities at the frontier.

Through the efforts of the French Red Cross, a certain number of prisoners of war and civilian internees were exchanged between the opposing forces in Viêt-Nam. Later, on July 26, a meeting was held in a neutralized zone between a representative of the International Committee of the Red Cross and the president of the Viêt-Nam Democratic Red Cross in an attempt to enlarge the scope of these exchanges.

The *ad hoc* Prisoner of War commission created by the United Nations general assembly in 1950 addressed a note to all governments calling for the names of World War II prisoners still held by them and the reasons for their detention. Burma, Canada, Norway, the Philippines, the United Kingdom and Yugoslavia transmitted such lists. The soviet bloc declined to reply on the ground that the resolution creating the commission was contrary to article 107 of the United Nations charter. All other countries reported that they held no prisoners of war.

Article 16 of the Japanese peace treaty signed in San Francisco, Calif., provided that the International Committee of the Red Cross take the necessary measures to have Japanese assets available abroad utilized to assist former prisoners of war of the Japanese and to aid the relatives of those who died in captivity or who suffer from the effects of such captivity. (*See* also JAPANESE PEACE CONFERENCE; RED CROSS.) (H. W. DG.)

Prisons.

At the close of 1951 there were in the United States 152 state correctional institutions for adults which included 68 prisons or penitentiaries, 26 reformatories for men, 25 reformatories for women, 22 farm institutions, 11 special institutions including 3 hospitals for the criminal insane and 4 institutions for defective delinquents. This number of state institutions was exclusive of the federal prison system, which comprised six penitentiaries, three reformatories for men and one for women, a medical centre, a detention facility, eight correctional institutions, three camps, a training school and a forestry camp for boys.

The prison population at the end of 1950, according to the information available at the close of 1951, numbered 167,173 in state and federal prisons and reformatories. This represented an increase of 2,046 or 1.2% over the number confined in these institutions at the end of 1949. The number of prisoners committed by the courts during 1950 totalled 71,978 which was an increase of less than 0.5% compared with the total number of 71,703 committed during 1949. As shown in the table, there were 10% fewer persons in prison at the end of 1950 than at the end of 1939 and 7% fewer persons were sent to prison during 1950 than during 1940.

During 1950 more than 75,000 prisoners were released from prison. Less than half, or about 32,500, were released unconditionally; the remainder, about 42,500, were released under various forms of conditional discharge, of which about 80% were paroled.

Prison Population in State and Federal Prisons and Reformatories

(Dec. 31 of each year)

*Rate per 100,000 estimated civilian population.

There was little important legislation relating to prisons enacted in 1951 by the various state legislatures. Perhaps the most interesting legislation was the passage of an act by the Maine legislature which would permit an interstate compact affecting Maine, New Hampshire and Vermont for the construction and operation of correctional and other types of institutions through the establishment of a tristate facilities authority. Protestant Episcopal Church.

According to the statistics published in the *Living Church Annual, 1952*, several all-time highs were reported in 1951: 2,643,488 church members (baptized persons); 1,712,070 communicants; 6,805 clergy; 6,447 lay readers; 88,727 confirmations; 62,877 teachers and 543,167 pupils in its church schools; and total receipts of $81,946,472.10, or an increase of $8,100,000 or 10.9% over the preceding year.

The acute shortage of clergy, caused by World War II, was beginning to be made up by record ordinations: deacons, 287; priests, 276; candidates for orders, 566; and 1,210 postulants (those listed by the bishops as desiring ordination). The theological seminaries were unable to accept all applicants. Yet the church was still seriously undermanned, having fewer active clergy in 1950 than it had 25 years before.

Baptisms, totalling 109,289, were 1,329 fewer than during the record year of 1948, but the number of adult baptisms 19,341 of the total, was a record. Marriages 30,426, were 6% greater than during the preceding year but far less than the record year of 1943 when they totalled 41,970. Burials 54,316, were the only item in the list which showed a decrease: 1,038 or 1.9% less than the preceding year.

During the century 1851–1950, the rate of increase in the number of the clergy had lagged far behind the growth in membership: while the latter increased 1,635%, the number of clergy increased only 326.6%. In 1851, each of the 1,595 clergy (active and retired) had on the average only 61 communicants under his pastoral care; in 1951 each of the 6,805 clergy (active and retired) had on the average 251 communicants under his pastoral care. This indicated that several years of record ordinations were necessary to enable the church to undertake a program of expansion and thus be able to meet its responsibilities and to take advantage of its opportunities. Psychiatry.

Various studies were under way in 1951 on the role of tensions, anxieties and hostilities in the field of labour and industry. Investigations in the field of education continued to deal not only with the mentally retarded child but also with the child who is emotionally disturbed and thereby impaired in his school progress. Another aspect of

GROUP PSYCHIATRY demonstrated by staff members of the Phipps clinic at the Johns Hopkins hospital, Baltimore, Md., where the method was practised in 1951. As a new approach to mental illness, it assumed that patients could help each other in solving emotional problems

interest in 1951 was that of civil defense, with special reference to the avoidance of panic.

In the field of law, progress was made in the study of the so-called psychopathic sexual offender. The number of states with "sexual psychopath" laws was increasing, and it appeared that the public was becoming more aware of the fact that many sexual offenders are abnormal mentally and that their problems and the problems of society which they create are not to be solved by ordinary penal methods. Alcoholism was another field in which the public was coming to realize that the penal methods had failed and that the alcoholic is essentially a sick man. During 1951 the drug "antabuse" was placed on sale (on prescription only). So long as an individual is taking antabuse the use of even a small amount of alcohol will make him extremely ill.

The drug is not a permanent cure, but it does reduce the amount of time devoted to excessive drinking, and is of aid in psychotherapy. It has distinct dangers, however, and should be used only with caution and under the supervision of an experienced physician.

The relation of psychiatry to the other specialties was being more widely recognized. During the year, for example, one book on psychosomatic gynaecology and obstetrics and another on the emotional factors involved in gastrointestinal disorders were published. Pediatrics recognized more and more the importance of the psychiatric approach to the problems of illness in children. A study by A. E. Bennett showed that of nearly 4,800 general hospitals in the United States only about 280 had psychiatric facilities, and that only about 4% of all general hospital beds were for psychiatric cases. The trend was toward the development of psychiatric facilities in general hospitals, however, and represented a closer relationship between psychiatry and the rest of medicine.

Steps were taken by the American Psychiatric association to stimulate the development of higher standards in mental hospitals. Improvement, however, was largely dependent upon legislative appropriations, which in turn were dependent upon public interest and support. Work continued in studies on the genetic factors (that is, the inheritance of mental disorder), particularly with reference to the so-called manic-depressive psychosis. Studies indicated that hereditary factors are involved in this disorder.

The problem of the mental disorders accompanying old age continued to press urgently upon the public and upon mental hospitals. In New York state, for example, whereas in 1920 seven persons per 100,000 were admitted annually to the state hospitals with a diagnosis of senile psychosis, the number had risen 20 years later (1940) to 12, an increase of nearly 60%. There were many fields for research into the prevention of mental breakdown in later life, including physiologic, psychologic and social.

There were a number of developments in treatment of mental disease and deficiency. Follow-up studies were made on the permanency of the effects of glutamic acid on states of mental retardation. Unfortunately, glutamic acid does not offer a panacea, but it does appear that in some cases of prolonged treatment with this drug a substantial and permanent improvement may be observed. Considerable caution must still be advised in evaluating the effects, however.

Studies continued in the physiologic, as opposed to the psychologic, approach to treatment. In addition to insulin and electroconvulsive therapy, there were ACTH, cortisone, the steroids, histamine, carbon dioxide, intravenous ether, methedrine and a drug known as LSD 25. These substances were of varying efficiency and were indicated in only certain types of disorder. None of them is a cure-all, and in some instances the only effect, if any, is to make the patient more amenable to a psychotherapeutic approach. Studies on the effect of what is known as topectomy (that is, the removal of certain selected areas of the cortex of the brain) and upon the controversial subject of prefrontal lobotomy were pursued. Progress continued in the investigation of the effects of various drugs in lowering the intensity and frequency of convulsive seizures, and the possibility of developing further types of medication.

A study of 62 patients with anxiety neurosis, conducted from 2 to 12 years after they had completed a course of intensive individual psychotherapy, showed that nearly 60% had held their improvement, and that there was a close correlation between the evaluation of the patient's condition by the patient and by the doctor. The authors (Henry H. W. Miles, Edna L. Barrabee and Jacob E. Finesinger) stressed the importance of developing a methodology for further study of this important question. One of the most active fields in the therapeutic line during 1951 was that of group psychotherapy, a method started by Joseph H. Pratt in 1905 and developed by Louis Wender, Jacob L. Moreno, Samuel R. Slavson and others. Apparently there are some advantages to group psychotherapy over the individual variety, and its value was being shown not only in mental hospitals but in the treatment of alcoholics and in the re-education of offenders in penal institutions. This method must of course be used with discernment, and its limitations needed further study. (*See* also NERVOUS SYSTEM; PSYCHOLOGY; PSYCHOSOMATIC MEDICINE.)

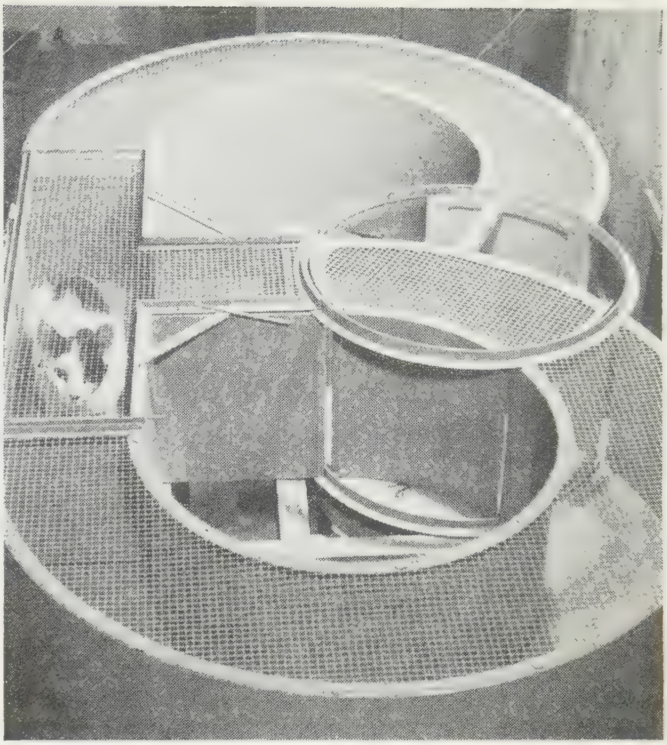
Psychology.

Many psychologists in 1951 continued to be concerned with problems of methodology. However, the emphasis shifted somewhat from the development of new techniques for the measurement and prediction of behaviour to the evaluation and refinement of techniques already in use.

E. Lowell Kelly and Donald W. Fiske published the results of a five-year research program, sponsored by the Veterans administration, on the prediction of performance in clinical psychology. The research was specifically designed to find efficient and accurate procedures for predicting whether a student would succeed as a clinical psychologist; but it had many implications for the selection of personnel in other professions. A large group of subjects was used, including all the students who entered the Veterans administration training program in clinical psychology in 1946 and 1947, and many psychologists with different backgrounds and theoretical orientations served as examiners, interviewers and observers. The study employed an extensive battery of psychological tests, intelligence tests, interest measures and so-called objective personality tests, as well as situation tests and projective tests, like the Rorschach ink-blot test. Various credentials often used in the selection of professional personnel, such as application blanks, were included. Because selection is often based on the impressions a candidate makes on an interviewer, this study also investigated how well an interviewer could predict later success in a professional position. After each student had gone through this complete assessment, an analysis was made in order to learn which of all these methods, or combinations of methods, yielded the best predictions of success.

One of the problems was, of course, to determine whether or not a student was successful. Consequently, follow-up studies were made at different stages of his training and, if possible, upon the completion of his training; and an attempt was made to measure how well he was performing his professional duties. In the past, psychologists spent much time in developing selection procedures, but they had relatively ineffective ways of deciding whether their procedures were valid, that is, whether they predicted actual performance on the job. The primary reason for this difficulty was that the measurements of job performance, especially of professional jobs, were inadequate. For example, if a medical student completed his medical school course, went into practice, and after that was favourably regarded by his patients and by other doctors, he was thought to be a good doctor. Although these criteria may be important indexes of professional success, they do not directly measure the individual's professional competence. Kelly and Fiske and their colleagues, by focusing attention on the theory of so-called criterion measures and on the development of procedures for obtaining these measures, appreciably advanced psychological work on the problems of selection.

The results of the study showed that both the objective tests and records and the clinical judgments and interviews were reasonably reliable and valid. An interesting and rather controversial finding was that the objective measures seemed to be better for predictive purposes than either the projective tests or the clinical judgments. Although much more work needed to be done before a final evaluation of these techniques could be attempted, this research cast some doubt on their value. A more specific result was that these psychologists found that they were better able to predict a general factor of success in the profession of clinical psychology than to predict success on any particular aspects of the duties involved. In general, this research not only advanced the solution of the problems of selecting and training clinical psychologists, but also, because of its scope and its inquiry into many types of psychological techniques, it was relevant and significant for the over-all problem of the selection of professional and other high-level personnel.



DOUBLE MAZE for testing cats' memories, used at Washington university, St. Louis, Mo., in 1951, to study the effects of anoxia (oxygen deficiency) just after birth on intelligence in maturity. About half of each litter tested had been subjected to anoxia after birth

The use of a theoretical or formal model led to a new approach to the study of language and communication. Beginning with an analysis of a communication system first made by telephone engineers, George A. Miller in his book, *Language and Communication,* described the process in the following way. Communication is thought of as a system in which information is passed from one person or place to another. The first component in the system is the source of information; *i.e.,* the person who is doing the talking or writing or other kind of communication. The next part is the transmitter, by which a message is encoded or put into a form in which it can be communicated. Speech, sign language, writing, etc., are all codes for sending a message. Next is the channel along which the message is sent in time or space. In speech the channel is the air which carries the sound waves to a listener's ear; in writing it may be a printed page. When the message is received, it must be decoded or put into its original form at its destination, and then the communication process is complete. In this system any errors that may arise are called noise. A perfect communication system would have no noise and the message would travel from its source to its destination without distortion. Emphasized in this approach is the fact that communication occurs in sequence, with one event following another in time or space. The order of these sequences is determined partly by the needs and desires of the communicating person and partly by the grammar, syntax and other characteristics of a language. By making sequential analyses of the statistical probabilities that one word or a series of words will follow another word or series of words, it may become possible to predict, at least on a short-term basis, the verbal behaviour of a human being.

In 1951 a publication of prime importance, the *Handbook of Experimental Psychology,* appeared. Although primarily of pedagogical interest, the book is significant in that it presents a technical survey, written by experts, of the field of experimental psychology at the middle of the 20th century.

In addition to the research and theoretical developments, psychology continued to undergo changes in its professional structure. The recent growth in the number of practising psychologists, as contrasted with those who do research or teaching, had led several states to enact laws concerning the practice of psychology. In some states certification laws were put into effect. Certification provides for the setting up of examination procedures or other means of establishing standards of performance, and the psychologist who goes through the steps necessary to show that he meets these standards is entitled to call himself a certified psychologist. Certification laws do not restrict the practice of psychologists who are not certified. Some states, on the other hand, passed licensing laws which limited the practice of psychology to those who could meet the qualifications to obtain a licence. Legislation had previously been enacted in Connecticut, Georgia, Kentucky, Oklahoma and Virginia; in 1951 two more states, Minnesota and Nevada, passed laws covering psychological practice. Psychosomatic Medicine.

A. E. Bennett and associates reported in Nov. 1951 that of 574,683 total beds in the 4,761 United States general hospitals, there were only 24,000 beds, or 4%, for psychiatric patients. These beds accommodated only 1% of all mental patients. Increasing appreciation of the role of emotional factors in many illnesses had made the general hospital the proper place in which to teach psychiatry and conduct research. Of 73 four-year medical schools in the United States in 1951, 52 used general hospitals for psychiatric teaching, training and research. Seventeen did not. Voluntary health insurance coverage of psychiatric disorders was seriously lacking. Only 10% of Blue Cross and 5% of Blue Shield plans that were studied provided the same benefits for psychiatric as for other medical disorders.

Approximately one-third of private practising psychiatrists had no hospital affiliation for treatment purposes. The restriction to office practice, together with the increasing public demand for psychiatric service, greatly handicapped both patient and physician.

Three hundred patients suffering from relatively early psychosomatic illnesses were studied by Marc Musser to determine the common and important bodily symptoms which correlated closely with the development of their emotional disorder—symptoms which might suggest the possibility of an underlying emotional disorder. All of the patients had thorough physical examinations and on no occasion was the influence of existing organic disease minimized. Persistent insomnia was present in 57% of the patients, and was often the earliest manifestation of emotional difficulty. In 30% of the patients who had recurrent headache, an emotional cause was rarely suspected initially. Many had received intensive treatment for chronic nasal sinusitis, allergic rhinitis, histamine cephalalgia and atypical migraine, and only after these approaches had failed was psychiatric investigation undertaken. Pain or aching in the muscles of the neck, back, chest or extremities was a prominent complaint in 43% of the patients.

These symptoms were some of the early bodily manifestations of emotional disturbances and often were the only indications of the psychosomatic nature of a patient's illness. Musser concluded that when these complaints are present, a thorough investigation of the life situations and personality of the patient is indicated.

Many gynaecological problems, previously investigated from a physical standpoint only, were shown by W. S. Kroger and S. C. Freed to have an important emotional component, for example, leukorrhoea, low back pain and sterility. New information was reported concerning emotional factors in menstrual dysfunctions and frigidity.

A book by Edward Weiss dealing with emotional factors in cardiovascular disease pointed out the great importance of these factors in producing symptoms generally attributed to heart disease, as well as in the precipitation and aggravation of actual organic disease of the heart. Public Health Engineering.

Development of water resources continued to be of major significance in virtually every country of the world during 1951. Shortage of the water supply of New York city during 1948–50 merely tended to dramatize a situation confronting small as well as large populations. The Water Resources Policy commission appointed by Pres. Harry S. Truman in Jan. 1950 proposed greater federal participation in the study and development of water resources—a participation not generally acceptable to many professional engineering groups.

The practice of water fluoridation continued to expand in 1951. By controlling the fluorine concentration of potable water, it had been found possible to reduce dental caries in children by 60% to 65% at a relatively low annual per capita cost of 5 to 15 cents. The National Research council of the United States reported that the administration of such a program presents no serious problem of public health or control. The practice was being given similar attention by the ministry of health of England. More than 6,000,000 people in the United States were using artificially fluoridated water in 1951, and 3,000,000 more were drinking water with a natural fluoride content sufficient to reduce dental caries.

Progress was made in studies on removal of radioactive contaminants from water, by coagulation with alum and sodium hydroxide and with other orthodox coagulants. The efficiencies of removal, however, depended upon the particular radioactive elements involved. With some, phosphate coagulation appeared particularly effective, as in the removal of mixed fission products and strontium 89.

A major development in equipment for water purification in England involved the use of finely divided woven fabrics of stainless steel as filtering media. The finest wires are about 0.0022 in. in diameter; the number of apertures per square inch in some of the fabrics is 80,000, with the apertures having a nominal size of about 35 microns. The fabric is used either for preliminary filtration of water or for the final clarification of sewage effluent from purification works.

EMPTYING SMOG BAGS at a California foundry in 1951, after smoke was sucked from the foundry's stacks and blown through filter bags to remove grit. The antismog machinery was installed by order of the Los Angeles County Air Pollution Control district

Insecticides.—The effectiveness of DDT apparently continued to decline in 1951. Flies were becoming more resistant not only to DDT but to other insecticides. Even Anopheles were not responding as effectively as before to DDT applications. Attention was directed to the development of alternative insecticides and the elimination of insect-breeding areas.

Laboratory studies confirmed the assumption that water wettable suspensions of DDT are vastly superior to emulsions of DDT on mud wall surfaces.

Animal-Borne Diseases.—The infectious diseases of animals constitute a considerable hazard to man. Food poisonings by Salmonella, Staphylococcus and Streptococcus had been attributed frequently to poultry. The turkey and the duck now played a new role in the engineering aspects of food control. A sound and inclusive poultry inspection service, under competent engineering and veterinary supervision, had become a major necessity for the protection of the health of the public. The characteristics of global rat populations were reviewed, with the general conclusion that to decrease the population, competition among rats should be fostered by decreasing food.

The results of increasing competition by manipulating the environment had been apparent in Baltimore, Md. In 1944, 400,000 rats were estimated to be living in Baltimore; in 1947 there were about 165,000 and in 1949 about 65,000. The reduction accomplished was of high engineering significance, because it was due primarily to the rehabilitation of substandard dwellings and to the simultaneous cleaning of dwellings. Public Relations.

While no truly reliable figures were available at the close of 1951, the best estimates were that about 35,000 persons were directly engaged in the practice of public relations in the United States. An estimated 6,500 employees of the federal government were performing public relations activities, 3,500 persons were in the employ of public relations counselling firms and the balance of about 25,000 were on the pay rolls of business, industrial, educational, charitable and other institutional organizations, and of state and municipal governments.

There were during the year at least 750 public relations counselling firms engaged in business in the United States, the great majority of them headquartered in New York city. As one index of the growth of the profession, only about half that many firms were in existence five years before. The larger of these firms had staffs ranging in size from 15 to more than 200 persons. A number received aggregate annual fees in excess of $500,000.

The United States civil service commission reported that in June 1951, 6,548 persons were working for executive departments and agencies of the federal government at information, editorial and public relations positions throughout the country. However, Sen. Homer Ferguson (R. Michigan) was reported by the *Chicago Daily News* to have stated that if all persons doing full or part-time "propaganda," direct and indirect, for the government were actually counted the total would be more than 60,000.

The bureau of the budget estimated that pay-roll costs for public relations personnel in the federal employ were $13,539,000 for the fiscal year 1949. While figures for later years were not available, there were good grounds to believe that pay-roll costs for this purpose had substantially increased by 1951.

Surveys of public relations trends in industry conducted by the Public Opinion Index for Industry of the Opinion Research corporation and by the National Research committee of the Public Relations Society of America disclosed sharply increased activity in the field during the year. In a review of concerns with assets of $5,000,000 and more, these were among the more significant disclosures:

Sixty companies out of 100 in a representative sample covering utilities and communications, trade, transportation and manufacturing had public relations departments. The department was headed by a vice-president in one company in five. About 70% of the persons in charge of public relations for their companies reported directly to the president or the chairman of the board. Size of public relations staffs varied from 1 person to 200, with a department of 10 to 15 persons being about average for large corporations. Approximately one-third of the companies surveyed reported an increase in staff during the year.

Public relations appropriations by industry continued to increase in 1951, with 38% of the corporations reporting an increase over the 1950 budget and only 8% reporting a decrease. The surveys further disclosed that 82% of the chief executives of corporations were taking an active part in the public relations efforts of their companies and that one-third of these officers were giving more time to public relations activities than they did five years before.

Other figures reported by the surveys and illustrating the increasing use of various tools of public relations included the following:

Employee publications were being produced by 76% of the companies in 1951 as against 57% in 1947. About 74% of the companies were sending regular letters to employees in 1951, whereas only 28% were regularly using this communications device five years previously.

In 1951, 79% of the large companies invited people in the community to visit their plants and learn about the companies at first hand. In 1948, only 26% of large companies had adopted this practice.

The use of newer information tools also showed marked uptrends. Comic books containing general company and economic information were used by 22% of the large corporations in 1951 as against 9% in 1949. Educational motion pictures were employed by 73% of the concerns in 1951 as against 48% one year previously. In 1951 about 17% of the surveyed corporations began using information racks for the easy and regular distribution of pamphlets and other printed materials.

Economics courses to which companies invited their foremen and other employees were offered by 20% of the companies in 1951 as against 12% in 1949.

Corporations were depending less on voluntary comment as a means of evaluation of public relations results and more on the more objective and scientific opinion survey. During the year 38% of the large companies made regular use of opinion surveys, while a year before only 20% did so.

At least 70 United States colleges and universities were offering courses in public relations and 6 were granting a bachelor's degree in the field.

The largest meeting in the history of the profession was held Nov. 18 to 21, 1951, in Chicago, Ill., with more than 500 delegates from all sections of the United States and from Canada, Venezuela and Puerto Rico attending the fourth annual conference of the Public Relations Society of America. (D. O'B.)

Public Utilities.

The first public utilities in the United States to feel inflationary effects in the past had been the urban transit utilities, followed shortly by the telephone utilities. Rate increases for these industries were justified in large part by the dominance of the labour factor in their operations. In 1951, however, the continuing and spreading effect of price and wage inflation began to affect also the retail rates of gas and electric utilities. The dockets of state regulatory commissions were bulging with applications from the gas and electric companies for rate increases, and commission orders were being issued granting them in whole or in part. The dominating argument for the advances was that, besides allowing for increases in the cost of labour and materials, the need for increases in depreciation rates and in the rate of return must also be recognized. The Office of Price Stabilization resisted these rate advances with the plea that their effect upon the economy, if granted, would be inflationary. The commissions justified their orders by contending that some increases were necessary to protect the credit of the companies at a time when large issues of equity securities had become necessary to provide the capital for plant expansion. A significant new note in these arguments was the contention by the utilities that depreciation as a current cost should be based upon the current high cost of replacement of physical property instead of the lower actual costs of the past.

Another important development for public utility industries was the construction for the Atomic Energy commission at Paducah, Ky., of a new plant which would require 1,000,000 kw. of electric power. Early in the year, agreements were reached that half of these energy requirements would come from TVA and half from Electric Energy, Inc., a new company formed jointly by five private electric utilities operating in the vicinity. The importance of this new development was signified by the fact that to construct a new steam-electric plant, the new company was authorized to sell $100,000,000 in bonds to two insurance companies

Judicial Decisions.—Since World War II a growing number of states had passed legislation restricting the right of public utility employees to strike against their employers. Among them a Wisconsin statute provided that where the collective bargaining process reaches an impasse or stalemate and the state labour relations board finds that the dispute, if not settled, may cause interruption of an "essential service," and where such interruption results in damage and injury to the public, a process of conciliation followed by compulsory arbitration be instituted. A union of motor coach employees, being unable to agree upon new terms for wages with its employer, the Milwaukee Electric Railway and Transport company, had called a strike to enforce its demands. The Wisconsin employment relations board immediately secured a court order restraining the strike. This order was affirmed on appeal by the supreme court of Wisconsin. The union appealed the Wisconsin decision to the United States supreme court which overthrew the state anti-strike law (340 U.S. 874). The court found that the procedure required by the Wisconsin law was in conflict with the procedure required under the federal Taft-Hartley act in which congress had expressly safeguarded the right of employees to engage in concerted activities for the purpose of collective bargaining, including the right to strike. Since congress, in restricting employees' rights in cases involving national emergencies, had not gone to the length of prohibiting strikes, such greater restrictions were prohibited to the states in their legislation.

In *Cities Service Gas Co.* v. *Peerless Oil and Gas Co.* (340 U.S. 179), the supreme court for the first time sustained the fixing of a minimum price for natural gas as a reasonable regulation in the interest of conservation. The Oklahoma commission had fixed the minimum wellhead price in the Guyman-Hugoton field and had ordered the Cities Service company to take gas ratably from the Peerless company at such minimum price. The court sustained this order.

As clearing the way for state commissions to direct natural gas toward uses deemed by them to be conservationally most important, the federal supreme court sustained (341 U.S. 329) an order of the Michigan commission directing the Panhandle

Eastern Pipe Line company to secure a certificate of public convenience and necessity before selling gas to industrial consumers in the service area of a local gas company. The court held that although such sales were in interstate commerce, congress in passing the Natural Gas act had left them to regulation by the states as matters of essentially local concern.

Another commission decision, in this case of the Federal Power commission, had long-run implications upon the conservation issue. In the Phillips Petroleum case, decided Aug. 22, 1951, a divided commission held that transportation and sale of gas in interstate commerce is not within its jurisdiction if made in the course of production and gathering. This case appeared certain to be appealed to the supreme court.

Legislation.—Florida joined the ranks of the states subjecting its privately-owned gas and electric utilities to a comprehensive system of regulation administered by a state Railroad and Public Utilities commission. In other states, besides the usual grist of laws making minor amendments in existing regulations, changing names, length of tenure of commissioners and size of commission, there appeared a distinct trend to subject both electric and telephone co-operatives to commission jurisdiction.

When congress in 1951, despite executive pressure, failed to advance the Great Lakes-St. Lawrence seaway and power project, the Canadian parliament on Dec. 19 approved legislation to authorize the construction of the St. Lawrence waterway project by Canada alone. Previously, parliament had endorsed a measure approving an agreement between the federal government and the province of Ontario whereby the latter would take over the power project in the international rapids section. With the expectation of forestalling the Canadian plan of unilateral action, which would involve the payment of tolls by U.S. shipping using the waterway and which would have serious drawbacks for the U.S. in other respects, the president, in his budget message, again asked the approval of congress for the joint project by including a $20,000,000 supplemental appropriation for fiscal 1953 to the army engineers for the beginning of construction. According to latest estimates, the comprehensive plan would cost about $600,000,000, with a power capacity of 940,000 kw. The controversial seaway part of the project was defended upon the new ground that an inland and submarine-proof route was advisable for reasons of national security, and to bring iron ore cheaply from Labrador to the steel mills of the middle west.

The Electrical Industry.—The year 1951 carried both production and sales of electric power to hitherto unheard-of totals. Compared with 1944, the peak war year, 1951 showed a boost in energy production from 228,000,000 kw.hr. to 371,000,000 kw.hr. and sales from 198,000,000 kw.hr. to 317,000,000 kw.hr. In the same period, capacity rose from 49,000,000 kw. to 75,000,000 kw. (*See* also DAMS; ELECTRICAL INDUSTRIES; FEDERAL POWER COMMISSION; LAW; RAILROADS; RURAL ELECTRIFICATION; TELEGRAPHY; TELEPHONE; TENNESSEE VALLEY AUTHORITY; ELECTRIC TRANSPORTATION.) (M. G. G.)

Canada.—Pressures on such public utilities as those filling the transit, electric power, telephone communication and fuel gas needs of the public continued and even increased throughout 1951. The increase was, in general, a result of the expanding population, but in particular it could be traced to the improving standard of living and to the growing tendency of the population to concentrate in cities. The latter meant, for instance, that transit companies needed more vehicles and that the vehicles had to travel longer distances (into spreading suburban areas) to maintain scheduled routes.

Despite the competition of bottled gas, consumption of natural gas soared (1949: 60,457,177,000 cu.ft.; 1950: 85,128,691,000 cu.ft.). Five companies sought the right to export from Alberta. The U.S. Federal Power commission refused permission to Texas natural gas interests to export about 10,000,000,000 cu.ft. per year to Ontario areas.

Despite intense programs for expanding telephone service in 1951, waiting lists of persons wanting phones continued to embarrass even the larger companies, though there were 40% more phones than in 1946. During the year the major companies spent more than $100,000,000 for new installations, exchanges, toll lines, and to help finance them were granted rate increases running from 5% to 12%. (C. CY.)

Puerto Rico. A United States insular dependency in the West Indies, Puerto Rico has an area of 3,435 sq.mi. Pop. (1950 census) 2,210,703. Rural population was estimated at 59.5% of the total, urban population 40.5%. Chief cities (with April 1, 1950, preliminary census figures): San Juan, the capital (223,949); Río Piedras (132,369); Ponce (99,190); Mayagüez (58,744); Caguas (33,733); Arecibo (28,500). Languages: Spanish and English. Religion: predominantly Roman Catholic. Governor in 1951: Luis Muñoz Marín.

History.—In the process of carrying out the objectives of public act 600 of the U.S. congress, which recognizes the right of the people of Puerto Rico to organize a government pursuant to a constitution of their own adoption, a referendum was held on June 4, 1951, to accept or reject public act 600. The people of Puerto Rico, by a great majority, accepted public act 600. On Aug. 27, 1951, elections were held to select the delegates to the constituent assembly. On Sept. 17, 1951, the inaugural session of the constituent assembly was held. Antonio Fernós Isern, resident commissioner of Puerto Rico in Washington, D.C., was selected president.

On June 4, 1951, and through a process of referendum, the municipality of Río Piedras was annexed to the municipality of San Juan, giving the capital a population of 356,318 inhabitants.

Education.—Total enrolment during 1951 in the public and private schools of Puerto Rico was 482,319. Public schools had an enrolment of 458,793 pupils; private schools 23,526. Enrolment in the public schools was distributed as follows: 340,047 in elementary schools; 99,640 in secondary schools; 6,522 in vocational schools; and 12,584 in evening schools. In the public schools, the number of teachers, principals and assistant superintendents was 9,691; private schools employed 1,045 teachers. Higher education was carried on by the University of Puerto Rico, Río Piedras, the Polytechnic Institute of Puerto Rico, San Germán, the College of Sacred Heart, Santurce, the University of Saint Mary and the Puerto Rico Junior college.

The estimated total school-age population (persons 6 to 18 years old) in Puerto Rico in 1951 was 706,289. Of this number, 454,866, or 64.4%, were enrolled in the public and private schools of the island.

Banking and Finance.—Total bank deposits as of June 30, 1951, amounted to $281,717,419; bank debits were $311,983,565; bank loans amounted to $154,307,893.

Insular government revenues and receipts for the fiscal year (ending June 30) 1950–51 totalled $229,031,436 of which $134,571,845 was received in the general fund and $94,459,591 in all other funds. The total disbursements, excluding transfer payments, for the same period amounted to $226,927.333. Of this total, disbursements from the general fund amounted to $132,886,499 and from all other funds $94,040,834.

Trade.—For the fiscal year (ending June 30) 1950–51, the value of shipments of goods and merchandise from the United States to Puerto Rico was $400,397,676. The value of imports from foreign countries for the same period was $37,137,930. The total value of goods and merchandise entering Puerto Rico was $437,535,606, of which 91.5% came from the United States and 8.5% from foreign countries. During the fiscal year, the value of shipments from Puerto Rico to the United States was $254,337,842 and the value of exports to foreign countries was $17,076,076.

Communications.—During the fiscal year (ending June 30) 1950–51, 70,755 motor vehicles were registered, of which 45,063 were passenger vehicles, excluding government owned vehicles; 9,529 were heavy trucks; 9,938 were light trucks; and 6,225 were other vehicles such as tractors, trailers, motorcycles, etc., and government-owned vehicles. The insular department of the interior kept under maintenance, as of June 30, 1951, 3,693 km. of roads. During the fiscal year, 2,723 vessels entered insular ports with a registered tonnage of 10,385,860 short tons. During the same period, 146,978 passengers arrived at the island, 139.524 by air and 7,454 by water. A total of 188.898 passengers departed from the island, 183,300 by air and 5.598 by water. As of June 30, 1951, there were 37,066 telephones in service in the island. As of Aug. 1951, 24 radio stations were operating.

Agriculture.—During the 1951 crop year, 10,501,396 short tons of

PUERTO RICAN WOMEN finishing custom-made carpeting at a new factory near Carolina, P.R., in 1951. They are shown applying dyed wool yarn to the backing fabric premarked for design

sugar cane were harvested in Puerto Rico. The coffee crop amounted to 172,000 cwt.

Manufacture.—Sugar production for the 1951 crop year amounted to 1,201,310 short tons of raw sugar (96° basis), and 207,055 short tons of refined sugar (96° basis). The total production during fiscal year (ending June 30) 1950–51 of some manufactured products was as follows: distilled spirits, 4,598,911 proof gallons; beer 3,495,397 gal.; blackstrap molasses 60,407,525 gal.

During the year, the total value of building permits granted was $97,487,564. There were 6,530 building permits granted, and 10,563 new dwelling units authorized. Electric power generated for the same period amounted to 610,973,362 kw.hr. (J. L-Ee.)

Mineral Production.—The accompanying table shows the tonnage and value of mineral production in the territory in 1949 for commodities having values in excess of $100,000, and corresponding data for 1950, so far as they were available at the close of 1951.

Mineral Production of Puerto Ric

(Short tons)

Mineral	1950		1949	
	Quantity	Value	Quantity	Value
Cement	3,187,451	$8,299,186	2,171,486	$6,109,041
Lime	8,166	180,828	7,347	184,618
Stone	250,010	574,709	519,870	826,621
Other Minerals		?		244,699
Total		?		$7,365,000

Pulitzer Prizes.

The annual Pulitzer prizes in journalism, letters and music, first awarded in 1917, were established at Columbia university by the will of Joseph Pulitzer. The four 1951 prizes in letters, of $500 each, were awarded as follows: fiction award to Conrad Richter for *The Town* (Knopf); biography award to Margaret L. Coit for *John C. Calhoun, American Portrait* (Houghton); history award to R. Carlyle Buley for *The Old Northwest; Pioneer Period, 1815–1840* (Indiana Historical Society); poetry award to Carl Sandburg for *Complete Poems* (Harcourt Brace). No drama award was given for 1951.

Twelve prizes in journalism were awarded; they consisted of $500 each to the individuals, and gold medals to the two newspapers cited. Six foreign correspondents received awards in international reporting, marking the first time that more than one award had been given in this field. No award was made in the field of national reporting. The journalism prizes were awarded as follows: for meritorious public service, to the *Miami Herald* for crime reporting exposing gangster infiltration into Miami daily life and to the *Brooklyn Eagle* for its series on gambling and police corruption in Brooklyn; for local reporting, to Edward S. Montgomery of the *San Francisco Examiner* for his series of articles which resulted in an expose within the bureau of internal revenue; for international reporting, to Fred Sparks of the *Chicago Daily News* for his story from Berlin concerning the training of a new Nazi army by the Communists; and to Homer Bigart and Marguerite Higgins of the *New York Herald Tribune,* Keyes Beech of the *Chicago Daily News,* Relman Morin and Don Whitehead of the Associated Press for their reporting of the Korean fighting; for distinguished editorial writing, to William H. Fitzpatrick of the *New Orleans States* for a series of editorials on the United Nations Genocide Covenant and Covenant on Human Rights; to Reginald W. Manning of the *Arizona Republic* (Phoenix) for his cartoon "Hats"; to Max Desfor of the Associated Press for his photographic coverage of the Kòrean fighting, as typified in his "Flight of Refugees Across Wrecked Bridge in Korea."

The Pulitzer prize in music, first given in 1943, was awarded to Douglas Stuart Moore for his score of the opera *Giants in the Earth.* (R. E. Bs.)

Quebec.

The largest Canadian province, Quebec is located along the lower St. Lawrence river. Area: 594,860 sq.mi., of which 71,000 sq.mi. are water. Pop. (1951 census): 4,055,681. Capital: Quebec city (pop. 1951) 161,439, metropolitan area 271,236; chief city: Montreal (*q.v.*) 1,002,703, metropolitan area 1,370,044.

History.—The third session of the 23rd legislature concluded in March 1951 (having started in Nov. 1950) with 67 government and 83 private bills sanctioned by the lieutenant governor. The government was authorized to make large expenditures on new hydroelectric projects, highways, and agricultural and housing assistance. The fourth session of the legislature convened early in Nov. 1951 to provide enabling legislation for Quebec's participation in the federal old-age security scheme (*see* Social Security). Provincial rent control took over from the former federal rental body.

Extremely buoyant economic conditions prevailed throughout the year.

Education.—In the 1945–51 period, 1,385 new schools were built in the province and 7,547 existing schools were improved.

Finance.—The 1951–52 provincial figures (with 1950–51 in parentheses) were: revenues $237,771,000 ($231,985,000), ordinary expenditures $173,697,200 ($149,952,860), capital expenditures $44,150,700 ($31,015,000), debt charges $18,879,000 ($19,647,000).

Transportation.—The 1951 provincial expenditure on roads ran to $62,000,000, compared with $42,000,000 in 1950. Increased traffic led to inauguration of a policy of keeping 90% of the 6,730 mi. of first-class highways open during the winter months. An 80-mi. cutoff across Gaspé was practically open, which saved encircling the entire peninsula. The year saw completion of about 40 mi. of the 350-mi. railway from Sept Iles to the northern Quebec-Labrador iron ore discoveries.

Agriculture and Fisheries.—Crops for the year were given an estimated value of $205,000,000 and livestock of $312,000,000. In 1951 6,339,400 ac. were under cultivation.

Production of fish for the first nine months of 1951 (with production for the comparable period of 1950 in parentheses) was: landings of 85,933,000 lb. (101,580,000 lb.) which brought $2,584,000 ($2,631,000).

Industry.—Pulp and paper production for 1951 was set at $400,000,000, while lumbering for the year did not exceed $100,000,000.

The 8,700 manufactories of 1941 had nearly doubled in number by 1951, and production totalled about $4,500,000,000. Early in 1951 the premier announced that in the 1951–53 period public and private interests would spend another $1,500,000,000 on hydro expansion.

Minerals.—The total value of minerals for 1951 was officially estimated

FRIGHTENED ORPHANS, their hands still linked, making their way to safety after filing down the single fire escape of the Hospice Ste. Cunegonde in Montreal, Que. The Catholic refuge for orphans and the aged went up in flames in June 1951, taking the lives of 35 adults

at $240,000,000. More than 600,000,000 tons of iron ore were blocked out in the Ungava area, and work on the railroad, town site and hydroelectric plants went forward. Mining was expected to begin in 1954. About $15,000,000 was authorized for development of the copper deposits in Gaspé. The north-shore titanium deposits were being exploited for an expected 110,000-ton yield by 1952. The Barraute silver-zinc find was further outlined, and completion of the highway into the Chibougamau area brought the announcement of existence there of an $80,000,000 copper-gold ore reserve. (C. Cy.)

Radio.

The number of radio stations in operation or being constructed throughout the world in 1951 did not change substantially, according to the best available estimates. These placed the total at about 6,750, counting booster or relay as well as broadcast stations but excluding television (TV) and frequency modulation (FM) stations.

Unofficial estimates indicated that the number of radio receiving sets in use throughout the world increased by about 5,000,000 to 9,000,000, to reach a total of 171,000,000 to 175,000,000. Most of these were on the North American continent. The U.S. total alone was placed at about 104,000,000, compared with an estimated 90,000,000 in 1950.

U.S. Stations.—The year 1951 was one of steady but unspectacular growth in the broadcasting field. There was a net gain of 87 amplitude modulation (AM) stations during the year. In FM, however, which had never really caught on with the public despite early enthusiasm of broadcasters, the number of stations showed another decline in 1951.

The box score kept by *Broadcasting Telecasting Magazine* from official records of the Federal Communications commission (FCC) showed that 3,161 broadcasting stations—AM, FM and TV—were in operation or had been authorized by the end of Dec. 1951. This figure represented a net gain of 57 over the 3,104 reported at the end of 1950, whereas the 1950 total represented a net loss of 34 as compared with 1949. The number of stations actually on the air at the end of 1951 was the largest in history: 3,083, compared with 3,014 the previous year.

The *Broadcasting Telecasting Magazine* box score placed the AM stations total at 2,406, of which 2,295 were in operation. A year earlier, at the end of 1950, the box score showed 2,319 AM authorizations, with 2,231 of this number in operation. The FM station authorization total dropped from 676 to 648; but, as had been the case in 1950, all of the authorized stations were on the air.

In television, the FCC's licensing freeze was still in effect—though the communications agency gave hope of lifting it early in 1952—and the number of TV station authorizations again, for the third year, did not gain. Indeed, in August, through the effectuation of a previously issued FCC order, an authorization for a TV station in Jacksonville, Fla., was deleted and the total number of authorizations dropped from 109 to 108. The number of stations in operation increased, however, from 107 to the full 108, and the number serving U.S. citizens reached 109, counting a new station at Matamoros, Mex., across the border from Brownsville, Tex.

Applications for new AM stations awaiting FCC action numbered 310 in Dec. 1951, compared with 263 a year earlier. In FM, 11 applications were pending compared with 10 in 1950. In TV, the 1950 year-end total of 374 grew to 475 during 1951 and the number was still increasing as a result of the FCC's indications that it would soon lift the licensing freeze.

Facsimile.—There was little activity in the facsimile field in 1951. Approximately a dozen FM stations, most of them owned by newspapers, were engaged in this method of record transmission and reproduction—about the same number as in 1950. Technical standards called for an 8.2-in. paper size, with speeds permitting transmission at a rate of 16 letter-size pages per hour.

Transit Radio.—One of the major developments in FM—"transit radio," or the transmission of special programs (usually music and news) to receivers installed on streetcars and buses, which had become a sizeable operation in many cities—was facing a supreme court test at the close of the year. The supreme court agreed in October to hear an appeal from a District of Columbia court's decision, in a case brought by a group opposed to what they called "forced listening," which held that transit radio "commercials and announcements" were unconstitutional in that they "deprive objecting passengers of liberty without due process of law." The high court, which was expected to hear the case early in 1952, also agreed to consider whether transit radio music and noncommercial announcements, such as weather reports and other public service features, are legal or illegal.

The outcome of this case, it was felt in radio circles, might also have implications for other FM specialized services, such as broadcasting programs for reception in stores, factories, restaurants, etc.

U.S. Commercial Broadcasting.—The year 1950, latest for which official reports were available at the close of 1951, brought a reversal of the downward trend in net revenues which sharply mounting expenses had produced in immediately preceding years. Instead of taking a 12.21% drop in net income before federal taxes, as they did in 1949, AM networks and stations enjoyed a gain of approximately 25.7% as their total rose to $70,743,262 as compared with $56,262,915 in the preceding year, according to official figures compiled and released by the Federal Communications commission.

Gross revenues registered a 7.1% gain, reaching $443,057,845. This compared with $413,784,633 in 1949, which represented a 1.67% increase over 1948.

The FCC report placed total broadcast expenses for 1950 at $372,314,583, up 4.1% from the 1949 figure of $357,521,718. The report was based on information filed by 7 AM networks, their 26 owned and operated stations, and 2,117 other AM stations in 1950, and by 7 networks, 28 owned stations, and 1,993 others in 1949.

The 4 national AM networks and their 18 owned AM stations accounted for $106,037,156 of total broadcast revenues in 1950, while 3 regional networks and their 8 owned stations accounted for $4,441,302, and the 2,117 other stations accounted for $332,579,387. The preceding year, the three classifications reported $105,287,561, $4,153,648, and $304,343,424, respectively.

In net income before federal taxes, the nation-wide networks and their owned stations reported $18,662,605 compared with $18,498,708 in 1949; the three regional networks and their owned stations, $321,737 in 1950 as against a loss of $593,632 in 1949; and the 2,117 other stations, $51,758,920, compared with $38,357,839 reported by 1,993 in 1949.

Receipts from the Sale of Time.—Time sales, which represent the financial backbone of broadcasting, climbed to a new high mark in 1950 with an increase of approximately 6.6% over the previous year, the FCC report showed. The 6.6% gain put the 1950 total at $453,564,930, as against 1949's $425,357,133, which had represented a 2.07% increase over the 1948 totals. Revenues from the sale of network time totalled $131,530,216, compared with $134,898,325 in 1949; time sales to national and regional advertisers amounted to $118,823,880 ($108,314,507 in 1949); and time sales to local advertisers totalled $203,210,834 ($182,144,301 in 1949).

These totals included commissions paid to agencies, etc., which broadcasters regard as an expense of sale. Commissions and payments of this nature totalled $52,475,775, whereas in 1949 the comparable total was $50,307,683.

AM Industry Balance Sheet.—A comparison of fundamental financial data for the years 1950 and 1949 is shown in Table I, prepared on the basis of FCC records.

Table I.—*Financial Status of AM Broadcasting Industry in U.S.*

AM networks and stations	1950*	1949†	Per cent increase (decrease in parentheses)
Revenues, sale of network time . . .	$131,530,216	$134,898,325	(2.5)
Revenues, time sales to national, regional advertisers	118,823,880	108,314,507	9.7
Revenues, time sales to local advertisers	203,210,834	182,144,301	11.6
Commissions to agencies, etc.	52,475,775	50,307,683	4.3
Revenues from talent sales, etc. . . .	41,968,690	38,735,183	8.3
Total broadcast revenues	443,057,845	413,784,633	7.1
Total broadcast expenses	372,314,583	357,521,718	4.1
Broadcast income (before federal income taxes)	70,743,262	56,262,915	25.7

*Seven networks, 2,143 stations covered in report.

†Seven networks, 2,021 stations covered in report.

Tangible Broadcast Property.—Seven AM networks, their 26 owned stations, and 2,108 other AM stations had a total original investment of $242,397,350 in tangible broadcast property, according to the FCC report for 1950. This total was broken down as follows: 4 nation-wide networks and 18 owned stations, $28,431,206 (compared with $25,499,895 in 1949); 3 regional networks and 8 stations, $1,662,737 ($4,930,738 in 1949); and 2,108 other stations, $212,303,407 ($200,156,402 for 1,997 stations in 1949). Total depreciated cost of these properties: $149,413,180. By category, the depreciated costs were listed as follows: 4 national networks and 18 stations, $12,369,293 ($10,-

PAMELA BROWN (left), John Gielgud and Dorothy McGuire rehearsing for their 90-min. performance of *Hamlet* in 1951. They were presented by the Theatre Guild on the Air, chosen the outstanding dramatic program of the year by the Academy of Radio and Television Arts and Sciences

513,660 in 1949); 3 regional networks and 8 stations, $461,794 ($3,234,150 in 1949); and for 2,108 other AM stations, $136,582,093 ($136,326,482 for 1,997 stations in 1949).

Table II.—*AM Tangible Broadcast Property in the U.S.**

	1950	1949	Per cent increase (decrease in parentheses)
Original cost	$242,397,350	$230,587,035	5.1
Depreciation to date	92,984,170	80,512,743	15.4
Depreciated cost	149,413,180	150,074,292	(0.44)

*1949 figures represent 4 national networks and 18 owned stations, 3 regional networks and 8 stations and 1,997 other stations. 1950 figures represent 4 national networks and 18 stations, 3 regional networks and 8 stations and 2,108 other stations.

FM Finances.—There was no way of counting FM revenues and expenses accurately, principally because many FM stations were operated by AM broadcasters and often in these cases there was no clear distinction between the financial records, especially the expense data, for the two stations. It was generally accepted, however, that FM's income was still comparatively small. In many instances, joint AM-FM stations offered the FM audience as a bonus with the AM.

Estimated 1951 Time Sales.—Official figures on radio time sales in 1951 were not available, but *Broadcasting Telecasting Magazine* placed the 1951 total at approximately $485,492,606. This represented a gain of almost $32,000,000 over the $453,564,930 recorded in 1950. A comparison of the 1951 estimates with the 1950 totals computed by the FCC is provided in Table III.

Table III.—*Time Sales of U.S. Radio Stations*

Class of business	1951 (estimated)	1950	Per cent increase (decrease in parentheses)
National network	$116,641,381	$124,633,089	(6.4)
Regional and miscellaneous network	7,125,000	6,897,127	3.3
National and regional non-network	134,291,439	118,823,880	13.1
Local	227,434,786	203,210,834	11.4
Total	$485,492,606	$453,564,930	7.1

Source: 1952 *Radio Yearbook of Broadcasting Telecasting Magazine.*

U.S. Manufacturing.—The Radio-Television Manufacturers association, which represented more than 80% of the industry, in a preliminary estimate in December placed 1951 production at approximately the following levels: home radio receivers, 6,700,000; automobile radios, 4,500,000; portable radios, 1,300,000.

Although the outlook for 1952 indicated further limitations on civilian production, primarily because of material shortages, officials of the association expected a faster pace of deliveries of military electronic equipment. This, they felt, would increase employment and take up much of the plant capacity which had been idle for a period in mid-1951.

U.S. Programs.—The most popular radio network programs during the third week of November in 1951 as compared with the same week in 1950 are shown in Tables IV and V. The tables segregate the programs between daytime and nighttime.

Table IV.—*Top Rated Nighttime AM Network Programs in the U.S.*

Program	Rank Nov. 1951	Rank Nov. 1950	Nielsen rating Nov. 1951	Nielsen rating Nov. 1950
Radio Theatre	1	1	16.3	20.9

ARMED GUARD at the studios of Radio Free Europe in western Germany, a private U.S. enterprise for broadcasting to soviet satellite nations. It was given the 1951 George Foster Peabody award for its "contribution to international understanding"

The year 1951 was marked by much experimentation with new radio programs, as broadcasters sought to develop shows that would better meet or offset television competition. A. C. Nielsen Co. measurements indicated that, among early fall programs, comedy variety radio shows—which had been tied with general drama for first place in 1950—had dropped to fifth place in 1951. News interest remained at a high level, because of the Korean war and general world conditions.

U.S. Nation-Wide Networks.—The number of U.S. national radio networks, which had increased from four to six in 1950, dropped back to five in 1951 when the Progressive Broadcasting system suspended operations on Feb. 1, less than three months after it started. The four veteran radio networks were the American Broadcasting company (ABC), the Columbia Broadcasting system (CBS), the Mutual Broadcasting system (MBS) and the National Broadcasting company (NBC). The latter

TINY TRANSISTOR developed at the Bell Telephone laboratories, New York city, in 1951 (compare size with peas in open pod). It amplified electrical signals about 100,000 times and required only one-millionth of the power needed by the miniature vacuum tube

celebrated its 25th anniversary (Nov. 15) with special programs throughout the last half of the year. The youngest national network, the Liberty Broadcasting system (LBS), which had started full-time service on Oct. 2, 1950, claimed by the end of 1951 to have 430 stations affiliated with it.

A change in ownership of ABC loomed at the end of 1951 as result of an agreement reached in May whereby ABC would be merged with United Paramount Theatres, Inc., a major motion picture theatre company, in a $25,000,000 deal. The FCC, whose approval was required because ABC was a station licensee, scheduled a hearing for early 1952.

In another major development, CBS entered the manufacturing field on a substantial scale by acquiring, through a $20,000,000 exchange-of-stock arrangement consummated June 15, the properties of Hytron Radio and Electronics Corp., manufacturers of radio and television tubes and receiving sets, phonographs, and radio and TV cabinets. As a corollary, and also in recognition of increasing competition between radio and TV broadcasting activities, CBS a few weeks later reorganized into six autonomous units, including separate divisions for operation of its radio and television networks.

The possibility of future changes of significance in the ownership and perhaps in the type of network operation of the Mutual Broadcasting system developed in October, when plans were announced for a merger of WOR and WOR-TV (New York city) with the radio and television properties of General Tire and Rubber Co., which included two regional networks (the Yankee network in New England and the Don Lee Broadcasting system on the west coast). Both WOR and General Tire owned blocks of Mutual stock which combined would form clear majority control of the network for the first time. Under the plan, which was awaiting FCC action when 1951 ended, General Tire or a subsidiary would be in control.

U.S. Organizations; Regulation.—A series of executive changes, and a change in name, were executed by the broadcasters' trade association, the National Association of Broadcasters (NAB). Taking cognizance of television's growing importance as a broadcast medium, NAB in April changed its name to National Association of Radio and Television Broadcasters (NARTB). A few weeks later, at its annual convention, held in Chicago, Ill., NARTB advanced Pres. Justin Miller to the office of board chairman and general counsel and installed Harold E. Fellows of WEEI, Boston, Mass., as NARTB president.

In the meantime, William B. Ryan had left the NAB general managership which he assumed in 1950 and became president of NAB's semiautonomous sales promotion agency, the Broadcast Advertising bureau, which was scheduled to receive independent status in 1952.

In other radio-TV trade organizations, Glen McDaniel, a vice-president of Radio Corporation of America, was elected first paid president of the Radio-Television Manufacturers association (RTMA) and took office on April 1, and Murray Grabhorn, a former network executive, on July 1 became managing director of the National Association of Radio and Television Station Representatives (NARTSR), an organization of advertising sales representatives for radio and TV stations.

Broadcast Music Inc. (BMI), licensing and publishing organization established and supported by the broadcasting industry, expanded its activities during 1951 with several new major projects under the direction of Pres. Carl Haverlin and reported in December that the year 1951 had been one of the best in its 11-year history.

Regulation.—In the over-all field of radio and wire communications regulation, Pres. Harry S. Truman's temporary Communications Policy board, set up in Feb. 1950 to seek ways of achieving economy in the use of frequencies, submitted a voluminous report in Feb. 1951. Implementing it five months later, President Truman appointed Haraden Pratt, a vice-president of American Cable and Radio Corp., as his telecommunications adviser, with responsibility for formulating national policy on both national and international frequency allocations. Broadcasters derived much hope from the appointment, for they thought it might lead to restoration of a number of scarce frequency bands which they felt were being withheld from them unjustifiably by various government radio operations.

In the area of private broadcasting, the FCC in March handed down its decision on its proposal to adopt a uniform policy to be applied in all cases where applicants or licensees had violated laws (primarily the antitrust laws) other than those dealing specifically with broadcasting. In its decision, the commission held that it had authority to consider such violations as an aid in determining an applicant's character qualifications, but that it would do so on a case-by-case rather than on a uniform basis.

In Nov. 1951, on the eve of a presidential election year—always a troublesome time for broadcasters, who regularly face heavy demands for political broadcast time but who must operate within strict legal requirements to ensure equal opportunity for all rival candidates—the FCC served new notice that it would not tolerate censorship of radio political speeches, even if libel or slander were involved. Broadcasters had pleaded that if they permitted political speakers to broadcast slanderous material, then the stations would be subject to prosecution under state libel or slander laws. FCC took the position that its "no censorship" edict, since it stemmed from a federal ban on censorship in general, would in effect supersede state laws. The commission conceded that the apparent conflict in laws created uncertainty, but held, in its November ruling, that "hereafter we will not accept the plea of doubt and uncertainty in the state of the law as a reason for not administering the law as we read it."

At the congressional level, Sen. William Benton, Democrat, of Connecticut, stirred up a controversy which reverberated throughout the broadcasting industry by introducing a bill to create a national citizens advisory board on radio and television. The proposed board would review and report on the operation of radio and television in terms of the public interest. The plan was attacked by broadcasters and some government officials as raising dangers of censorship; by others it was defended as a wise and legal step to improve radio and television as mediums for enlightening, educating and improving the public. It had not been acted upon finally when congress adjourned, but remained available for action when the second session convened in Jan. 1952.

Inter-American Agreements.—The new North American Regional Broadcasting agreement (N.A.R.B.A.), developed and signed in late 1950 after much controversy, remained a subject of intermittent dispute in 1951, when it came up for ratification by the U.S. senate. The agreement, replacing an earlier one which had expired, was intended to govern AM broadcast allocations among the U.S., Canada, Cuba, the Bahamas and Jamaica and the Dominican Republic, but its critics contended it made too many concessions to some of the other countries, especially Cuba. The senate foreign relations committee assigned a subcommittee to study it, but no further action was taken during the 1951 session. (R. W. Cr.; S. Tf.)

Great Britain.—The report of the Beveridge committee, published in Jan. 1951, recommended that the British Broadcasting corporation should remain responsible for all British broadcasting, including television. Severe interference with the reception of the British domestic services resulted from the Copenhagen plan of 1950 realloting medium wave lengths. Steps were, however, taken to assist listeners in the areas most seriously affected by erecting a number of low-power transmitters, several of which were in service by the end of 1951. A plan for a nationwide service on very high frequencies was submitted by the B.B.C. to the general post office. Improvement in the reception of the Light program was effected when the power of the long-wave transmitter (1,500 m.) at Droitwich was increased to 400 kw. Third program coverage was improved by the opening in April of a new high-power transmitter at Daventry on a wavelength of 464 m.

The Festival of Britain played a large part in B.B.C. programs. The Home service presented a special series of plays and symphony concerts as a contribution to Festival year. Outside broadcasts gave extensive coverage to the Festival and, with the Canadian Broadcasting company, to the royal tour of Canada. The Reith lectures, on "Power and the State," were given by Lord Radcliffe of Werneth. Bertrand Russell gave six weekly talks on "Living in an Atomic Age." In the Light program the high light was the "Festival of Variety" on May 6. Sixty different operas were broadcast in the Third program during the year, including first performances of Igor Stravinsky's *The Rake's Progress* in Venice, It., and of Benjamin Britten's *Billy Budd* at Covent garden. (G. G. Wr.)

After referring to the Lucerne and Copenhagen plans for the distribution of wave lengths within the medium- and long-wave broadcasting bands, the Beveridge committee recommended that the British Broadcasting corporation should give increased and urgent attention to the development of a scheme for higher-frequency broadcasting, using frequencies above 30 mc./s. corresponding to wave lengths below ten metres.

The second of the five high-power television transmitting stations was opened at Holme Moss, Yorks., on Oct. 12, 1951; this station, which gave good reception at 50 or 60 mi., had an aerial about 2,450 ft. above sea level. The carrier frequencies of the vision and sound transmitters were 51.75 mc./s. and 48.25 mc./s. and the corresponding powers were 45 kw. and 12 kw., respectively.

A transmitting station was installed at Wrotham, 20 mi. S.E. of London, and equipped with both the amplitude and frequency systems of modulation of carrier waves in the region of 90 mc./s. (wave length 3.3 m.). The aerial, which was about 1,200 ft. above sea level, was of the slotted type which had been found convenient for broadcasting and television radiation on metre wave lengths. Using transmissions from the Wrotham station, signal strength measurements were made at distances up to about 60 mi.

Other investigations conducted in Great Britain were concerned with the effect of transmission of the waves through the lower atmosphere to distances of 100 mi. or 200 mi. from the transmitter.

The development of radio links as integral parts of trunk networks had been one of the major features of postwar work in the field of communication both in Great Britain and abroad. The intensive research into radar carried out during the years 1939–45 provided a range of basic techniques at decimetre and centimetre wave lengths, which were applied and extended in the course of this peacetime development. As it was part of the policy in developing television in the United Kingdom that in the first instance one program should be made available for the whole country, it was necessary to develop means for distributing the sound and vision signals carrying this program. When the Birmingham station was opened, provision was made for this to be connected to London both by radio link and a coaxial cable. Both systems were designed to carry the video frequency signals over a band width of 3 mc./s., although provision was made for the possibility of having to extend this later. The radio link operated over four stages, two-way transmission being available on separate frequencies in the region of 900 mc./s. The special cable was provided with two separate coaxial lines for the television signals, and a number of other conductors for telephony, monitoring and signalling purposes. Provision was made for repeaters at every three miles along the cable. The characteristics of both the cable and radio links were found to be very satisfactory for the transmission of television with no perceptible delay or distortion of detail. (R. L. S-R.)

Commonwealth.—In Australia, government economies caused a reduction in the annual budget of the Australian Broadcasting commission (ABC) of nearly £150,000, but the position was restored by a measure introduced into the federal parliament in November to raise the licence fee from £1 to £2. During the year the ABC opened two more stations, bringing the total to 54.

The royal commission on national development in the arts, letters and sciences completed its study of broadcasting in Canada and endorsed the existing radio system operated by the Canadian Broadcasting commission.

In South Africa, Springbok radio, a commercial program to supplement the existing noncommercial services in English and Afrikaans, was established in Johannesburg and Capetown. Radio Pakistan opened its new broadcasting house in Karachi on July 16. It included 14 studios and the latest FM transmitters.

Important broadcasting schemes were launched in the British colonies. In Nigeria building began on three main stations at Lagos (20 kw.), Kaduna (7½ kw.) and Enuga (7½ kw.) which would give short-wave coverage in four languages to the whole of Nigeria. The Lagos station began broadcasting at the end of the year. In Cyprus work progressed on the building of a 10 kw. medium-wave station at Nicosia to provide a domestic service for the island in Greek, Turkish and English. In Tanganyika a low-power medium-wave station was set up by the Tanganyika government as a pilot scheme for broadcasting to Africans. Shortage of receiving sets remained a basic problem. There were 800 community listening sets installed in Malaya, which greatly increased the rural audience.

By the end of the year there were broadcasting services in 24 of the British dependent territories. In 14 of these broadcasting was operated by the government, in 7 by commercial companies and in 3 by both. In Singapore the British Far Eastern Broadcasting service opened in May a new high-power short-wave relay transmitter to improve the B.B.C. service to the far east, southeast Asia and southern Asia.

Europe.—A significant step was the proposed admission of the German Federal republic to the European Broadcasting union.

The Italia prize, offered every other year for outstanding radio programs, was divided in 1951 between Great Britain and France, each being awarded 9,000 Swiss francs.

The U.S.S.R. and other Cominform countries greatly increased their output of external broadcasting to Italy, Germany, France, Spain and the United Kingdom during the year. In order to improve the penetration of soviet broadcasts in western Europe, Moscow took over a number of the domestic transmitters in Hungary, Poland and Czechoslovakia.

Radio Free Europe, operating from Munich with U.S. backing opened a medium-wave transmission to Czechoslovakia on May 1. On June 1 it began a short-wave transmission to Albania, and on Oct. 6 a short-wave transmission to Hungary. Railroads.

United States.—U.S. railroads experienced a critical year in 1951 as they enlarged and improved their capacities to meet the demands of industrial and military mobilization. The railroads continued during 1951 to be operated under the token supervision of the U.S. army following the taking over of the railroads on Aug. 27, 1950, by Pres. Harry S. Truman to avert the threatened nation-wide strike called by the Brotherhood of Railroad Trainmen and Order of Railroad Conductors.

Freight traffic in 1951 aggregated 643,000,000,000 ton-miles, and gross freight operating revenues exceeded $10,000,000,000, a new operating revenue record. Operating and other expenses and taxes, however, also increased to new record levels so that net railway operating income fell to $903,000,000, a reduction of $70,000,000 below the 1950 net.

The rate of return on net investment was also lower—3.54% in 1951 compared with 3.96% in 1950.

Expenditures of Class I railroads for improvements and extensions in plant to enlarge capacity and to increase operating efficiency aggregated $1,412,000,000 in 1951, including $1,061,000,000 for rolling stock and $351,000,000 for improvements in roadway, structures and other fixed facilities. During the year the railroads put into service about 3,500 new locomotives, nearly all of them diesel-electric units, and about 84,000 new freight cars. A small number of new passenger-carrying cars were added to equipment.

At the end of 1951 the railroads had on order about 120,000 freight cars and approximately 1,700 locomotives aggregating more than $1,000,000,000 in commitments for equipment. In many cases deliveries of freight cars and locomotives were scheduled for 1951 but were delayed because of shortages or allocations of materials. Deliveries of freight cars were being made at the rate of about 10,000 per month. In October 10,082 cars were put in service; in November 9,824 cars; and in December approximately 10,000. The average number of new cars put in service in 1951 was 7,100 monthly.

Freight car retirements averaged about 4,500 cars per month; approximately 53,000 were withdrawn from service in 1951 as unfit for further service. The net addition to the freight car fleet during the year was about 32,000.

Freight cars badly in need of repair usually constitute about 5% of the total. At the end of 1951 the number of cars in bad order and unfit for service dropped below 5% for the first time in eight months. The decrease of about 9,000 in the number awaiting repairs plus the net addition to the freight car fleet mentioned above meant that approximately 40,000 additional cars were available for service at the end of 1951. The car supply situation was frequently tight, however, and at times there were shortages, particularly of cars required by heavy industries and cars for grain shipments.

Safety Record.—Railroads continued in 1951 to exert efforts to improve train safety, but the record in 1951 was even less satisfactory than in 1950. Reports of the Interstate Commerce commission for the first ten months of 1951 showed 100 passengers killed and 1,164 injured in train accidents, compared with 73 killed and 1,022 injured in the same period of 1950. In train service accidents (including persons not on the trains) 16 were killed and 1,481 injured in the first ten months of 1951, compared with 22 killed and 1,601 injured in the comparable period in 1950.

In the first ten months in 1951, 9,044 train accidents were reported to the ICC, compared with 8,190 in 1950. The number of accidents resulting in casualties was 452 in the first ten months of 1951 and 419 in the same period of 1950.

Freight Rates.—On Jan. 16, 1951, and by amendment filed Jan. 24, 1951, the railroads petitioned the Interstate Commerce commission for authority to increase freight rates and charges generally by 6% with maximum increases in specific sums less than 6% upon certain commodities such as agricultural and forest products. A motion was filed to permit these increases to become effective on one day's notice as interim increases. On March 12, the Interstate Commerce commission authorized interim increases generally of 4% in eastern territory, and 2% in southern and western territories, subject to maximum increases of 2 cents per 100 lb. on fresh fruits, vegetables, melons, preserved food products, lumber and sugar. The increases authorized on grain and grain products were 2%; on coal and coke, 2% subject to a maximum of 6 cents per net ton or 7 cents per gross ton; and lignite coal and briquettes, 2% subject to a maximum of 3 cents per net ton or 3.5 cents per gross ton.

No increases were authorized on the line-haul rates on iron ore to upper Great Lakes ports, on handling charges on iron ore at upper or lower lake ports, on perishable protective services or on wharfage, handling or tippling charges at South Atlantic or Gulf of Mexico ports. Increases were authorized according to the percentage increases in the respective territories on all other special service or accessorial charges.

Hearings were held by the Interstate Commerce commission in a half dozen cities in various parts of the United States. On Aug. 8, 1951, the ICC handed down its decision and order authorizing additional increases as surcharges to be added to the bills for transportation charges, generally, of 9% in eastern territory, and of 6% in southern and western territories and interterritorially, subject to the following maximum increases.

6 cents per 100 lb. on fresh fruits, vegetables, melons and canned foods;
4 cents per 100 lb. on sugar and lumber;
6% on iron ore, grain and grain products;
6% on coal and coke, subject to a maximum increase of 20 cents per net ton or 22 cents per gross ton;
3% on lignite coal and briquettes, subject to a maximum of 10 cents per net ton or 11 cents per gross ton;
20 cents per net ton or 22 cents per gross ton on phosphate rock;
50 cents per net ton or 56 cents per gross ton on potash.

No increase was authorized on charges for perishable protective services, loading or unloading livestock or unloading fresh fruits and vegetables at New York city and Philadelphia, Pa.

The authorized increases were to expire Feb. 28, 1953, unless modified or terminated by action of the Interstate Commerce commission prior to that date. The record was held open for the purpose of re-examining the results of the increases authorized upon carriers' revenues and upon the economy of the country. The increases went into effect generally Aug. 28, excepting those on grain and grain products which became effective Sept. 12, 1951.

On Oct. 19, 1951, the railroads petitioned the Interstate Commerce commission to permit an increase in all freight rates and charges to the full amount of 15% sought in the original petition in all freight traffic territories of the United States. As the year closed this petition was before the Interstate Commerce commission.

A matter of great importance to railroads and shippers during 1951 was the supplementation of railroad tariffs to provide for the increases in freight rates and charges resulting from ICC's permission to increase rates and charges by different amounts on different commodities in different freight traffic territories. Numerous supplements containing the increases had been published by the railroads, and efforts were made in 1951 to reissue supplements containing the changes. This difficult but necessary technical task did not keep pace with the needs of railroads and industries for the reissued information largely because of the necessity of docketing with freight traffic associations changes in rates necessary to restore groupings and rate relationships disrupted by the horizontal or general freight rate cases.

The quotation of freight rates and charges and the use of freight tariffs by carriers had become increasingly difficult and expensive. Many of the tariffs containing the basic rates had not been reissued since prior to World War II.

Defense Transportation.—One of the most important railroad developments of 1951 was the increase in defense and military traffic as a result of the Korean war. Late in 1950 the secretary of defense had announced uniform policies for the co-ordination of the traffic management affairs of the army, navy and air force with respect to the negotiation for commercial transportation services and charges, the routing of military traffic, the use of transportation equipment by the military and the utilization of highway transportation services. These activities were co-ordinated through the military traffic service of the department of defense.

On May 7, 1951, the traffic management division of the General Services administration was given responsibility for the policies and traffic management activities of the executive agencies of the federal government other than the department of defense, the U.S. coast guard, the Atomic Energy commission and the department of agriculture.

The Defense Transport administration continued to adhere closely to the policies and practices followed by the Office of Defense Transportation during World War II in regard to voluntary public participation and co-operation among shippers and transportation companies in transportation, storage and port utilization. DTA continued to rely upon voluntary action and encouragement with a minimum of managerial activity by government to supply necessary services and facilities. It also continued its efforts to stimulate increased ownership and building of freight cars and to secure critical materials for car construction and maintenance. It set a goal of 10,000 new freight cars per month, including 850 tank cars. It directed its efforts toward obtaining 1,200 diesel units and 15 steam locomotives a quarter.

Express Rates.—The Interstate Commerce commission on April 13, 1951, authorized the Railway Express agency to increase rates on shipments up to 99 lb. by 30 cents per shipment, with proportionate increases in multiples of first class rates and charges. These rates became effective Nov. 15, 1951.

A further petition was filed by Railway Express agency on Dec. 22, 1951, seeking an immediate increase in first class rates per pound of 57 cents with proportionate increases in other first and second class rates.

(*See* also INTERSTATE COMMERCE COMMISSION; UNITED STATES.) (G. L. WN.)

Great Britain.—The shortage of coal resulted in the withdrawal of many passenger services and a shortening of the period during which extra summer holiday services were operated. Some relief was obtained by closing certain uneconomical branch lines to passenger traffic; some lines were closed to both passenger and freight traffic. Congestion of freight traffic, particularly in south Wales, was mainly the result of the shortage of train crews; but the source of the problem was the change in direction of traffic and the longer average haul per ton of freight loaded. This had two main causes. First, there was the diversion of coal traffic from export to home consumption; thus, south Wales coal, instead of being shipped at Cardiff, might be consigned to Birmingham, Leeds, London or Cambridge, a situation for which the railway network was not designed. Secondly, government bulk buying seemed to have resulted in development of much crosshaulage which would not have come about under normal trading conditions.

Wage increases were granted to meet the rise in the cost of living and to keep staff in the industry, and the exceptional policy was adopted of recruiting Italians for railway work in Great Britain. Railway traffic receipts, thanks to an increased level of charges for freight, rose by about £27,000,000, largely

THREE-LEVEL passenger coaches in service on the German Federal railway in 1951, featuring double-decker accommodations at the centre of the car and a single level at front and rear accounted for by revenue from the carriage of coal; however, expenditure appeared to have risen more than proportionately and the financial situation gave cause for concern. The British Transport commission asked for a scale of increased passenger fares; this request resulted in a long hearing before the Transport tribunal, and in November the commission asked the minister of transport for an emergency increase in freight charges. Several series of standard locomotives came into service; specific mention should be made of the mixed-traffic Pacific (4-6-2) Britannia class, two series of 4-6-0 main-line locomotives and a standard 2-6-4T type for outer suburban and secondary main-line duties. The first British-built gas-turbine locomotive was handed over to British railways, and several main-line diesel locomotives as well as a large number of diesel shunters were placed in service.

There was consistent improvement in the number of cars available and in the scrapping of obsolete stock; this was mainly the result of the merging into the British railways stock of private fleets taken over on nationalization. About 1,000,000 cars were now available for Great Britain's internal traffic and the percentage under repair or awaiting repair was materially reduced. That the punctuality of trains was still far below the prewar standard was largely the result of speed restrictions caused by extensive permanent-way renewals and the shortage of staff to carry out such renewals. Important works schemes completed during the year included the mechanization of the large marshalling yard at Toton, Nottinghamshire, which was capable of handling 4,000 cars a day, chiefly coal traffic destined for London, the southwest and the eastern counties. At York one of the largest signalling installations in the world was inaugurated in 1951.

Two new train ferries also began working—the "Norfolk Ferry" for the Parkeston (Harwich)-Zeebrugge route and the "St. Germain" (under the French flag), for the Dover-Dunkirk route.

Continental Europe.—In France remarkable results were achieved with the experimental section, electrified on the 50-cycle A.C. system, in the La Roche-sur-Foron area. These results might lead to the reconsideration of electrification proposals in many other countries; British railways announced their intention of testing the same system of traction in the Lancaster area. French national railways (Société Nationale de Chemins de Fer—S.N.C.F.) planned to adopt this 50-cycle system (which could be co-ordinated with the industrial supply system) for the Valenciennes-Thionville lateral line, which carried heavy coal and mineral traffic.

The Netherlands railways had attained front rank in technical progress and efficient operation, and the administration of the new Technical Research and Tests office for all the European railways was entrusted to them. Electric traction was extended to additional main-line sections in eastern and southern Netherlands when the summer timetables were introduced.

Railway developments in western Germany included the replacement of the double track, removed in 1945, on a 33-mi. section of the Mannheim-Basle main line and further electrification in the Stuttgart area. Extensive trials were being made with double-deck coaches.

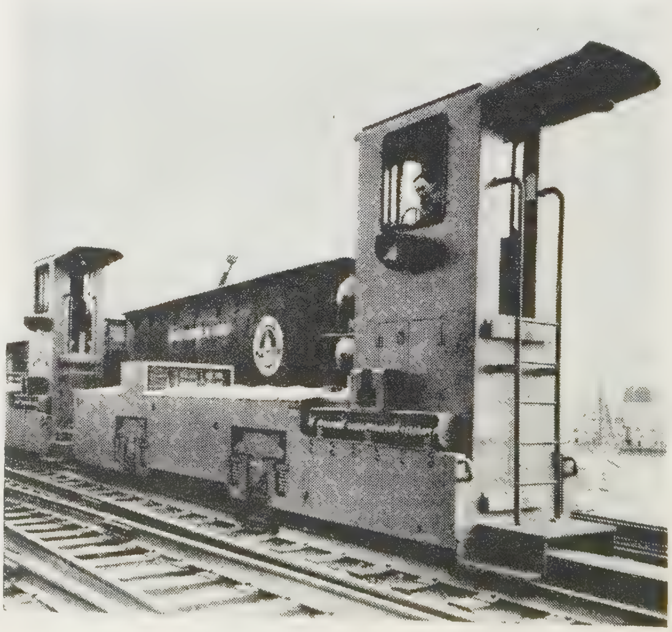
Italian State railways continued to electrify lines in Sicily and elsewhere, but financial considerations delayed electrification between Milan and Venice. In Austria the Linz-Amstetten section was converted to electric traction and further progress made with electrification onward toward Vienna, and construction work continued on the new Semmering tunnel. Swiss federal railways made tests with rubber-tired passenger coaches, similar to those working between Paris and Strasbourg. Avalanches caused great damage to the Gotthard and Simplon railway routes, and sections of the railway in the Po valley, It., were inundated. In Spain the United States-built "Talgo" articulated train, of revolutionary design, operated with success the express service between Irun (on the French frontier) and Madrid, covering the 396 mi. in 8 hr. 55 min.

Consistent progress was being made in the reconstruction of the Spanish National railways. Electrification continued in Norway, and Sweden continued its policy of absorbing private local lines and amalgamating them with the state system. A new ferry service was inaugurated between Gedser (Denmark) and Grossenbrode (western Germany) to avoid the delay caused by passage through eastern Germany. New railway construction in Europe was mainly in the Balkan countries where new lines were opened in Yugoslavia and small sections in Albania and Greece.

Africa.—The South African system continued to rely on steam and electric traction to handle increasingly heavy traffic; more than 60,000,000 tons of freight were being moved annually. Electrification continued on the Cape Western system and on the Rand, the existing conversions costing more than £2,000,000 which was only one-quarter of the entire program. Orders for 345 new steam locomotives and 120 electric units were in hand. Rhodesian railways were equally hard-pressed by expanding traffic requirements, and large numbers of Beyer-Garratt articulated locomotives were on order. East African railways, serving Kenya, Uganda and Tanganyika had record traffic.

Asia.—The rehabilitation of the Japanese state railways was shown by their re-entry into the International Union of Railways (U.I.C.) and by the important programs they prepared for further electrification and reconstruction. The Japanese railways had now electrified about 1,000 mi. of their 3 ft. 6 in.-gauge line, a 1,500-v. D.C. system with overhead feed being adopted. There were about 370 electric locomotives, but multiple-unit electric vehicles were being used on many routes. Important developments in India included the regrouping of the railways. The southern system—consisting of the erstwhile Madras and Southern Mahratta and South Indian railways—was formed in April 1951; the central system—founded on the Great Indian Peninsular railway—and the western system—based on the Bombay, Baroda and Central India railway—were being formed. Indian railway traffic increased considerably; however,

SWITCHER LOCOMOTIVES placed in service at the Baltimore & Ohio's new import docks at Baltimore, Md., in 1951. They ran on narrow-gauge tracks between two lines of freight cars and pushed either or both lines of cars with arms that sprang out on each side of the cab beneath the operator. The electric pushers were powered by a third rail between the tracks



additional rolling stock was now arriving.

Australasia.—Australian railway problems arose from the shortage of labour, fuel and steel, rising prices and the inability to increase the level of charges. In New South Wales new locomotives included Beyer-Garratts for the first time; heavy Australian-built 4-8-2 steam units, oil-burning steam locomotives and electric as well as diesel-electric locomotives were also included. The Sydney-Wallerawang section was being electrified on the 1,500-v. D.C. system.

The Victorian government railways achieved considerable success with brown coal (lignite) as a locomotive fuel; tests were also being made of the use of lignite for gas-turbine locomotives. The Western Australia, South Australia and Commonwealth railways were introducing main-line diesel units. New Zealand government railways made an operating profit in the financial year 1950–51—the first for five years—but labour difficulties delayed electrification progress.

Canada.—The report of the Royal Commission on Transportation in Canada, published in 1951, recommended major changes in the system of freight rates, thereby aiming at the equalization of rates in the different regions of the dominion. New railway construction continued in connection with the development of mineral resources in eastern Quebec and Labrador, the new line starting from Sept Isles on the St. Lawrence. In British Columbia the Pacific Great Eastern railway, owned by the province, was being extended northward to join the Canadian National railways line to Prince Rupert; further extensions to the north were envisaged. In northern Manitoba the C.N.R. was constructing new lines in the Sherridon lake area, again in connection with the development of mineral resources. The same railway acquired a 26-mi. section of line between Quebec city and St. Joachim, thus giving it direct access to Murray bay; construction toward Labrador might also be started.

In November a new signalling system, controlling 40 track-miles, was inaugurated at Hornepayne, Ont., on the transcontinental main line. Automatic block signals were installed between Jackman and Red Pass junction in British Columbia. The Canadian Pacific railway's new mechanized hump marshalling yard at St. Luc near Montreal was the first of its kind in Canada. Canada could now not only meet its own requirements of diesel locomotives but was also in a position to export them. The first big diesel unit of Fairbanks Morse design from the Canadian locomotive works at Kingston entered service in the summer; there were also diesel-building shops in Montreal and London, Ont. Connections between Newfoundland and the mainland were examined by the royal commission.

South America.—An official statement placed the Argentine railways' operating loss by the beginning of 1951 at 543,000,000 pesos. Large contracts for new rolling stock, mainly diesel-electric locomotives and rail cars, were placed in the Netherlands; many of the new passenger cars were to be air conditioned. Other diesel-electric units were on order from the United States.

In Brazil, government purchase of the British-owned Leopoldina railway was reported to be complete in November. Local production of rolling stock and rails was progressing, but large orders for traction units—steam, electric and diesel-electric—had to be placed in the United States and Europe. Construction continued of a rail link between Chile and Brazil via Bolivia. (*See* also Electric Transportation.) (C. E. R. S.)

BLACK MARKET NYLON hose for sale on a London street; the illegal traffic drained regular markets of more than half their supply of nylon stockings in 1951 and meant a serious loss to British exports

Rayon and Other Synthetic Fibres.

The U.S. Federal Trade commission issued on Dec. 11, 1951, trade practice rules for the rayon and acetate textile industry, in which the official definitions of rayon and acetate fibres were given, as follows:

> Rayon: Man-made textile fibres and filaments composed of regenerated cellulose and yarn, thread or textile fabric made of such fibres and filaments.
>
> Acetate: Man-made textile fibres and filaments composed of cellulose acetate, and yarn, thread, or textile fabric made of such fibres and filaments.

The commission, in officially issuing these definitions, answered two long discussed problems in nomenclature: (1) whether the term rayon was to apply to all fibres of a cellulose base, that is, derivatives of natural products, wood pulp and cotton linters, or whether acetate cellulose was sufficiently different in physical and chemical characteristics to warrant a separate identity; and (2) whether the term synthetic fibres was acceptable as a generic name for the many new types which had come into production since rayon and acetate had appeared. The adoption of man-made fibres as an all-exclusive term for both rayon and the newer fibres was the Federal Trade commission's solution.

So rapidly did the production of new fibres develop during 1951 that there was danger of ignoring the fact that, quantity-wise, the newcomers were still much in the minority.

Market conditions during the year were not encouraging to an industry which had become accustomed to yearly increases in production and consumption. In the United States, textile supplies, especially in the field of women's and children's clothing, were more than sufficient to meet the demand. In the man-made fibre field, stocks of yarn and fabric accumulated rapidly, continuing a trend which had started in 1950 when retailers and garment makers complained of the dearth of business. But the first quarter of 1951 saw the production of rayon fabrics in the United States reach the highest point in recorded trade history. The first quarter's production was 636,300,000 yd. The highest previous quarter was in the fourth quarter of 1950 with a production of 632,200,000 yd. The second quarter showed some sliding off, and by the third quarter, the mills had become painfully aware of the backing up of demand. The third quarter showed a production 30% lower than in the same period of 1950. The total production for 1951 was 2,046,000,000 yd. compared with the 1950 total of 2,426,000,000 yd.

A reflection of the mill curtailment was the unprecedented accumulation of yarn stocks by the producers. Ever since the development of rayon on a large scale, especially since the middle 1930s, producers' stocks of yarn had been low, as the demand had been such that their orders were usually close to their production capabilities. In 1951, however, stocks of filament yarn rose to 91,300,000 lb. from 6,100,000 lb. in 1950. Staple and tow yarn showed stocks of 15,200,000 lb., compared with 2,000,000 lb. in 1950. Shipments to broad goods weaving mills totalled only 430,000,000 lb. during 1951, compared with 535,000,000 lb. in 1950.

However, the rayon yarn producers found encouragement in the tire yarn field. The production of tirecord yarn rose from 305,000,000 lb. in 1950 to 333,000,000 lb. in 1951. There was also an increase in the production of staple and tow yarn, from 305,000,000 lb. in 1950 to 336,000,000 lb. in 1951. Filament yarn, while representing 50% of the total capacity, dropped from 645,000,000 lb. in 1950 to 625,000,000 lb. in 1951. The over-all production figure was slightly above 1950, *i.e.,* 1,294,000,000 lb. in 1951, compared with 1,259,000,000 lb. in 1950.

The popularity of acetate filament yarn was of fairly recent origin. The first recorded production in the U.S. in 1919 was 100,000 lb. In 1951 production of acetate filament yarns had grown to 300,100,000 lb. Acetate staple, which did not enter commercial production until 1935, with 300,000 lb., amounted to 128,700,000 lb. in 1951. In 1940 the consumption of acetate filament yarn was about half as much as the viscose and cuprammonium types. Ten years later, in 1950, the consumption in each group was about equal.

In the field of other man-made fibres, nylon continued to increase in production. Its chief use in hosiery, added to its second most important use in knitted fabrics, otherwise known as warp knit or tricot, was further expanded by higher yardage of woven fabric. Nylon hosiery in 1951 reached a production of 52,000,000 dozen pairs, compared with 55,200,000 dozen pairs in 1950. Nylon knitted fabric production was reported in 1951 as at the annual rate of 5,900,000 lb., based on 1950 industry reports. Nylon woven fabric in 1951 reached a total of 146,800,000 yd., compared with 110,200,000 yd. in 1950. Glass fibres achieved in 1951 the status of being separately reported in official statistics. Without comparable figures for previous years, the 1951 production for the first three quarters of the year showed a rising trend, 3,600,000 yd., 4,100,000 yd. and 4,400,000 yd., respectively, with an estimated sharp rise in the last quarter. A total of 17,000,000 yd. to 18,000,000 yd. was expected for the year. The vogue for automobile slip covers of plastic fibre was indicated by the fact that the monofilament production was also reported for the first time. Beginning with the second quarter of the year, production was at the rate of about 14,000,000 yd. annually. While individual production figures on the new fibres were not published, at the end of 1951 it was estimated that the total production in 1951 of nylon and all other synthetic fibres, including Dynel, protein fibres, Saran and other monofilaments, was 210,000,000 lb.

In 1951 total world production of rayon and acetate was estimated at 3,960,000,000 lb., of which 2,120,000,000 lb. was filament yarn and 1,840,000,000 lb. was staple. This was an increase from a total of 3,494,000,000 lb. in 1950, including 1,929,000,000 lb. of filament and 1,564,000,000 lb. of staple. The U.S. share was 45% of the filament, compared with 50% in 1950 and 18% of the staple, compared with 20% in 1950. It was announced that the owners of the nylon patents, E. I. du Pont de Nemours, had arranged for the licensing of a new Japanese enterprise for nylon production. Nylon production was expanding in Great Britain and various countries of Europe, and new plants for acrylic production were reported in Germany. (*See* also Wool.) (I. L. Bl.)

Reconstruction Finance Corporation. The Reconstruction Finance corporation was established by the U.S. congress on Jan. 22, 1932. Since that time its powers and duties have been periodically renewed and amended by the congress to meet changing national needs. By statute its lending powers extend to June 30, 1954, and the life of the agency to June 30, 1956. Its capital stock is $100,000,000, all held by the United States.

Management and Organization.—Authority for the management and direction of the RFC is vested in an administrator and a deputy administrator, both appointed by the president, with the advice and consent of the senate. This form of organization was instituted by the president in a reorganization plan which took effect in May 1951. Under this plan the former board of directors of the RFC was abolished, and all its functions were transferred to the administrator.

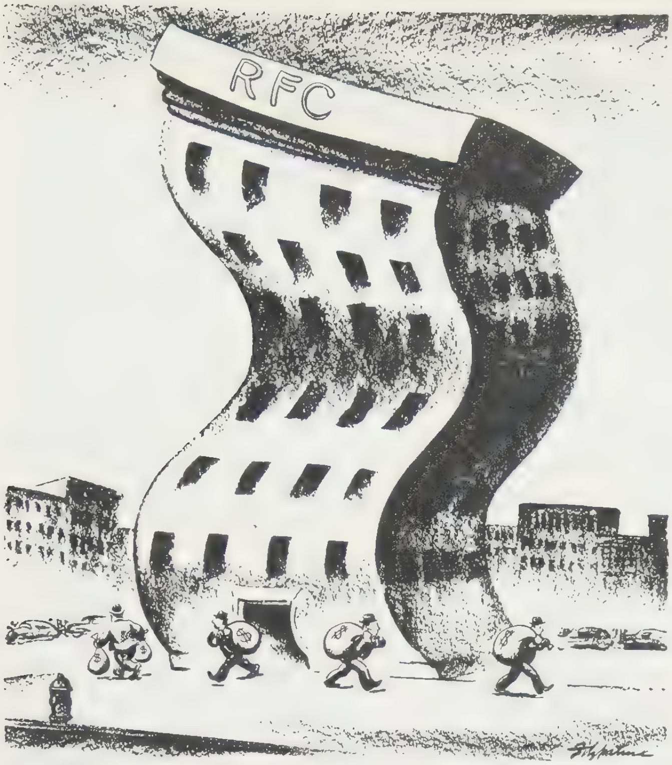
The reorganization plan also established a loan policy board composed of the following members: the administrator, as chairman; the deputy administrator, as vice-chairman; the secretary of the treasury, the secretary of commerce and one other person to be designated from time to time by the president from among the officers of the United States who are required to be appointed by and with the advice and consent of the senate.

The loan policy board establishes general policies (particularly with reference to the public interest involved in the granting and denial of applications for financial assistance by the corporation and with reference to the co-ordination of the functions of the corporation with other activities and problems of the government) which govern the granting and denial of applications for financial assistance by the corporation.

The corporation functions through a principal office at Washington, D.C., and loan agencies established in 33 cities throughout the United States.

Functions.—The RFC is authorized to make loans to business enterprises (including railroads and air carriers); to make loans to financial institutions; to subscribe for and make loans upon the nonassessable preferred stock of insurance companies and to purchase the legally issued capital notes and debentures thereof; to purchase the securities of and to make loans to states, municipalities and other public agencies; and to make loans because of floods or other catastrophes.

Under the RFC act, as amended, the Defense Production Act of 1950 and applicable executive orders and regulations, the corporation also makes loans (including bank participations) to business enterprises for the purpose of financing defense pro-



"CROOKED OR JUST FUNNY LOOKING?" a 1951 cartoon by Fitzpatrick of the *St. Louis Post-Dispatch* (Mo.)

duction. In addition, the corporation is authorized to purchase securities or to make loans (including participations therein or guarantees thereof) for the purpose of aiding in financing projects for civil defense purposes.

Other functions relate to the production of strategic and critical materials—synthetic rubber, tin and abacá (Manila hemp) and the liquidation of certain defense plants and facilities.

Operations.—Loans to business enterprises, directly and in participation with banks, during the fiscal year 1951 constituted the principal lending activity of the corporation. Such loans were made primarily for the purpose of assisting, expediting, increasing or maintaining the production of goods or services necessary to meet either military requirements or essential civilian requirements. From June 30, 1950, through June 30, 1951, 5,770 applications for such loans, amounting to $600,000,000, were received; and 2,702 loans were authorized (including 38 Defense Production act applications approved under RFC's regular lending authority) in the gross amount of $301,000,000, in which banks participated to the extent of $16,000,000. More than 51.6% of the number of these loans were for $25,000 or less, and approximately 89.2% of the number did not exceed $100,000. On June 30, 1951, 7,067 business loans were outstanding in the aggregate amount of $463,000,000. In addition, the corporation had outstanding commitments to participate in 3,933 business loans made by banks, totalling $121,000,000, of which RFC's share was $78,000,000.

Other loans or purchases of obligations authorized during the fiscal year included those to states, municipalities and other public agencies, $2,800,000; and catastrophe loans aggregating $2,400,000. As of June 30, 1951, total loans and investments outstanding amounted to approximately $841,000,000. Under the provisions of section 302, Defense Production Act of 1950, 453 loan applications in the aggregate amount of $1,200,000,000 were directed to RFC for review, 38 of these applications were approved in the amount of $62,000,000 under RFC's regular lending authority and certificates of approval were received from the various delegate agencies for an additional 40 loans aggregating $68,000,000.

The Texas City, Tex., tin smelter, which was constructed by RFC as a national defense measure in 1942, continued in operation. During the fiscal year June 30, 1950–June 30, 1951, RFC acquired and produced 36,835 long tons of refined tin. Sales of metal during that time amounted to $112,904,777.

Virtually all facilities for producing general-purpose synthetic rubber, known as GR-S, as well as the plants for the production of butyl, used principally in the manufacture of inner tubes, are government-owned and are operated for the account of RFC. During the 1951 fiscal year, 638,118 long tons of synthetic rubber were produced, and sales amounted to $298,143,047. At the close of the fiscal year, 27 plants were in operation. These projects represented an investment of approximately $496,000,000.

The four abacá plantations located in Costa Rica, Guatemala, Honduras and Panamá continued in operation during the fiscal year 1951, and 19,500,850 lb. of fibre were produced and 19,987,200 lb. sold for $5,543,578.

As of June 30, 1951, there remained for liquidation, defense plants and other facilities (exclusive of synthetic-rubber facilities, the tin smelter and the fibre plantations) constructed or otherwise acquired for purposes of national defense prior to and during World War II at a cost of $53,016,134.

(W. S. Sn.)

Red Cross.

United States.—High lights of the work of the American Red Cross in 1951 were in the national blood program, services to the armed forces, civil defense preparation and disaster relief.

The national blood program was expanded widely, several new regional programs and defense centres being added to meet increasing needs for blood. While civilian needs continued at a high level armed forces demands soared, and collections reached the largest volume since World War II. The increase, however, was not enough both to meet rising military needs in Korea and to build a reserve of dried plasma. In the summer the Red Cross joined with the department of defense in a vigorous campaign to increase donations. By October there was an upsurge in the total collections obtained through 43 regional centres and 10 defense centres. A total of 800 communities were being visited by 121 "bloodmobiles." Collections were also made by 14 community blood banks co-operating with the Red Cross and by the department of defense on domestic military installations.

Red Cross field workers served throughout the year with U.S. troops overseas and on military installations in the United States. Behind them stood chapter workers in local communities, who helped servicemen's families by providing counselling and guidance, assistance with communications and reporting, and financial help when necessary. Chapter workers and Red Cross staff in Veterans administration offices assisted veterans and their dependents in obtaining government benefits, and Red Cross staff served in military hospitals and in veterans' hospitals.

Recognizing that a major emergency would be attended by a critical shortage of medical and nursing help, the Red Cross increased its efforts to train as many people as possible in first aid and home nursing. More first-aid certificates were issued than in any year since World War II—by October the total was 1,298,000. Home-nursing certificates issued had reached 250,000. Special emphasis also was laid on the training of volunteer nurse's aides.

In the Red Cross water safety program, 788,655 swimming and lifesaving certificates had been issued and 26,455 instructors authorized by June 30. The survival swimming course was adopted early in the year as an official training course of the navy. During the summer the Red Cross operated 32 aquatic schools at which 2,500 persons received intensive training in water safety skills.

The largest of more than 300 disaster relief operations during the year involved assistance to 27,000 flood-stricken families in Kansas, Missouri, Oklahoma and Illinois. The total cost of the operation was expected to approximate $12,000,000. During the fiscal year 1950–51, assistance was given to more than 75,000 families in 535 counties located in 45 states.

International activities of the American Red Cross included relief to war refugees in Korea, where the Red Cross joined with the United Nations and the far eastern command in a broad civilian relief and rehabilitation operation. Co-operating with the League of Red Cross Societies, the American Red Cross also sent aid to refugees in Turkey, famine sufferers in India, earthquake victims in El Salvador and the hurricane-stricken in Jamaica. Aid was given to Red Cross societies in other countries for the development of their programs, including those in Germany, Japan, Yugoslavia and Iran. During 1950–51 study visitors from 15 countries journeyed to the United States.

The Junior Red Cross program of bringing the youth of the world closer together in mutual understanding continued. Members in the schools prepared gift boxes and school chests for overseas shipment, and exchanged thousands of paintings and correspondence albums. Extensive community services included gifts of goods and services to civilian and military hospitals and a wide range of volunteer work in co-operation with adult Red Cross services. College students, working through local chapters, participated as adult members in Red Cross programs.

(J. G. MA.)

World.—In South Korea, the Italian, Norwegian and Swedish Red Cross societies each provided fully staffed and equipped 100-bed field hospitals; the Danish Red Cross a hospital ship; and the Siamese Red Cross a medical team for sick and wounded members of the United Nations forces. The Red Cross societies of Australia, Belgium, Canada, Great Britain, the Philippines and the United States assigned more than 100 welfare officers for service with their respective troops and in hospitals. At the request of the United Nations, the League of Red Cross Societies recruited five medical welfare teams for service to the civilian population of South Korea, and member societies of the league contributed civilian relief supplies valued at approximately $1,000,000.

In North Korea, the Chinese Red Cross provided 72 epidemic control experts; the Hungarian and Rumanian Red Cross societies each contributed a field hospital; and the Bulgarian Red Cross sent almost 100 tons of food, clothing and medical supplies.

The International Committee of the Red Cross inspected prisoner of war camps in South Korea but was refused entry into North Korea. (*See* PRISONERS OF WAR.)

In the field of international disaster relief, Red Cross societies contributed more than $2,000,000 for assistance to victims of earthquakes in Colombia and El Salvador, cyclones in the West Indies, famine in India and floods in Italy. In September a disaster relief seminar for Latin-American Red Cross societies was organized by the League of Red Cross Societies in Mexico City.

In May representatives of 17 national Red Cross societies met in Hanover, Ger., at the request of the League of Red Cross Societies, to study the refugee situation in Germany and Austria. Red Cross assistance to these and other refugees in Turkey, Lebanon, Syria, Jordan, that part of Palestine held by Egypt, Pakistan and India totalled approximately $750,000.

In October representatives of 20 of the 22 Red Cross societies of the Americas held their sixth Inter-American Red Cross conference in Mexico City.

Yugoslavia released an additional 364 Greek children to the International Red Cross for repatriation under resolutions voted by the United Nations general assembly in 1948, 1949 and 1950. Efforts of the International Red Cross to obtain repatriation of Greek children living in Bulgaria, Czechoslovakia, Hungary, Poland and Rumania failed, and in November the United Nations general assembly in Paris called upon government representatives of those countries to meet in Paris during the assembly for discussions on this subject.

The International Committee of the Red Cross continued its work of reuniting families dispersed during World War II, particularly in central Europe.

Toronto, Ont., was selected for the 18th International Red Cross conference and the 22nd session of the board of governors of the League of Red Cross Societies, July 23–Aug. 8, 1952.

Refugees.

The International Refugee organization terminated its activities on Jan. 31, 1952, after four and one-half years of service to refugees and displaced persons in Europe and the far east resulting from World War II. In that time 72,834 refugees had been repatriated to their countries of origin and 1,038,750 resettled in other countries. Eighteen governments, Australia, Belgium, Canada, China, Denmark, the Dominican Republic, France, Guatemala, Iceland, Italy, Luxembourg, the Netherlands, Norway, New Zealand, Switzerland, the United Kingdom, the United States and Venezuela, members of the organization, had contributed a total of $406,867,295 to accomplish these results.

More than 1,000,000 persons were under care and maintenance in camps for varying periods of time awaiting repatriation or resettlement. The total expenditures of the organization were estimated at $429,775,450.

In the final period of the organization's activities from July 1, 1950, to Jan. 31, 1952, 257,335 refugees were moved to new homes in Argentina, Australia, Brazil, Canada, Chile, New Zealand, the United States and other countries.

The I.R.O. continued its efforts during 1951 to make arrangements for the permanent care and hospitalization of refugees who, because of age or infirmities, were unable to provide their own support. Approximately $20,000,000 of the organization's funds was spent in securing custodial care for 32,000 such persons and their dependent relatives. Many were placed in existing homes for the aged and in religious institutions in western European countries. Sweden, for instance, accepted 335 tuberculous patients and their dependents. Norway accepted blind refugees for training and tuberculous refugees for hospitalization. By Dec. 31, 1951, only 362 families remained for whom no such arrangements had been completed, 333 in Shanghai and 29 in the Philippines. The former were transferred to the custody of the U.N. high commissioner for refugees with funds for their care for six months and the latter to the World Council of Churches with an appropriate financial grant.

Shipping operations of the organization continued into Jan. 1952 but, when finally terminated, 12,205 refugees remained awaiting transport to overseas countries of reception. Funds for the movement of this final group were turned over to the Provisional Intergovernmental Committee for the Movement of Migrants from Europe. This committee had been organized at a conference on migration convened by the Belgian government in

ORPHANS evacuated from Seoul early in 1951 shown at a refuge on the island of Cheju, south of Korea, after they had had adequate food and medical attention

Brussels in Nov. 1951. Twenty-seven governments attended the conference and 16, including those of emigration and immigration countries, voted to establish the committee. A budget of $36,954,000 was adopted at the first session of the committee, which planned to move 116,000 persons during one year of operations. These were to include refugees and ordinary migrants from western Germany, Austria, the Netherlands and Greece who would not otherwise be moved. It was estimated that 40,000 would be moved to Canada in the period, 25,000 to the United States, 25,000 to Australia, 18,000 to Brazil, 4,000 to Chile, 3,000 to Bolivia and 1,000 to other countries. The governments which indicated their intention to participate as members of the committee were Austria, Australia, Belgium, Brazil, Canada, Chile, the German Federal Republic, France, Italy, Luxembourg, the Netherlands, New Zealand, Sweden, Switzerland, Norway, Venezuela and the United States. The financing of the committee's budget was to result partly from outright contributions by member governments and partly from reimbursements by receiving governments for the transport of persons moved to their countries.

The general assembly of the United Nations established the Office of High Commissioner for Refugees at Geneva, Switz., on Dec. 14, 1950, and elected G. J. van Heuven Goedhart of the Netherlands as high commissioner for a three-year period beginning Jan. 1, 1951. This office was set up to provide legal protection for refugees until they acquired nationality in their new countries of residence.

At its sixth session in Paris in Dec. 1951, the general assembly of the United Nations approved a budget of $718,000 submitted by the high commissioner to cover the administrative expenses of his office and 11 branch offices in the important countries of residence of refugees. These offices were to intervene with the governments of the countries in which they were located to ensure that refugees received minimum rights and privileges essential to the achievement of self-dependence. Such rights and privileges included among others freedom from arbitrary expulsion, access to the courts, the right to work, opportunities for education, participation in the benefits of social security systems and the possession of travel and identity documents. The high commissioner reported that such offices had already been established in Bonn, Ger., Vienna, Aus., and Washington, D.C.

The U.N. general assembly in Dec. 1950 decided to convene at Geneva in 1951 a diplomatic conference to complete and sign the convention relating to the status of refugees recommended to it by the Economic and Social council. This conference was held in July 1951. Twenty-two governments were represented. The draft convention presented to the conference was amended to give the signatory governments more discretion in applying the provisions of the convention in situations in which the security of the governments might be affected. The convention was signed by 15 governments. The convention provided that signatory governments might exercise a choice to apply the provisions of the convention to refugees arising from events in Europe prior to Jan. 1951 or to refugees whatever their origins might be.

The definition of refugees contained in the convention was more limited in scope than that contained in the statute of the Office of the High Commissioner. The refugees falling under the competence of the high commissioner were, in general, those previously the concern of the International Refugee organization—namely, those unable or unwilling to avail themselves of the protection of their former countries of nationality for reasons of fear of persecution because of race, religion or political opinion. However, persons recognized by the authorities of the countries in which they had taken residence as having the rights and obligations attached to the possession of the nationality of their country of residence did not fall under the competence of the high commissioner.

The 9,500,000 prewar members of the German minorities in Poland, Czechoslovakia, Hungary and Yugoslavia who were in western Germany did not fall under his competence. Their situation improved slightly during 1951 because of rising economic levels in western Germany. However the problem of securing their integration in the economy of that area continued to challenge the resources of the Bonn government and the occupying powers. The flow of refugees from eastern Germany continued at a monthly rate of more than 20,000 during the year.

Certain provisions of the United States Displaced Persons act of 1948 which, as amended, were to expire on June 30, 1951, were extended to Dec. 31, 1951, by action of the U.S. congress. More than 300,000 refugees and displaced persons, the maximum permissible under these provisions, received U.S. visas before the final deadline. The U.S. Displaced Persons commission continued in operation to select migrants of German ethnic origin who could be granted visas up to June 30, 1952, under section 12 of the act. About 28,000 of these, eligible for admission to the U.S., remained to be visaed on Dec. 31, 1951.

United Nations efforts to resolve the problem of 875,000 Arab refugees in Lebanon, Jordan, Syria, Gaza and Israel, resulting from the conflict in Palestine in 1948, continued during 1951. The United Nations Relief and Works Agency for Palestine Refugees took over responsibility for this task from its predecessor agency, the United Nations Relief for Palestine Refugees, on May 1, 1950. At its sixth session in Paris in 1951 the general assembly of the United Nations accepted the recommendation of the agency for a program envisaging the raising and spending of $50,000,000 for relief and $200,000,000 for the reintegration of these refugees to be carried out over a period of three years starting as of July 1, 1951. Religion. Notable events in religion during 1951 were the 1,500th anniversary of the Council of Chalcedon at Rome; the 1,900th anniversary of St. Paul's mission to Athens in Greece; the closing of the Holy Year at Fatima in Portugal; the beatification of Pope Pius X; intensified persecution of Christians in many Communist-controlled lands—notably Bulgaria, China and Korea, with the resignation of T. C. Chao from the presidium of the World Council of Churches; and the failure of all but a few Christian leaders from behind the "iron curtain" to attend ecumenical functions as evidences of persecution in its subtler aspects.

Incredulity, not unnaturally, greeted the news of the "Protestant Church day" (Kirchentag) in Berlin, with approximately 400,000 persons in attendance from both sides of the "iron curtain," and more than 200 foreign visitors and speakers, dealing with the theme "We are, despite all, brethren." Such outstanding leaders as Stanley Jones and Toyohiko Kagawa both visited Germany, where interest in religion was markedly increasing. Almost equally symptomatic of German religious revival were a meeting in France of the German-French Christian fellowship to discuss the problems of Europe, and the public confession of the German Evangelical Church of its sins against Jews with strong admonition to its members to show their sincerity by caring for Jewish cemeteries.

The real purposes of communism with respect to all religion became progressively clearer, and its studied denunciation of all western Christian life was intensified; *e.g.,* in the rash of "denunciation meetings" forced upon the Chinese Christians, as well as the charges of mass murder made against devoted Catholic workers in mission orphanages and hospitals. It was a time of intense suffering for many hard-pressed Christians, although those within metropolitan U.S.S.R. seemed largely to have escaped the worst forms of maltreatment, since nearly half the people in European U.S.S.R. were still loyal to the churches. No such restraints operated where Christians were in the minority. A new form of campaign to make the churches destroy themselves from within was discerned in various parts of the vast area dominated by Communist totalitarian dictatorship.

In Yugoslavia, former "iron curtain" area, Archbishop Aloysius Stepinac was released and greater freedom was accorded all churches.

At the Festival of Britain, as well as in the jubilee commemorating the founding of the federal government in Australia, religion played a notable part. In London, on Ascension day, May 3, the festival began formally with a service in St. Paul's cathedral. The archbishop of Canterbury preached the sermon.

A notable development of the festival was the widespread revival in England of religious drama. The Society for the Propagation of the Gospel celebrated its 250th anniversary and a new edition of *The Reader's Bible* marked the festival year, as did increased church membership, larger Sunday school attendance and continued response to religious broadcasts. The Eighth Methodist Ecumenical conference met at Oxford, Eng., changing its name to World Methodist council.

In the United States, united campaigns of evangelism under the National Council of the Churches of Christ in the U.S.A. in cities and universities totalled 40, teaching missions numbered 52, with 26 weeks of "visitation evangelism." Staff work was provided for similar undertakings in Japan. The response was almost uniformly encouraging.

Rome created four new U.S. dioceses. Seattle became an archdiocese. The church's status in the Union of South Africa was changed and archbishoprics were set up in Capetown, Durban, Pretoria and Bloemfontein. The pope issued three encyclicals: *Evangelii Praecones; Ingruentium Malorum,* calling attention to contemporary evils and exhorting the faithful to intensified prayer; and *Sempiternus Rex,* the latter appealing to all Christians to unite and fight under a single banner against communism.

The Roman Church was, like other churches, troubled by the Communist move to set up independent churches in China, Poland and Hungary with Communist "yes men" as their leaders.

Although Quakers visiting Moscow at the invitation of the soviet government returned with the claim that all was sweetness and light in Moscow, the rest of the Christian world was agreed in accepting the warnings of the World council concerning the sinister nature of Communist peace propaganda.

Jews and Protestants in the U.S. were virtually unanimous in opposing the appointment of an ambassador from the United States to the Vatican state. The president blundered, they said, into an action which would divide and embitter U.S. religious groups.

At the end of 1951, 100 U.S. Jewish chaplains were in uniform, recruited by the three major rabbinical associations. Of the 255 Reformed congregations in the U.S., 240 had moved toward increased ritualism and toward what resembled traditional Judaism. Influx of Jewish families into the suburbs of the larger cities contributed greatly to synagogue growth, and a number of new congregations were reported to have been established.

In the fall of 1951, headquarters of Reformed Judaism was moved from Cincinnati, O., to the House of Living Judaism in New York city. The National Sabbath commission, sponsored jointly by the Rabbinical assembly and the United synagogue, was established. Four leading theological schools enrolled 1,289 students. The Synagogue Council of America celebrated its 25th anniversary during 1951.

The Commission on Justice and Peace of the Central Conference of American Rabbis linked its endorsement of United Nations action in Korea with opposition to communism and all other forms of totalitarianism. The Synagogue Council of America joined Christians in supporting the "aid to India" bill.

The World Brotherhood movement, launched by the (U.S.) National Conference of Christians and Jews, expanded to other lands including France, Denmark, Italy, Luxembourg, Germany and Switzerland, Canada and the United Kingdom having previously been related to it. Religious Education. **Protestant and Orthodox.**—Early in 1951 the report of a "World Study of Church Youth Work" was published by the World Council of Christian Education and Sunday School association. The study was undertaken on behalf of this council and two other world bodies—the World Council of Churches and the International Missionary council. It brought together an unprecedented body of information about the status of Christian youth work in many countries.

Good progress was made during the year toward the third World Conference of Christian Youth to be held in India in 1952. A special conference committee, composed chiefly of Asiatics, met in Calcutta in Dec. 1951 to carry forward the planning. The theme chosen was "Christ, the Answer." The conference was being sponsored by five world organizations: World's Student Christian federation, World's Young Women's Christian association, World's Alliance of Young Men's Christian associations, World Council of Christian Education and Sunday School association and World Council of Churches. The first such conference was held in Amsterdam, Neth., in 1939, and the second in Oslo, Nor. in 1947.

In December the Latin American Union of Evangelical Youth held its third congress, in Buenos Aires, Arg. The delegates numbered about 80 from 14 countries. The theme of the congress was "United Christianity and Evangelization." Lima, Peru, had been the site of the first congress in 1941; the second was in Havana, Cuba, in 1946.

Encouraging new developments occurred in two countries of Africa. The Christian council of Nigeria, in its biennial meeting in August, acted to establish a board of youth work. In the Gold Coast the Christian council decided to appoint an education committee to be concerned with Christian education in both church and school. The new African ministers in the government proposed a restudy of existing laws regarding the relation of religion and education, and the first task assigned the new committee was to draw up a statement of basic principles on religious education in both denominational and nondenominational schools. This was to be sent to the government's director of education.

St. Vladimir's Orthodox Theological seminary in New York city continued its training of students for English speaking parishes in America. In addition to its regular theological training program, St. Vladimir's took the initiative in organizing the Orthodox students in American universities in Orthodox Christian fellowships. The seminary was also sponsoring evening classes for Sunday-school teachers. (F. L. Kp.)

Roman Catholic.—The Catholic school system includes five classes of institutions: parochial or elementary, secondary, normal, seminary and university. Institutions in the seminary division are of two classes, preparatory and major. In 1951 there were 2,575,329 students in 8,202 parochial elementary schools, and 80,412 in 508 private elementary schools; 337,414 students attended 1,628 diocesan and parochial high schools and 197,597 attended 801 private high schools; 236 colleges and universities were instructing 236,636 students; 28,798 seminarians studied at 392 seminaries.

The theme of the annual convention of the National Catholic Educational association was "Human Rights and Education." Resolutions were passed to encourage teachers to emphasize more forcibly the various aspects of human rights in their instruction of Catholic youth, to encourage greater emphasis on human rights in teacher training programs, to encourage a deep regard for human rights in the administration of Catholic education.

Mrs. Caroline J. Putnam, founder and president of Catholic Scholarships for Negroes, Inc., reported that the organization was assisting 75 Negro students. Among them were 23 studying to be teachers, 12 doctors, 9 nurses and 4 social workers.

The Panama Canal Zone's only Catholic school reported that it was overcrowded at the end of its first year. In 1950 the school had 314 students; in 1951 the enrolment was 340, with a waiting list of 160. The school was conducted by the Vincentian missionaries and staffed by ten Sisters of the Third Order of St. Francis.

In conformity with the ideals set up by the Catholic Rural Life conference, Xavier high school in Dyersville, Ia., transformed itself into a Catholic agricultural high school while still maintaining all the cultural studies. (J. LaF.)

Jewish.—On Jan. 13 and 14, 1951, the first national conference devoted to Jewish education took place in New York city. The conference surveyed the status of Jewish education in the United States, its achievements and its failures and the problems involved in the task of expanding and deepening the educative process for the children and young people, with a view to defining the objectives of education for Jewish living and devising a program of community action for their realization.

The movement for day schools was growing despite the added financial burden which was bearing down heavily upon the sponsors. The Conservative group had difficulty in accommodating all who wished to enlist in the summer camps which that group had instituted.

Courses in Modern Hebrew in the high schools of New York were winning devotees both in students and sponsors. The success of the Israeli state accounted a great deal for the popularity of these courses. The first secular Jewish institution of higher learning, Brandeis university, was growing and developing.

Some, though not significant, progress was evident in Jewish education in European countries.

In Israel consideration of the improvement and expansion of Jewish education constituted a major preoccupation for the government, despite the colossal economic and political problems with which the government was faced.

Jewish education for the Jews of the U.S.S.R. was, in 1951, literally nil. (B. H.)

Republican Party.

The Republicans utilized 1951 as a year for framing issues and strengthening their party in preparation for the 1952 presidential election. In co-operation with southern conservatives in congress, they rejected or sidetracked almost all of Pres. Harry S. Truman's domestic "fair deal" program. Meanwhile, they sought to resolve disagreements among themselves, especially on foreign policy, and to minimize the growing threat of an intra-party squabble over the 1952 presidential ticket.

"AHEM!" a cartoon by Herblock of the *Washington Post*, published in 1951

The G.O.P. drew encouragement from the scattered elections held during 1951. In ten contests to fill vacancies in the house of representatives, they netted a gain of two seats. This increased their membership in that body from 199 to 201, as against 232 Democrats, 1 Independent and 1 vacancy.

The Republicans lost one seat in the senate through the death of Sen. Arthur H. Vandenberg of Michigan. Gov. G. Mennen Williams, a Democrat, appointed Blair Moody, a Washington newspaper correspondent to fill the vacancy, and he increased the Democratic representation from 49 to 50. With the death in November of Sen. Kenneth S. Wherry of Nebraska, minority floor leader, the Republican membership was reduced to 45 at the year's end, but Nebraska's Republican governor, Val Peterson, restored the lineup to 50 Democrats and 46 Republicans by appointing another Republican, Fred A. Seaton, to fill the vacancy at the 1952 session.

Municipal elections on Nov. 6 also had a Republican trend. Although Republicans were not the actual beneficiaries, the outcome in Boston, New York and Philadelphia reflected popular reaction against corruption at both the local and national levels. The G.O.P. was especially heartened by its capture of many mayoralties from the Democrats in industrial cities in the east and middle west. These indicated that high taxes and high prices had hurt the Democrats among labour and white-collar elements.

The congressional coalition of Republicans and southern Democrats continued blocking bills on civil rights, compulsory health insurance, the Brannan farm plan, federal aid to education, etc. The combination granted only $5,691,000,000 in new taxes, as against an original White House request for $16,500,000,000, subsequently reduced to $10,000,000,000.

On foreign affairs and national defense, the minority generally accepted administration proposals, although with strings attached. In appropriating for overseas military and economic aid, they fixed a specific allocation of the funds. They also stipulated that no more than six divisions might be shipped to Europe without prior consent from congress.

Although the Republicans were fortunate in that Democratic congressmen assumed responsibility for initiating numerous investigations of alleged corruption, maladministration and laxity in several executive agencies, the minority made capital of disclosures of political favouritism and collusion in the Reconstruction Finance corporation, the department of justice and the internal revenue bureau.

Sen. Joseph R. McCarthy's resumption of his 1950 attacks on alleged Communists in the state department, and especially his floor denunciation of Gen. George C. Marshall before the latter's retirement as secretary of defense, caused misgivings among several colleagues. Headed by Sen. Margaret Chase Smith of Maine, several Republican senators issued a statement indirectly condemning the McCarthy technique as "un-American." Sen. William Benton, Connecticut Democrat, introduced a resolution for McCarthy's expulsion, on which hearings were begun late in the year.

A split developed on foreign policy, with a possible bearing on 1952 candidates and platform. One group, consisting largely of congressmen from eastern states, favoured all-out aid to Europe. Another faction, headed by Sen. Robert A. Taft of Ohio, while favouring limited aid to Europe, insisted that the administration devote more thought and resources to "containing" the U.S.S.R. in the far east.

Rep. Joseph W. Martin, Jr., of Massachusetts, house minority leader, helped precipitate a politico-military controversy by making public a letter from Gen. Douglas MacArthur, in which the latter questioned the administration's program in the Korean conflict and the far east generally. Ousted in April by President Truman, MacArthur returned to the United States to receive a hero's welcome from congress, several cities and state legislatures. Subsequently, he delivered speeches criticizing "internal subversion, corruption and detailed regimentation" at Washington, D.C.

The division between the "internationalists" and "isolationists," although both factions repudiated those characterizations, soon developed into a squaring-off over 1952 candidates. It resulted in an open skirmish between the forces of Senator Taft, who announced his candidacy in early fall, and backers of Gen. Dwight D. Eisenhower, commander of the western European army by appointment of President Truman.

Although Eisenhower's military assignment seemed to prevent him from entering the race, up to the end of 1951, or even disclosing his political affiliations, distinguished Republicans organized on his behalf. The principal promoters were Gov. Thomas E. Dewey of New York, Sen. James H. Duff of Pennsylvania, Sen. Henry Cabot Lodge of Massachusetts and National Committeeman Harry Darby of Kansas.

Another hat was thrown into the ring when Gov. Earl Warren, the 1948 vice-presidential nominee, announced that he was in the running, and shortly afterward Harold E. Stassen, former Minnesota governor and president of the University of Pennsylvania, also indicated that he would seek the nomination.

Sen. Karl E. Mundt of South Dakota proposed a formal alliance of Republicans and conservative southern Democrats that would project their Capitol hill tieup into the political realm, but he made small progress. However, in the summer the Republican national committee held its first meeting below the Mason-Dixon line, at Tulsa, Okla., at which time it chose Chicago, Ill. as the 1952 convention site.

The G.O.P. had a slight intra-family difficulty, involving National Chairman Guy G. Gabrielson. When the Fulbright inquiry disclosed that he had obtained a Reconstruction Finance corporation loan of $18,500,000 for his firm, Carthage Hydrocol, Inc., Sen. Richard H. Nixon of California demanded his resignation. Gabrielson refused on the ground that he had obtained the funds before he took his political post, and he was generally backed by committee members. Respiratory Diseases.

In 1951, most cases of pneumonia were still loosely termed "viral" or, even more indefinitely, "primary atypical." The relative proportion of bacterial pneumonias (mostly caused by the pneumococcus) and of primary atypical pneumonias had varied in different years and localities. The number of cases ascribable to known microbial agents other than bacteria remained relatively small except in areas where Q fever was prevalent.

R. F. Reimann, investigating the "changing nature of pneumonia," found that at least some of the alleged change was more apparent than real. The number of cases of pneumonia reported in Philadelphia, Pa., for instance, had fluctuated only little during the period from 1930 to 1948 although there had been a striking downward trend in the mortality. In one large Philadelphia hospital, the number of cases specifically identified as pneumococcal pneumonia per 1,000 admissions for all causes was almost identical in the years 1937 through 1939 before effective sulfonamides were widely used, and again from Oct. 1946 to Oct. 1949, after penicillin had come into regular use.

Other clinicians in large hospitals of various U.S. cities

Case Fatality Rates in Pneumococcic Pneumonia According to Age of Patients and Method of Treatment

	No Specific Treatment			Treated with Specific Serum			Treated with Sulfonamides			Treated with Penicillin, Aureomycin or Terramycin		
Age Group	No.	Died	% Died	No.	Died	% Died	No.	Died	% Died	No.	Died	% Died
10 to 19	115	3	3	121	2	2	116	3	3	64	1	2
20 to 29	172	20	11	170	7	4	279	9	3	162	2	1
30 to 39	216	45	21	247	30	12	357	34	10	251	8	3

All cases	1,087	331	30.5	889	150	16.9	1,274	157	12.3	920	47	5.1

Reported by H. F. Dowling and M. H. Lepper, *Am. J. M. Sc.*, 222:397 (Oct. 1951).

were quoted by Reimann as indicating that the number of patients with lobar (pneumococcal) pneumonia had not changed materially from the presulfonamide era. The severity of these cases, as judged at least by the percentage of those whose blood had been invaded by the pneumococcus, likewise was about the same as before the sulfonamides became available. Moreover, in South Africa, where pneumonia is always highly prevalent among miners, an actual increase in cases of lobar pneumonia was reported.

The situation with respect to deaths from pneumonia, however, was quite different; the mortality rate had been showing a slow but steady decline since the time of the pandemic of influenza in 1918. This downward trend was accelerated after 1936; in Philadelphia, for example, the number of annual deaths declined from more than 2,000 in 1936 and preceding years to between 1,100 and 1,250 in 1940–44 and subsequently to about 750 in 1948.

Data on fatality rates (number of deaths per 1000 hospitalized patients with pneumonia) reflected more clearly the effects of the new specific treatments. At the Cincinnati General hospital, for example, mortality from pneumococcal pneumonia ranged between 37% and 28% in the period 1936–39, inclusive, when only specific serums were used and only a relatively small proportion of the cases were treated with such serums. From 1940 to 1945, when sulfonamides were used in all cases, the fatality rate ranged between 14% and 20%. After 1949, when penicillin and other antibiotics were employed in the treatment of all cases, the mortality dropped to between 6.5% and 10%.

Even more revealing were the data collected by H. F. Dowling and M. H. Lepper, reproduced in the accompanying table. Their figures also showed the progressive decline in the fatality rate of pneumococcal pneumonia. They also showed that the benefit from the various treatments was shared by all age groups, although perhaps not equally for each group and each type of treatment. There was still a significant mortality from pneumonia in persons over 50 and particularly over 60.

The choice of treatment among the antibiotics (penicillin, aureomycin, terramycin and chloramphenicol) was still difficult to evaluate in 1951 because all appeared to be about equally effective in the pneumococcal pneumonias. Variable results, however, had been reported from the treatment of pneumonias caused by other agents, but the numbers of such cases were not adequate for valid comparisons.

Little was added to knowledge of the so-called primary atypical (viral) pneumonias in 1951. In one large hospital it was shown that cases of this disease had been recognized in significant though somewhat varying numbers in each of the four successive years preceding the report. The seasonal incidence, however, was similar in each of these years; it was high during the summer months, reached a peak during the autumn, dropped to or below the summer level during the winter and had its lowest incidence during the spring months. (Pneumococcal pneumonias reached their peak of incidence in the winter, and the fewest cases were in the summer months.)

Most, although by no means all, investigators who had studied the effects of antibiotics on the course of "viral" pneumonias had found that aureomycin, in particular, and perhaps also terramycin and chloramphenicol, have a significant beneficial effect in alleviating the symptoms and shortening the course of the disease. The results of a study reported from a U.S. air force base, however, were interpreted as indicating that none of the antibiotics exert any significant beneficial effect upon the duration of the illness in the mild disease. The cases reported, however, must have been unusually mild, since the patients had fever for an average of only one and one-half to three days in each of the various therapeutic groups, including those who received no therapy. These patients must, therefore, have had an illness that was far different from the types observed in patients in whom the beneficial effects of aureomycin had been previously demonstrated; in the latter, the average duration of fever and symptoms without treatment, or with penicillin, was usually from 10 to 14 days.

NEW MILL HILL LABORATORY in London, Eng., centre of the World Health organization's 1951 campaign against influenza, in which eggs were employed in checking for the presence of the virus and for testing experimental vaccines

Q fever continued to arouse considerable interest. The results of epidemiologic studies conducted in 300 cases of this disease and among 10,000 persons in selected population groups in the Los Angeles area of California were reported in 1951. Together with previous studies they indicated that the major factor in the spread of this disease to man is association with infected livestock. They showed that dairy cattle and some of their raw products were the most frequent sources of human infection in this area. Persons most likely to become infected are those with occupational exposure to livestock, those who live near dairies or livestock yards and those who use raw milk. It was concluded from these studies that although universal pasteurization of milk would help prevent some infections, and the vaccination of occupationally exposed groups might afford protection to those groups, effective control of the disease in man had to await the development of measures for the control of the infection in the animal sources of the disease.

Another series of intensive studies on Q fever was also reported from California. One involved an investigation of blood serums from more than 16,000 sheep, goats and cattle from that state for evidence of infection with Rickettsia. Antibodies for this agent, *Coxiella burneti*, were found to vary in distribution in these three species in two major geographic areas. In northern California the highest prevalence of antibodies was encountered in sheep and goats while in southern California the highest incidence of antibodies was encountered in dairy cattle and goats. These findings agreed with the results of epidemiological observations of human Q fever which indicated that the majority of cases in southern California had a history of contact with dairy cattle, whereas in northern California, such contact was with sheep and goats.

In this connection it is of interest that *Coxiella burneti*, the causal Rickettsia of Q fever, was isolated from the air of a shed in a commercial goatery in southern California. An outbreak of the disease was also described among the crew of a trans-Pacific ship which carried successive cargoes of pregnant dairy goats. From 15% to 32% of the goats examined had antibodies in their blood which indicated recent infection with *Coxiella burneti*. The evidence pointed to the goats as possible sources of infection of the crew.

An outbreak of Q fever involving 68 persons at an agricultural college in California was also described. The source or mode of transmission of the infection was not determined with certainty, but the evidence pointed to sheep as the probable source. Most of the human cases were in students of animal husbandry, suggesting that the disease was acquired through more or less direct contact with infected animals. In some cases, however, the possibility of airborne transmission was considered.

Clinical studies of 180 cases in northern California indicated that Q fever is a systemic disease of varying duration and severity, the fever not infrequently lasting for more than three weeks, especially in older people. Evidence of pneumonia was not found frequently and changes in the lungs were demonstrated by X-ray in only one-third of the patients examined.

The results of treating Q fever with aureomycin were compared with those obtained by the use of penicillin. Aureomycin appeared to bring about a significant reduction in the duration of fever and was considered to be highly beneficial, whereas penicillin probably was not. In some patients, however, the response to aureomycin appeared to be slight or negligible and no explanation was found for these failures.

Mention may also be made of an epidemic of psittacosis (ornithosis) in Texas. This disease previously had been associated with exposure to sick parrots, or later to pigeons and other types of fowl. The outbreak reported in 1951 occurred among employees of a poultry and egg plant. Of 78 employees in one establishment engaged in dressing turkeys for market, 22 acquired the disease and 3 died. Epidemiologic studies revealed that a group of turkeys constituted the most probable source of infection.

Some investigations were made during 1951 of the effects of cortisone and ACTH in the treatment of pneumonia. The studies indicated that the symptoms of pneumonia may be temporarily alleviated but the infection itself is apparently unaffected and may progress during treatment. Experimental infections in animals are not benefited and treatment with ACTH or cortisone may even be associated with increased severity and mortality. There were increasing numbers of reports, however, indicating that all types of human infection may actually be aggravated or initiated during treatment with ACTH and cortisone.

Réunion.

The status of this former French island colony in the Indian ocean (about 420 mi. east of Madagascar) was changed in 1946 to that of an overseas *département*. Area: 970 sq.mi. Pop.: (1950 est.) 255,000; (1946 census) 242,067, of whom 97% were French subjects but only 6,698 were of French origin. The inhabitants are mainly coloured (Negroes, creoles, mulattoes, Indians and Chinese), speak a creole patois and are mainly Roman Catholic. Chief towns (pop., 1946 census): Saint-Denis (cap., 36,096); Saint-Louis (23,936); Saint-Paul (25,959); Saint-Pierre (22,379). Prefect: Roland Béchoff.

History.—The elections of June 17, 1951, sent one Communist and two Republican deputies to the National assembly in Paris. Nine Independents, four Gaullists, two Communists and two Christian Democrats were elected to the general council of the island. Sugar cane planters protested against the island's being made a *département* because this incurred social obligations which increased cost prices. There was a proposal to restrict the area devoted to sugar cane and to concentrate sugar factories. The quota of sugar to be admitted to France was limited to 150,000 metric tons, that of rum to 30,000 hectolitres. The slackening of demand in France was leading to a bottleneck in production. The S.A.P.M.E.R. Company, founded on Réunion to exploit the fisheries in the vicinity of Saint-Paul and Amsterdam islands, in 1950 landed 147 metric tons of false cod and 70 metric tons of crayfish tails.

Finance.—Currency: Fr. C.F.A. (Colonies Françaises d'Afrique) = 2 metropolitan francs. U. S. \$1 = 350 metropolitan francs.

Foreign Trade.—(1950): imports 4,578,000,000 fr. C.F.A.; exports 3,320,000,000 fr. C.F.A. Principal exports: sugar 2,327,000,000 fr.; rum 317,000,000 fr.; vegetable oils 266,000,000 fr. Trade is almost entirely with the French Union.

Transport and Communications.—(1950): Railways 227 km.; roads 2,000 km.; motor vehicles 5,900. (HU. DE.)

Rheumatic Diseases.

Efforts were extended during 1951 to learn how the hormones cortisone (the adrenal cortical hormone) and corticotropin (ACTH—the adrenal stimulating secretion of the pituitary gland) produce their effects, but with little success. The usefulness of these hormones in practical management of patients with different forms of arthritis was explored extensively. The biggest problems in this field are met in patients with rheumatoid arthritis because this is a chronic disease. These hormones do not obliterate the underlying disease mechanism; they only suppress it. Hence, to benefit this chronic disease one is faced with the need for prolonged use of the hormone, and with the problems of avoiding troubles during hormone administration. Trials of various schedules of treatment were critically evaluated with the result that most investigators agreed that smaller doses than were used in the early trials, sufficient to produce partial but not complete suppression of the disease, continued over many months, was usually the best plan. Many persons were significantly helped and fewer difficulties were encountered when this plan was followed. The duration of treatment must be determined separately in each case according to the comparison of the degree of benefit, how well the patient gets on when trials to discontinue treatment are made, and the amount of undesired effects of the hormone. Many patients got on well without cortisone or corticotropin; some could not tolerate the use of the amounts required to produce good anti-rheumatic effect; many could be helped greatly by the hormones. Much attention was being given to the wise selection of patients as candidates for such treatment.

In addition to the use of cortisone and corticotropin in severe, progressive cases of rheumatoid arthritis, the drugs were found to have significant value in the rehabilitation of patients who had been incapacitated from long-standing disease.

Perfection of a much better and more reliable delayed-absorbing corticotropin made the use of this hormone more practical and more popular. Even so, it was far less adaptable than cortisone (which could be used in tablet form) in the management of ambulatory (non-hospitalized) patients. Production of both hormones increased during the year so that the needs were usually met. (*See* also CORTISONE AND ACTH.)

Patients with severe osteoarthritis, especially of the hip joints, were made comfortable and rehabilitated by prolonged use of cortisone, with little or no trouble even in elderly patients. Cortisone used in this disease can be only ameliorating, for the underlying pathologic changes are irreversible.

A "sister-steroid" to cortisone, namely hydrocortisone (compound F) was found to possess essentially the same pharmacologic characteristics as cortisone. It has no advantages over cortisone for usual oral or intramuscular use, but early studies indicated that it has greater effects when injected directly into the joint cavity of an inflamed or painful joint. Injections had to be repeated at intervals of from 7 to 50 days. The much smaller amount of steroid required together with the avoidance of troubles which sometimes accompany systemic use of such steroids, made further study of this method of local use of hydrocortisone attractive.

The revival of an interesting theory of the cause for rheumatoid arthritis was presented by T. M. Brown and associates, who pointed out that certain bacteria might be responsible for this disease, indirectly through immune reactions. Based upon this premise, slow elimination of the organisms by long use of small, daily doses of terramycin (an antibiotic to which the bacteria are sensitive) was tried, and a preliminary report was made that such treatment seemed to be effective. However, much more study of this approach to treatment was needed before its value could be ascertained.

Numerous investigators showed that a new drug, benemid, in proper doses, increases the urinary excretion of uric acid, and thereby reduces the content of uric acid in the blood. This effect was expected to be of great value to patients with gout —a disease with alteration of uric acid metabolism. Indeed in many patients with gout, lowering of the blood uric acid was consistently effected. Whether or not this would reduce or eliminate the attacks of arthritis which characterize gout could be determined only after longer study.

Investigations in arthritis and related fields were expected to continue and increase. Developments in this direction were being made possible through the support of the newly formed Arthritis and Rheumatism foundation. Also the United States public health service had provided increasing stimulus and aid to arthritis research, especially through its newly organized Institute for Arthritis and Metabolic Diseases. (R. H. FR.)

Rhode Island. A north Atlantic state of the United States, in New England, Rhode Island was one of the 13 original states; it is popularly known as "Little Rhody." Area: 1,214 sq.mi. (smallest of the United States), including 157 sq.mi. of water. Pop. (1950 census): 791,896, a gain of 11% since 1940. The principal cities, with 1950 populations, were: Providence (cap., 248,674); Pawtucket (81,436); Woonsocket (50,211); Cranston (55,060); Warwick (43,028); Newport (37,564); Central Falls (23,550).

History.—At the 1951 session of the legislature, leading measures passed included the following: a general appropriations act for support of the government for the fiscal year ending June 30, 1952, to the amount of $48,970,869.68; an act to provide additional revenue for the ensuing fiscal year for the state and its municipalities by doubling the 1% sales tax, increasing the corporate income tax from 4% to 5%, raising the tax on pari-mutuel betting from 5% to 7% and placing an excise tax of 50 cents per gallon on alcoholic beverages; an act creating a state board of education consisting of seven members to be appointed by the governor; an act providing for a special election on the question of calling a constitutional convention for the limited purpose of proposing amendments to the constitution on these subjects: permanent registration of voters, qualification of voters (veterans' exemptions), increasing compensation of state legislators, repeal of poll tax, life tenure for judges of the supreme and superior courts, home rule for cities and towns, increase of borrowing power of the state, redevelopment of blighted areas and requirement of off-street parking in cities and towns, and also providing for a subsequent special election for ratification of action of the constitutional convention by the electorate; an act to approve for the second time and submit to the voters an amendment to the constitution for abolishing the poll tax; an act reducing from 15 to 12 weeks the duration of benefit payments under the cash sickness compensation act, for unemployment due to sickness resulting from pregnancy, with provision for lifting the limitation in cases of unusual complications; an act to provide for a retirement and benefit system for municipal employees and its integration with the federal Social Security act; an act for the regulation and restriction of evictions of tenants; an act extending veterans' benefits to members of the armed forces who have had part in the Korean war; an act to promote housing for persons engaged in national defense activities; and an act creating a commission to make a complete revision of the workmen's compensation laws and to draft an act for submission to the legislature at its 1952 session.

The chief executive officers of the state elected in Nov. 1950 for 1951–52 were Dennis J. Roberts, governor; John S. McKiernan, lieutenant governor; Armand H. Coté, secretary of state; William E. Powers, attorney general; Raymond H. Hawksley, general treasurer. Edmund W. Flynn was chief justice of the supreme court.

Education.—During 1950–51 there were in the public elementary schools 63,844 pupils and 2,181 teachers; in junior high schools 16,526 pupils and 851 teachers; in senior high schools (three years) 12,039 pupils and 703 teachers; in senior high schools (four years and vocational) 4,711 pupils and 243 teachers. Pupils attending private schools were: elementary 27,690; junior high 4,547; senior high (three years) 923; senior high (four years) 6,060. The total number of teachers in private day schools was 1,426. Current expenditures for day schools were $20,429,017.71 and for evening schools $66,601.87. The commissioner of education in 1951 was Michael F. Walsh, working under the newly created state board of education of seven members whose chairman was C. B. Collins.

Social Insurance and Assistance, Public Welfare and Related Programs.—The total number of persons receiving public assistance in all categories (including incapacitated fathers) in Nov. 1951 was 33,079 or about 4.2% of the state's population. The total amounts paid out during the year Dec. 1, 1950, to Nov. 30, 1951, were as follows: general public assistance $3,555,826; soldiers' welfare $149,742; old-age assistance $5,355,692; aid to dependent children $3,601,578; aid to the blind $120,356; aid to the disabled (started in May 1951 and matched by federal payments) $35,448. In unemployment compensation, the net amount of benefit payments during 1951 was $17,408,018.42 to 83,544 different individuals. The amount paid into the fund during 1951 including interest was $17,101,106.80. There were 553 inmates in corrective institutions on Nov. 30, 1951, and 5,713 patients in charitable institutions and institutions for defectives, the number in the latter being 4,209.

Communications.—The total mileage for highways on Dec. 31, 1951 (excluding city roads and streets under the control of the seven cities), was 2,622 mi. of which 842.29 mi. were state roads built and maintained by the state into and through the cities. At the close of 1950, railroads were operating 184.76 mi. of track in the state.

Water-borne commerce of the state for 1950 was 8,379,590 tons, of which 827,800 tons were foreign commerce (imports 827,703 tons, exports 97 tons), 7,007,778 tons were coastwise (receipts 6,396,427 tons, shipments 611,351 tons), 405,364 tons were internal (receipts 202,682 tons, shipment 202,682 tons) and 138,648 tons were local.

On Dec. 31, 1951, there were four publicly owned (state) airports and seven privately owned airports or landing fields. Also there were two naval air stations owned by the United States.

In Dec. 1951 there were 241,434 telephones in service.

Banking and Finance.—There were 25 banking institutions in 1951. Resources of 18 banks under state supervision totalled $788,025,447.84, and of 7 banks under federal supervision, $373,044,990.03. Savings deposits (exclusive of club accounts) in savings banks and trust companies (the 18 state banks) amounted to $497,617,646 on June 30, 1951. In addition, 6 loan and investment companies had resources of $5,218,949.67; 7 building and loan associations $97,045,350.42; 41 credit unions $20,638,337.71.

At the close of the fiscal year, June 30, 1951, total state receipts were $51,642,430.32; expenditures and encumbrances $50,925,028.20; surplus from operation $717,402.12. The state gross debt was $52,617,000, net debt $47,302,975.58.

Agriculture.—The total acreage of principal crops harvested was 52,200 in 1951. Cash income from crops in 1950 was $5,248,000; from livestock and livestock products $16,407,000; from government payments $96,000; total gross farm income $21,751,000. The value of livestock Jan. 1, 1951, was $8,374,000.

Leading Agricultural Products of Rhode Island

Crop	1951	1950	Average 1940-49
Corn, all, bu.	287,000	301,000	309,000
Hay, all, tons	49,000	44,000	50,000
Alfalfa, tons	2,000	2,000	2,000
Potatoes, bu.	1,060,000	1,210,000	1,263,000
Oats, bu.	32,000	31,000	32,000
Apples (commercial), bu.	243,000	261,000	212,000
Peaches, bu.	18,000	3,000	14,000

Source: U.S. Department of Agriculture.

On Jan. 1, 1951, the livestock population of the state included: 1,000 horses and colts; 21,000 milk cows; 6,000 other cattle; 9,000 hogs; 2,000 sheep and lambs; 638,000 chickens; 5,000 turkeys; and 1,100 colonies of bees. Livestock products in 1950 included 138,000,000 lb. of milk valued at $8,156,000; 940,000 chickens, $2,075,000; 34,000 turkeys, $300,000; 8,500,000 doz. eggs, $4,394,000.

Industry and Manufacturing.—The estimated number employed in the state in Nov. 1951 was 292,000, distributed as follows: manufacturing 140,700; trade (wholesale and retail) 52,600; government (federal, state, local) 33,300; service (personal, medical, legal, etc.) 22,300; transportation and public utilities 15,200; construction 16,700; finance, insurance, real estate 10,500; miscellaneous 700. (Farmers, self-employed, domestics and armed services personnel are excluded.)

Employment in manufacturing in Nov. 1951 totalled 120,766 production wage earners and 19,895 nonproduction workers (salaried personnel), and the weekly pay roll was $6,716,891 for all manufacturing industries in Rhode Island according to the state department of labour. Wage earners were distributed among manufacturing industries as follows: textiles 54,796 (cotton 14,408, rayon-silk 3,639, woollen-worsted 21,988, finishing 10,208, miscellaneous textiles 4,553); jewellery-silverware 17,844; metals and machinery 34,210 (primary 6,867, fabricated 5,694, machinery 13,815, electrical machinery 7,834); rubber products 7,073; apparel 3,012; food 4,457; miscellaneous 19,269. The number of establishments employing five or more workers was 3,739 in Oct. 1951, and the number of persons employed was 203,833. (M. C. Ml.)

Mineral Production.—Rhode Island's mineral production is limited mainly to building materials. In 1949 it included 398,487 short tons of sand and gravel (valued at $378,896), 74,670 tons of stone ($451,029) and other nonmetallics valued at $98,760; total value $928,685. In 1950 sand and gravel increased to 579,528 tons ($580,322) and stone to 239,400 tons ($798,186).

Rhodesia, Northern.

A British protectorate in central Africa. Area: 290,320 sq.mi. Pop. (June 1950 est.): 1,866,000, including 38,000 Europeans. Religion: pagan (*c.* 80%) and Christian. Chief towns (European pop. 1950): Lusaka (cap. 4,615), Nkana-Kitwe (5,234), Luanshya (4,685), Mufulira (3,322), Ndola (2,962). Administration: governor; executive council, 7 official and 4 unofficial members; legislative council, 9 official members and 14 unofficial (10 elected European, 2 nominated to represent African interests and 2 African). Governor: Sir Gilbert Rennie.

History.—Proposals for federating the Rhodesias and Nyasaland produced by a conference of officials in London earlier in 1951 were discussed at Victoria Falls in September. African opinion in Northern Rhodesia was solidly against any form of federation but the African representatives from the protectorate indicated at Victoria Falls that they would be ready to consider federation after the policy of partnership should have been defined and, as defined, put into progressive operation. Sir Gilbert Rennie, the governor, Roy Welensky, leader of the unofficial members of the legislature, and J. B. Beckett, member for agriculture, had discussions in London in April with James Griffiths, secretary for the colonies, on the Northern Rhodesian constitution, but no decision was obtained.

A report on the Kariba gorge hydroelectric scheme by the Central African council recommended initial construction to produce 380,000 kw. at a cost of £43,518,000 with ultimate expansion to 1,000,000 kw. at a cost of £74,500,000. The creation of a Zambezi river authority and a Rhodesian hydroelectric board was also proposed. The government issued £7,730,000 3½% inscribed stock 1970–72 at £99% for development work. A loan of £3,000,000 was made by the Economic Cooperation administration for copper mining development. A threatened strike of 30,000 African mineworkers was averted by wage concessions. The co-operative movement made great progress reaching a total of 64 African societies with 10,364 members and a capital of £18,429.

Education.—Government schools (1949): 16, of which 11 provided a limited secondary course (attendance 3,730); controlled private schools, attendance 858; convent school at Broken Hill provided full secondary course.

Finance and Trade.—Currency: Southern Rhodesian pound at par with sterling. Budget: (1950 actual) revenue £11,758,324, expenditure £11,676,248; (1951 est.) revenue £14,417,630, expenditure £14,375,310. Foreign trade (1950): imports £26,710,000; exports £49,942,000. Principal exports (1950 values): copper (blister and electrolytic) £42,857,000, lead £1,334,208, zinc £2,630,533, tobacco £1,004,222. (*See* also RHODESIA, SOUTHERN.) (G. R. Mn.)

Rhodesia, Southern.

A self-governing British colony in central Africa, Southern Rhodesia is separated from Northern Rhodesia by the Zambezi river and is bounded northeast and east by Portuguese East Africa, south by Transvaal and southwest and west by Bechuanaland protectorate. Area: 150,333 sq.mi. Pop. (1951 census): 2,146,324 including 136,017 Europeans, 4,343 Asians and 5,964 mixed. Chief towns (European pop.): Salisbury (cap., 40,510); Bulawayo (32,269); Umtali (5,762); Gwelo (5,115). Languages: English, Afrikaans and tribal dialects. Religion: Africans mainly pagan, Christian minority. Administration: governor; executive council (cabinet); legislative assembly, in which seats were held (Dec. 1951) as follows: United party 23, Rhodesia (former Liberal) party 5, Rhodesia Labour party 2. Governor, Maj. Gen. Sir John Noble Kennedy; prime minister, Sir Godfrey Huggins.

History.—Defense measures taken during 1951 included the registration of all non-African males between the ages of 18 and 29 for six weeks' training in camp; the raising of an additional company of the Rhodesian African Rifles; a short service commissions scheme to train fighter pilots for two complete squadrons in two years; and an expenditure of £2,000,000 on building up strategic stocks. The educational test for the franchise was stiffened; the property qualification was raised to £500 and the income qualification to £240 a year. The Liberal party changed its name to the Rhodesia party and a new political organization called the Democratic party was formed, mainly with Afrikaner support. R. F. Halsted, minister for trade and industrial development was dropped from the cabinet after failures in gasoline supplies. A report on agriculture by Sir Frank Engledow was published. In January the government issued £5,000,000 3½*s.* 1980–85 at par; 43% was left with the underwriters. The United States granted a loan of £5,000,000 for Rhodesia railways through the Economic Cooperation administration.

Central African Federation.—Proposals for a closer association of Southern Rhodesia, Northern Rhodesia and Nyasaland (*qq.v.*) had been discussed for a number of years. The issue was complicated by the differing status of the territories, Southern Rhodesia being a self-governing colony and the other territories protectorates. The presence of permanently resident and landowning European groups distinguished the territories from others in Africa in which Africans had made rapid constitutional progress. In all the territories attempts were being made to work out a constitutional partnership between the elements of a plural society, but the directions taken were different. In the north considerable constitutional advances, in which the African had a substantial place, had been made by 1951; in Southern Rhodesia the emphasis was placed on African economic and educational advancement as an essential preliminary to increased participation in government. A royal commission in 1938 had considered closer association but recommended at that time only an interterritorial advisory body which came into being in 1945, after being delayed by World War II, as the Central African council. This was reduced in 1951 to a secretariat.

Informal discussions took place in 1949 between Southern Rhodesian leaders and the unofficial members of the Northern Rhodesian legislature. A conference of officials met in London in March 1951 to examine the matter afresh. Its report was published in June and was accompanied by a comparative survey of native policies. The survey found that the principles of policy, of leading the African to full partnership, did not materially differ between the northern territories and Southern Rhodesia; the main difference was that it was held in the north that the African must be induced from the outset to play a full part in the administration of his own area and a direct part in the politics of the whole territory, whereas in Southern Rhodesia it was held that he must first become the equal of his future partner—the European—in health, material well-being and education.

The officials' report emphasized the interdependent nature of the economies of the territories (*e.g.*, Southern Rhodesian coal for Northern Rhodesian copper smelting) and pointed out that a slump in any one of a few commodities would have a disastrous effect on the territories working as isolated units. The economic development of all had gone forward rapidly in ten years and the European population had more than doubled. Differences in native policy could no longer be regarded as a valid argument against closer association; African opinion in the north was still opposed to it, which was a serious obstacle, but in the last resort, the officials thought, and given adequate representation and protection of their interests, the Africans would come to realize its advantages from their point of view.

The report therefore proposed a federation, to be called British Central Africa. The federal authority would control external affairs, defense, economic matters and the principal public utility services, while the territories would control most other matters, in particular those most affecting the African. But African interests would also be watched in the federal sphere by a minister responsible ultimately to the United Kingdom government. Africans would also have representation in the legislature.

The proposals were discussed by representatives from the three territories with James Griffiths, secretary for the colonies, and Patrick Gordon Walker, secretary for commonwealth relations, at Victoria falls, Sept. 18–21. The Africans from the north opposed them, according to the communiqué issued Sept. 21, but the other interests accepted federation in principle. The Conservative government which took office in London in October announced on Nov. 21 that it endorsed federation and believed it to be in the best interests of the Africans; assurances given by earlier governments were renewed; amalgamation, except by majority consent, was ruled out; and it was proposed that the conference reassemble in London in July 1952.

The course of events caused much disappointment in Southern Rhodesia. Sir Godfrey Huggins, the prime minister, explained in parliament on Nov. 19 that he had always wanted amalgamation but, as it was unattainable, accepted federation in principle. (*See* also RHODESIA, NORTHERN.)

Education.—European (1950): government primary schools 76, teachers 527, pupils 14,254; high schools 15, teachers 333, pupils 5,011; private registered schools 11; aided European schools 10, teachers 196, pupils 3,755; aided farm schools 12, teachers 12, pupils 172. Asian and mixed: government schools 12, teachers 65, pupils 1,815; other schools 5, teachers 33, pupils 994. African: government primary schools 9, teachers 5 European and 126 African, pupils 4,477; aided primary schools 2,133, teachers 8 European and 5,980 African, pupils 212,184; government post primary schools 3, teachers 19 European and 31 African, pupils 854; aided post primary schools 10, teachers 27 European and 9 African, pupils 506; aided teacher training schools 19, teachers 85, students 944.

Finance and Banking.—Currency: Southern Rhodesian pound (£SR1 = £1 sterling); circulation incl. Northern Rhodesia and Nyasaland (June 1951) £11,109,000. Budget (1950–51): revenue £17,997,385; expenditure £16,736,780; (1951–52 est.) revenue £20,885,200, expenditure £21,901,326. National debt (March 1951) £91,614,059. National income (1950 est.) £89,100,000.

Foreign Trade.—Imports (1950) £58,875,000, exports £40,754,000, re-exports £7,500,000; (Jan.–June 1951) imports £38,934,000, exports £19,578,000, re-exports £4,389,000.

Transport and Communications.—Main roads (1950): *c.* 15,600 mi., incl. 2,500 mi. hard-surfaced. Railways: 1,352 mi.; (1950) passenger traffic 2,368,017, freight 6,001,496 tons.

Agriculture.—Tobacco (Virginia, 1950–51): 89,431,985 lb.

Industry.—Fuel and power: coal (1950) 2,346,000 tons, (Jan.–June 1951) 1,209,000 tons; electricity (1950) 219,159,417 units sold. Raw materials (1950): gold 511,000 oz.; asbestos 71,527 tons; chrome 321,353 tons. (G. R. MN.)

Rice. The 1951 U.S. rice crop of 43,805,000 bags (100 lb. each) was 7% larger than the previous record crop (1949), 13% larger than the 38,689,000 bags of 1950 and about one-third larger than the 1940–49 average (31,431,000 bags). The record crop resulted from a 20% increase in harvested acreage, 1,947,000 ac., compared with 1,620,000 ac. in 1950. An average yield of 2,250 lb. per acre fell below the 2,388 lb. of 1950 but exceeded the 2,083-lb. average of 1940–49.

Texas ranked first among the states with 12,408,000 bags, followed by Louisiana with 11,324,000, California with 10,362,000 and Arkansas with 9,011,000 bags.

The probable average price to farmers was estimated at $4.77 per bag, compared with a government loan level of $5, whereas the 1950 price received averaged $5.09. Exports for the year were estimated at 18,000,000 bags, compared with 13,167,000 bags in 1950.

The world rice crop for 1951–52 was preliminarily estimated at 337,387,500,000 lb., compared with 339,644,300,000 lb. in 1950–51 and about 335,700,000,000 lb. before World War II. Planted acreage was near the record of the previous year (233,220,000 ac.) and well above the 211,547,000 ac. of prewar; the decline was mostly the result of unfavourable weather in China

Rice Production of the Principal Producing Countries

(In millions of pounds; rough)

Country	1951–52	1950–51	Average, 1935–36 1939–40
China	99,000	103,500	110,372
India	—	70,000	74,740
Pakistan	27,740	27,560	24,340
Japan	25,000	26,443	26,791
Thailand	14,500	14,951	9,589
Malayan federation	—	14,280	14,126
Indochina	12,500	12,000	14,396
Burma	11,800	11,505	15,683

and Japan. World exports of rice increased to a level about half as large as the prewar level, which was about 20,000,000,000 lb. of milled rice per year. (J. K. R.)

Ridgway, Matthew Bunker

(1895–), U.S. general, was born on March 3 at Fort Monroe, Va. He graduated from the U.S. Military academy at West Point in 1917, and was assigned as an instructor at West Point during World War I. He later saw service in China, Nicaragua and the Philippines, and at the outbreak of World War II was serving in the war plans division of the war department in Washington, D.C. He was given command of the 82nd infantry division, which was later converted into an airborne division, and which he led in invasions of Sicily in 1943 and Normandy in 1944. When World War II ended he was in the Philippines, participating in the arrangements for the invasion of Japan. He was Gen. Dwight D. Eisenhower's representative on the United Nations Military Staff committee in 1946; U.S. Caribbean commander in 1948, and was serving as deputy chief of staff for administration when he was called to replace Lt. Gen. Walton H. Walker when the latter was killed in Korea, Dec. 1950. As commander of the U.S. 8th army, he engineered the U.N. forces' comeback against the North Koreans. When Pres. Harry S. Truman dismissed General Douglas MacArthur, April 11, 1951, he named General Ridgway to succeed to the four commands: supreme commander, Allied powers, and as such chief of the Japanese occupation; commander in chief, U.N. command in Korea; commander in chief, far east (U.S.), and commanding general U.S. army, far east. It was under General Ridgway that the prolonged truce talks began in July. He repeatedly asserted thereafter that while he steadily worked for peace, his forces were ever alert to repel any further attacks by Communists in Korea.

Rio Muni: *see* SPANISH COLONIAL EMPIRE.

Rivers and Harbours.

In 1951 construction was executed on 150 regular river and harbour projects by the U.S. army corps of engineers; of this number 23 were completed. Maintenance was performed on a total of 330 projects, including the extensive intercoastal waterways and Mississippi river system, the connecting channels on the Great Lakes, the 490 navigation locks and dams and 270 harbours, and also the channels and canals of the Ohio river system, the upper Mississippi river, the Illinois waterway, the hydroelectric generating plants on the Missouri river at Fort Peck, Mont., and the Columbia river at Bonneville, Ore. During the fiscal year which ended June 30, 1951, $186,142,500 of federal funds was expended for new work and maintenance of river and navigation projects and inland and coastal harbours.

The Rivers and Harbors act of 1951, including supplemental appropriations, provided $192,657,613 for maintenance and improvement of U.S. rivers and harbours. Of this total, $125,192,613 was for new construction work on 43 projects in 29 states, the District of Columbia and Alaska. Maintenance, operation and care were allotted $61,287,500; advance planning $500,000. The act specified that no planning could be undertaken or continued unless certified by the president or necessary to defense. No new construction could be initiated except the Dalles

OFFICIAL TESTING of a radar system for locating vessels, which was expected to end costly and dangerous fog jams in the New York harbour. A port official is shown being "talked" through harbour traffic, in May 1951, via two-way radio communication with a radar centre lock and dam, Oregon and Washington, and Old Hickory lock and dam, Tennessee, both multipurpose projects providing hydroelectric power. The important river and harbour projects allocated $1,500,000 or more for construction were: McNary lock and dam, Columbia river, Oregon and Washington, $42,900,000; Missouri river, Kansas City, Mo., to Sioux City, Ia., $4,000,000; Mississippi river, between Ohio and Missouri rivers, $5,000,000; Cheatham lock and dam, Tennessee, $3,000,000; Old Hickory lock and dam, Tennessee, $2,000,000; St. Anthony falls, Minnesota, $1,500,000; Gulf Intracoastal waterway, New Orleans district, $4,400,000; Demopolis lock and dam, Alabama, $4,000,000; Monongahela river, Pennsylvania, $4,000,000; Jim Woodruff dam, Florida, $6,300,000; Chief Joseph dam on the Columbia river, Washington, $16,892,000.

At the end of 1951 there were 686 authorized investigations in advanced stages of completion. The work involved in this survey program was approximately 60% complete. Included in the studies were the Trinity river, Texas; Galveston-Houston-Texas City channel, Texas; the coast of California, to determine the advisability of providing harbours of refuge for small craft; Hudson river improvement for deep-draft tankers; Duluth-Superior harbour, Minnesota; Illinois waterway duplicate locks; Delaware river, Philadelphia to Trenton; Atchafalaya river, Morgan City, La., to Mississippi river via Old River, La.; and a survey of the water resources of Alaska for navigation, power development, flood control and related purposes.

At the Bonneville dam and reservoir, Oregon and Washington, the ten electric-power generating units were operated at capacity throughout the year. At the Fort Peck dam, on the Missouri river in Montana, the reservoir was operated throughout the year for the maintenance of navigation on the Missouri river, and for the secondary purposes of flood control and hydroelectric production. Operation of the two completed generating units was continued during the major portion of the year, with the total power production during the first six months being approximately 145,481,000 kw.hr. Installation of a third generating unit of 35,000-kw. capacity was under construction. (G. Hb.)

Canada.—During 1951, about $1,400,000 was spent to widen ship channels in the Fraser river and add more dikes and dams to existing $11,000,000 Fraser valley dike water-control system. The Eastern Rockies Forest Conservation board announced plans to build dams to control and increase the flow of water from mountain ice fields to prairie rivers. The irrigation gates of the 2,530-ft. earth dam (largest in Canada) on the St. Mary river near Lethbridge, Alta., were opened in July, bringing river water to 500,000 ac. Stream flow throughout the year was heavy, and in October was 141% above normal. The federal government voted nearly $10,000,000 for the acquisition, construction and improvement of harbour and river works. After holding hearings at various Great Lakes centres, the international joint commission was authorized to adopt a $125,000,000 program to control and prevent pollution of boundary waters. (*See* also CANALS AND INLAND WATERWAYS.) (C. Cy.)

Roads and Highways.

World economic and political conditions prevented spectacular progress in the highway programs of most countries during 1951, but there were important extensions of highway systems and improvement of existing roads. In the world-wide search for additional supplies of certain minerals and other raw materials many development operations and plants were established in remote regions. In most instances highways had to be constructed to serve such activity.

United States.—Highway improvement in 1951 went forward at about the same rate as in the two preceding years when funds expended exceeded all previous levels. Increased costs, however, more than offset the gain in dollars expended. In 1950, expenditures for construction of all streets and highways amounted to $2,400,000,000 and maintenance of the great network of roads cost $1,400,000,000. The 1951 construction expenditure was estimated at $2,700,000,000, and it was certain that the maintenance expenditure would exceed that of 1950.

Large cities of the country, such as New York city, Chicago, Ill., Detroit, Mich., Atlanta, Ga., Denver, Colo., Los Angeles and San Francisco, Calif., made good progress in constructing expressways to solve urgent traffic problems. Many miles of main highways were rebuilt. A significant trend was wide acceptance of the idea that development along heavily travelled main highways and access to them must be regulated to preserve a free flow of traffic. A notable project of this character was the 28-mi. divided highway around Boston about 12 mi. from the centre of the city.

Progress in building roads, when measured by previous standards of performance, was excellent; but there was unsatisfactory progress toward correction of the many faults of the existing road system. The accumulated deficiency in rehabilitating worn and obsolete roads was 74,000 mi. in 1951 and was increasing at the rate of 5,000 mi. or more per year.

In the fiscal year ending June 30, 1951, the federal-state co-operative highway construction program was supported by a federal authorization of $450,000,000. All classes of federal-aid projects brought to completion during the fiscal year totalled 20,030 mi. The completed work included 4,850 mi. of highways and 849 bridges on the federal-aid system outside of cities; 554 mi. of streets and 294 bridges on urban portions of the federal-aid system; and 13,875 mi. of road and 1,556 bridges on the secondary or farm-to-market system. Work in national forests, national parks and miscellaneous construction totalled 752 mi.

Canada.—In eight of ten provinces work on the 5,000-mi., $300,000,000 Trans-Canada highway proceeded toward a scheduled completion date in 1956. In September contracts had been let totalling more than $50,000,000. Some delays were experienced from inability to obtain equipment and materials, but work was maintained in accordance with the previous schedule.

The Alaska highway was kept open throughout the year, and some improvements were accomplished in Canada through relocations to improve alignment and replacement of temporary bridges with permanent steel and concrete structures. Sections of the highway in Alaska were further improved with asphalt surfacing, all of the section within Alaska being scheduled for a surfacing of this type by 1953. Several truck and bus lines operated regular scheduled service over portions or all of the route between Dawson Creek, B.C., in Canada, and Fairbanks in Alaska. Canada built low standard roads extending from the Alaska highway at a point about 40 mi. S. of Whitehorse in the Yukon Territory to and somewhat beyond the village of Atlin and an access road to mining developments south and west of Watson lake. Another lateral feeder road was built northward from a connection about 30 mi. W. of Whitehorse.

Mexico.—The government devoted approximately one-sixth of its budget to development of internal transportation systems, which included a large-scale program of development of secondary or feeder roads to the main trunk arteries. With the completion of the major north and south routes leading to the United States border, Mexico initiated a large program of lateral road construction that brought better transport to large agricultural areas. A notable piece of highway work was the construction of a modern high-speed road across the Isthmus of Tehuantepec below Mexico City to connect ports on the Pacific ocean and the Gulf of Mexico.

Mexico also completed, without outside assistance, the last gap of the Inter-American highway within Mexico to connect with the Guatemalan frontier. An uncompleted and impassable 25-mi. gap on the Guatemalan side of the frontier alone prevented continuous all-weather travel from the United States to a point below Managua at the southern Nicaraguan frontier with Costa Rica. While the route immediately north and south of San José, Costa Rica, was open for all-weather travel there was still an impassable gap of 65 mi. in northern Costa Rica and 150 mi. in southern Costa Rica and northern Panamá. Work was resumed during 1951 on the Inter-American highway in El Salvador, northern Panamá and northern Costa Rica.

South America.—In Brazil and Argentina, road construction continued at a steady pace throughout 1951, including several large new projects of modern design adjacent to the larger cities.

Colombia obtained a loan of $16,500,000 from the International Bank for Reconstruction and Development to be used for construction of approximately 100 mi. of new highways and the rehabilitation of 2,000 mi. of existing trunk highways.

The most outstanding project in Venezuela was the complete relocation and construction of a modern high-speed four-lane divided highway, including several tunnels, on the approach to Caracas.

In Bolivia work continued on a section of new highway from Cochabamba to Santa Cruz with funds obtained by loan from the Export-Import Bank of Washington, D.C.

The Peruvian section of the Pan American highway was opened for all-weather traffic from Ecuador to Bolivia and Chile. The main route from La Tina to Concordia has a length of 1,632 mi., and the alternate routes to Aguas Verdes in the north and Desaguardero in the south add 489 mi., making a total of 2,121 mi. for the system. A new section of highway immediately south of Lima was opened to traffic in September. Work was begun on reconstruction of the Central highway penetrating the Andean range back of Lima toward the Cerro de Pasco mines.

The largest project under way in Ecuador during the year was the reconstruction of a section of highway from Manta to Quevedo financed by a loan from the Export-Import Bank of Washington, D.C.

Africa.—About 11 trans-African routes were classified and submitted for approval to the fourth Highways congress held in Johannesburg, U. of S.Af., in 1951. The Union of South Africa, having obtained a loan of $20,000,000 from the International Bank for Reconstruction and Development, embarked on a comprehensive program of highways to be completed in 1955. Priority was given to five roads to serve rich agricultural, dairy, livestock and ranching areas.

Ethiopia in 1951 established the Imperial Highway authority with responsibility for planning, repairing and maintaining the national road system to be developed under a loan of $5,000,000 from the International Bank for Reconstruction and Development.

Asia and Europe.—Road construction throughout the far east, except in the Philippines, progressed rather slowly during 1951 because of international tensions or internal disturbances.

In the Philippines, the large-scale road, street and bridge rehabilitation program begun in 1946 was drawing to a close. Only a few of the 490 bridges and more than 500 mi. of highway initiated under this program remained to be completed at the year's end.

In India and Pakistan, throughout the middle east and in Europe highway work continued in a rather normal manner, with demand for highways continuing to exceed the production of new highways and the extension of highway services. In Turkey, the large-scale highway development program initiated in 1947 continued apace. During 1951 the country began to reap the benefit of previous construction through drastically lowered hauling charges for produce and goods and in lowered passenger fares on intercity buses and trains. Roller Derby. The 15th year for this popular U.S. sport saw a continued growth in attendance. The third campaign of organized league competition reached a climax May 27–June 3, when more than 70,000 persons attended the round-robin series for the world's championship in New York city's Madison Square garden.

Five of the nation's top teams, the New York Chiefs, New Jersey Jolters, Washington Jets, Chicago Westerners and Brooklyn Red Devils were chosen to compete in the title playoffs, and the honours went to the Chiefs for the second season in a row when the New Yorkers defeated Chicago, 26–25, in the last round.

A record roller derby gathering of 18,861 saw the Chiefs and the Westerners wage the top battle of the year, with New York winning in the last minute on a point by Billy Bogash after trailing, 14–12, at the intermission. Fred Noa's five-point grand slam had given the winners a 19–16 edge but the rivals skated along to a 25–25 deadlock in the closing three minutes and set the stage for the deciding point.

Captains Sam Skobel and Midge (Toughie) Brasuhn of Brooklyn and player-coach Russ Massro of Chicago were selected as the most valuable players in the tourney. The Chicago Westerners won the National Roller league championship in the regular 1950–51 campaign with 102 triumphs and 82 losses. Chicago's Bert Wall, with 643 points, captured individual scoring honours. Gerry Murray of the New York Chiefs, who had taken the award in the previous season, again led the women with 614 tallies. (T. V. H.)

Roman Catholic Church. In 1951 the College of Cardinals was reduced to 49 members by the deaths of Francesco Cardinal Marchetti-Selvaggiani, vicar of Rome, secretary of the Holy Office, Dennis Cardinal Dougherty, archbishop of Philadelphia, Pa. and dean of the Roman Catholic hierarchy in the United States, and Adam Stefan Cardinal Sapieha of Cracow, Poland.

Five saints were canonized during the year: St. Maria Domenica Mazzarello, founder of the Daughters of Mary Help of Christians, St. Emilia de Vialar, founder of the Institute of the Sisters of St. Joseph of the Apparition, St. Antonio Maria Gianelli, Bishop of Bobbio, St. Francesco Saverio Maria Bianchi of the Barnabites, St. Ignatius Laconi of the Minor Capuchins. In June Pope Pius X was beatified, the eighth pontiff in the history of the Catholic Church to be so honoured.

An encyclical, *Ingruentium Malorum,* appealed to Catholics to recite the rosary for peace. The 15th centenary of the Ecumenical Council of Chalcedon was commemorated in an encyclical letter, *Sempiternus Rex,* which expressed a hope for the return of those separated from the apostolic see and declared again the doctrine of the two natures in Christ. Missionary progress during the prior 25 years was praised by Pope Pius XII in the encyclical, *Evangelii Praecones*. The number of missions was increased from 400 to 600 and the number of native and foreign priests from 14,800 to 26,800.

Addressing the fourth annual congress of the World Movement for Federal Government, his holiness told members that their aims to bring about an effective political organization of the world were in "conformity with the traditional doctrine of the Church." He warned, however, that it must not become a mere superficial and mechanical arrangement based on what the pope terms a "mechanical unitarianism." He stressed the need of harmonizing the political organization of the world with "the whole of the natural relations and with the normal and organic order that rule the particular relations between men and between different nations."

In March the Sacred Consistorial Congregation declared excommunicated all persons in Czechoslovakia who were in any way connected with the banishment of Archbishop Josef Beran of Prague. In June Vatican sources reported Archbishop Josef Matocha of Olomouc, Moravia, was a prisoner in his residence. The archbishop was highest ranking member of the hierarchy after Archbishop Beran.

Hungary sentenced Archbishop Josef Groesz of Kalocsa to 15 years in prison after a trial similar to that of Joseph Cardinal Mindszenty. A State Office of Church Affairs was set up under Istvan Kossa, Politburo member, and all parish church lands were ordered turned over to the Communist state.

In China 1,240 foreign-born missionaries were expelled and at least 300 foreign-born and native bishops, priests, brothers and sisters were imprisoned. Of those expelled 18 were bishops, 530 priests, 40 brothers and 650 sisters. Of 216 Catholic hospitals, only 12 were still functioning. Most of the 800 dispensaries no longer existed. Practically all Catholic educational institutions had closed or disappeared completely.

War Relief Services of the National Catholic Welfare conference assisted directly in the immigration of 30,202 persons to the United States during the year. Food, clothing and medicines weighing 76,757,786 lb. and valued at $21,892,800.68 were sent for distribution in the areas of greatest need throughout the world; 3,811,407 lb. of relief material valued at almost $5,000,000 was sent to Korea.

In 1951 the Roman Catholic population for the United States, Alaska and the Hawaiian Islands was 28,634,878. There were 23 archdioceses, 102 dioceses and 1 vicariate apostolic, Alaska. There were 4 cardinals, 24 archbishops, 156 bishops, 40 abbots, 43,899 priests, 7,620 brothers and 152,178 sisters.

The 48th annual convention of the National Catholic Educational association was held in Cleveland, O. and the National Catholic Conference on Family Life met for its 19th convention in St. Louis, Mo., in March. The 37th annual convention of the National Conference of Catholic Charities was held in Detroit, Mich.; the 29th convention of the National Catholic Rural Life conference in Boston, Mass., and the 69th annual meeting of the Knights of Columbus in Pittsburgh, Pa.

Among the awards given during the year were the Magnificat medal, honouring an outstanding Catholic college alumnus, awarded to John H. Daly of Washington, D.C.; the Laetare medal, presented by Notre Dame university, Notre Dame, Ind., to a distinguished Catholic layman, was received by John Henry Phelan, Beaumont, Tex., businessman and philanthropist; the Rerum Novarum award of St. Peter's college, Jersey City, N.J., given annually to a layman furthering labour-management relations based on papal teaching, was received by Frederick W. Mansfield, attorney and former mayor of Boston; the James J. Hoey awards for interracial justice were given to Mrs. Roger L. Putnam, of Springfield, Mass. and Francis M. Hammond, of Seton Hall college, South Orange, N.J.

Bishop John F. O'Hara of Buffalo, N.Y., was made archbishop of Philadelphia, Pa., and Msgr. John L. Paschang of Omaha, Neb., was named bishop of Grand Island. Msgr. Joseph P. Dougherty of Seattle, Wash., was made the first bishop of the new diocese of Yakima, Wash.; Rev. Robert Dermot O'Flanagan of Anchorage, Alsk., was made first bishop of the new diocese of Juneau, Alsk.; Bishop Hugh L. Lamb was made first head of the new Greensburg, Pa., diocese; Msgr. John B. Franz of Springfield, Ill., became first bishop of the new Dodge City, Kan., diocese.

The bishops of the United States, in a statement on Nov. 17, declared that men in public life were bound by the same laws of justice and charity as those which bind individuals; and that dishonesty, slander, detraction and defamation of character are as truly transgressions of God's commandments when resorted to by men in political life as they are for all other men.

The Holy Year, which had been extended through 1951, was formally closed at the shrine of Our Lady of Fatima near Lisbon, Port. (*See* also CHURCH MEMBERSHIP; RELIGIOUS EDUCATION; PIUS XII; POLAND; SOCIETIES AND ASSOCIATIONS, U.S.; VATICAN CITY STATE.) (J. LaF.)

Rosenberg, Anna M.

(1902–), U.S. assistant secretary of defense, was born on June 19 in Budapest, Hung., the daughter of Mr. and Mrs. Albert Lederer. She was taken to the U.S. in 1912 and naturalized in 1919. She was married to Julius Rosenberg, New York businessman, in 1919.

Mrs. Rosenberg became a public relations consultant and after 1935 served in a succession of important government positions, including: regional director of the National Recovery administration; regional director of the Social Security administration; regional director of the Office of Defense, Health and Welfare Services; regional director of the War Manpower commission, and a member of the Advisory Committee on Policy of the Office of the Co-ordinator of Inter-American Affairs.

As personal representative of Pres. Franklin D. Roosevelt in 1944, and of Pres. Harry S. Truman in 1945, Mrs. Rosenberg visited the European theatre of war during World War II. From 1942 to 1945 she served as secretary of President Roosevelt's Labor Victory board. From 1944 to 1947 she served as a member of the Advisory board of the Office of War Mobilization and Reconversion.

She was appointed assistant secretary of defense by President Truman, at the request of the secretary of defense, Gen. George C. Marshall, in Nov. 1950.

One of her tasks during 1951 was the preparation of the draft of a measure known as the Universal Military Service and Training bill, which she helped present before congress as being a means of providing equitable distribution of manpower among the armed forces, agriculture and industry. Its chief provision called for the training of 18-year-olds. In August she made a two-week tour of U.S. bases in Europe and North Africa, and in October visited U.S. forces in Korea.

Rotary International: *see* SOCIETIES AND ASSOCIATIONS, U.S.

Rowing.

Cambridge university of England went to the U.S. for the first time for an invitation regatta in April 1951 and defeated Yale on the Housatonic river, Darby, Conn., at $1\frac{3}{4}$ mi. by 4 lengths on smooth water with a following wind. The times were Cambridge 8 min. 22.4 sec., Yale 8 min. 36 sec. Five days later, the Cantabs beat Harvard, Boston university and the Massachusetts Institute of Technology at the same distance with head winds and rough water. The times were Cambridge 9 min. 38 sec.; Harvard 9 min. 43.5 sec.; Boston university 10 min. 1 sec.; M.I.T. 10 min. 4 sec.

In other important college races of the year, Rutgers beat La Salle college of Philadelphia, Pa.; Princeton defeated Navy; Penn won from Rutgers and a week later won the Childs cup

HARVARD UNIVERSITY CREW (left) finishing first in the eight-oared scull event at the Schuylkill river skimmer races in Philadelphia, Pa., May 12, 1951, and winning the Adams cup for the tenth consecutive time

from Princeton, Columbia and Rutgers; Columbia beat Brown; Yale won from Penn by 4 ft. and Syracuse upset Cornell; M.I.T. defeated Rutgers.

Yale won the Blackwell cup from Penn and Columbia and also won the Carnegie cup from Princeton, Cornell and Syracuse. Princeton regained the Compton cup from Harvard after 15 years. Navy retained the Stevenson cup from Cornell and Columbia. Yale beat Wisconsin at Madison, Wis., and Rutgers outrowed Brown by 4 lengths. Wisconsin beat Columbia and Rutgers. Harvard kept the Adams cup over Navy and Penn on the Schuylkill river, Philadelphia.

In the lightweight division, Penn won the Hammond trophy. Yale retained the Goldthwait cup over Harvard and Princeton. Pennsylvania won the lightweight sprint championships and the Wright cup in 6 min. 43 sec. Yale was second at 6 min. 45.3 sec., followed by M.I.T., Columbia, Princeton and Cornell.

At Seattle, Wash., the Washington Huskies swept a regatta from California and Stanford at $2\frac{3}{4}$ mi. on Lake Washington in 15 min. 38.4 sec. to 15 min. 47 sec.

California beat Wisconsin at Oakland, Calif., at 3 mi. in 14 min. 26 sec. to 15 min. 3.2 sec. and Harvard beat Cornell.

Yale under Coach Jim Rathschmidt defeated Harvard and nine other college crews in the Eastern sprints by $\frac{2}{3}$ length at 2,000 m.: Yale 6 min. 18.4 sec.; Harvard 6 min. 20.6 sec.; Princeton 6 min. 28.4 sec. Following the leaders were Penn, Syracuse, Cornell, Navy, Columbia, Rutgers, M.I.T. and Boston University. In this same regatta Harvard retained the Rowe cup, scoring 14 points to Yale's 10.

In the ninth Dad Vail Rowing association regatta at Boston, Mass., La Salle college of Philadelphia won the varsity race in 6 min. 49 sec. Washington and Lee was second, 6 min. 50.8 sec., followed by Florida Southern college, Dartmouth, American International, Rollins, Tampa university and Amherst. Dartmouth won the junior varsity in 6 min. 52 sec. with La Salle second; and American International won the Brett bowl for freshmen in 7 min. 15 sec. with Dartmouth second.

In the 17th annual Schoolboy championships at Philadelphia, La Salle High School of Philadelphia won the eight-oared championship by $\frac{1}{2}$ length from Ecorse High School of Michigan. Walter M. Hoover, Jr., won the championship senior singles for Grosse Point High School of Michigan.

The 49th Intercollegiate Rowing Association regatta was held for the second successive time at Marietta, O., and again flood conditions marred the program. Distances were cut from 3 to 2 mi. and the order of events was changed because of the swift current. In the varsity race the Wisconsin Badgers, coached by Norman Sonju, covered the abbreviated course in 7 min. 50.5 sec. followed by Washington, Princeton, California, Penn, M.I.T., Stanford, Cornell, Syracuse, Boston University, Columbia and Navy. California won the junior varsity race, and Washington took the freshman event.

The 1952 regatta was to be held on Lake Onondaga at Syracuse, N.Y.

In the 86th Harvard-Yale classic at 4 mi. Harvard overwhelmed Yale's sprint champion crew. Yale led to the halfway mark when one of the crew was taken ill. Thereafter Harvard won going away. Harvard also won both the junior varsity and the freshman events.

The 77th championships of the National Association of Amateur Oarsmen were held on Lake Quinsigamond, Worcester, Mass. The Detroit Boat club won the Julius H. Barnes point trophy followed by Vesper Boat club of Philadelphia and the West Side Rowing club of Buffalo, N.Y. The West Sides won the eights with Detroit second and Vesper third. Robert Williams of Hamilton, Ont., won the singles sculling event; Harold Finigan of the Malta Boat Club, Philadelphia, won the heavy dash; and James Barker of the Undine Barge Club, Philadelphia, the light dash. The New York Athletic club took the pairs with coxswain and the Fairmounts of Philadelphia the pairs without coxswain.

In England, Cambridge university defeated Oxford in its 97th race on the rough, rain-swept Thames $4\frac{1}{4}$ mi. course. The times were Cambridge 20 min. 50 sec., Oxford 21 min. 28 sec.

Thirteen countries were represented at the Henley Royal regatta. British crews won all the events except the Thames Challenge cup, which went to Pennsylvania's 150-lb. championship crew. Penn defeated Florsheim-Russelsheim, a German heavyweight crew, by one length. Lady Margaret Boat club won the Grand Challenge cup. J. G. P. Crowden and C. B. M. Lloyd, Cambridge, won the silver goblets for pairs from Belgium. P. Bradley and R. D. Burnell, Leander, won the double sculls, and T. A. Fox, Pembroke college, Cambridge, beat Erik Larsen of Denmark for the diamond sculls.

The Maple Leaf trophy for points in the Royal Canadian Henley regatta at Port Dalhousie, Ont., and the Ned Hanlan cup for eights went to the West Side Rowing club of Buffalo, N.Y. Jack Guest, Jr., of the Don Rowing Club, Toronto, Ont., won the championship of Canada for single sculls. Ten of the championship events went to U.S. crews.

The European championships were held at Macon, Fr. The eights were won by England with the famous Cambridge crew, which nosed out Denmark by 20 in. Italy took the fours and the pairs with coxswain. Switzerland won the doubles and Erik Larsen won the singles. (C. L. Bt.)

Rubber. The unsettled conditions in the world's principal natural rubber producing areas continued throughout 1951. In Malaya, guerrilla warfare and terrorist activities were unabated and much the same could be said for Indonesia excepting the east coast Sumatra district where definite improvement was reported. Despite these unfavourable conditions, Malayan production at the end of August was 409,573 long tons, compared with 445,539 long tons for the same period of 1950; that for Indonesia at the end of July, 498,735 long tons (357,408 long tons at end of July 1950); and that for French Indochina at the end of July, 23,862 long tons (22,275 long tons for same 1950 period). The sharp rise in Indonesian production over 1950 figures was the result of native output, derived in part from illicit tapping of trees on European estates and in part from the activities of small holders whose great potential producing capacity is revealed only when rubber prices are high. The price of natural rubber declined from a high of about 81 cents (U.S.) in February to 48 cents per pound at mid-December. The sharpest drop was registered in the April to June period. Several factors contributed to this change: (1) the U.S. government became the sole purchaser of rubber in that country by an order terminating on March 31 all rubber activities on the New York commodities exchange except for liquidation of contracts; (2) General Services administration announced that the U.S. stock pile goal had nearly been reached; (3) the Malayan government on April 9 set up a licensing system over rubber exports and in May banned further rubber shipments to Communist China; (4) production of U.S.-made rubber rose sharply. World production of natural rubber through August was 1,267,500 long tons (1,167,500 long tons through Aug. 1950) and world consumption for the same period was 1,017,500 long tons (1,077,500 long tons for same 1950 period).

Natural Rubber.—World production of natural rubber in 1950 was 1,850,000 long tons, exceeding world consumption of 1,705,000 long tons by 145,000 long tons. Consumption of natural rubber in the U.S. through October, reduced as compared with 1950 figures by government allocation, was 385,793 long tons and of synthetic for the same period 634,561 long tons. Consumption of natural rubber over the same period in 1950 was 624,197 long tons, of synthetic 436,536 long tons. Imports of natural rubber latex into the U.S. through October were 50,353 long tons dry rubber content, and into the United Kingdom through August 14,354 long tons dry rubber content. In the U.S. about half of this tonnage went into foamed latex products such as mattresses and chair cushions. In the field of technology, additional experimental sections of asphalt roads were laid in the U.S. incorporating a percentage of natural and synthetic rubber powders in the surface coating. Evidence that rubber growers were aware of the need for greater uniformity of product appeared in small-scale production, primarily for test purposes, of specification rubbers technically classified (T.C. rubbers) at the plantation and so marked on the containers as to Mooney viscosity and rate of vulcanization. Laboratories in consuming countries were co-operating in these tests.

Synthetic Rubber.—The U.S. government-owned general-purpose synthetic rubber (GR-S) plants, reopened in Sept. 1950, showed a steadily rising production throughout 1951 (November and December production estimated) for a total output through December of 698,527 long tons. Of this amount about 300,000 long tons were cold rubber (polymerized at 41° F. instead of 122° F. used for ordinary GR-S). Production of other synthetic rubbers in the U.S. through December was: Butyl rubber 73,105 long tons; N-type rubbers 15,879 long tons; Neoprene 59,500 long tons; for a grand total of 847,011 long tons (November and December production estimated). Plans were made for minor modification of existing equipment to raise the total annual capacity of these plants to 860,000 long tons of which 640,000 long tons would be available for cold-rubber production.

The relatively new synthetic, silicone rubber, appeared in increasing quantities, production for the year being about 2,000,000 lb. Made by hydrolysis of dimethyl dichloro silane followed by elimination of water by condensation to build up the molecular weight sufficiently, it is vulcanized by heating with organic peroxides. The vulcanized material has unusually low compression set rather than high tensile. Its resistance to change over wide temperature ranges is equalled by no other known rubber. Stocks can be prepared which will withstand continuous service at 400° to 500° F. and will remain flexible at −120° F. The selling price of this rubber was about $5 per pound.

Oil-extended synthetic rubber, while not new in principle, received extensive attention. This type of rubber is prepared by adding specially selected petroleum oil, as an aqueous emulsion, to the latex of high viscosity cold rubber or other especially tough rubbers and jointly coagulating the mixture. The industry refers to this as cocoagulation. Production of oil-extended synthetic rubber through September amounted to 15,146 long tons. The oil-enriched rubber is used as though it were all-rubber hydrocarbon and tires made exclusively with this rubber showed excellent performance. This process in effect increases synthetic rubber plant capacity and reduces production cost per pound.

Reclaimed Rubber.—World production of reclaimed rubber in 1950 was 380,293 long tons. In the U.S., consumption of reclaimed rubber through Oct. 1951 was 299,897 long tons as compared with 1950 figures for the same period of 243,290 long tons. More than half of this increased consumption of 56,600 long tons was primarily caused by the shortage of natural rubber

resulting from government allocations.

Tires and Tubes.—Total U.S. shipments of pneumatic tire casings for the year ending July 31, 1951, were 96,477,630 (73,444,561 passenger car, 16,320,699 truck and bus; and 6,712,370 farm, industrial and aeroplane). Total U.S. shipments for the first nine months of 1951 were 66,161,226 (80,923,707 for same 1950 period) distributed as follows: passenger car 48,418,791 (64,815,922 for same 1950 period); truck and bus 12,543,729 (11,232,230 for same 1950 period); farm, industrial and aeroplane 5,198,706 (4,875,555 for same 1950 period). Rumania. A people's republic of southeastern Europe, Rumania is bounded north and northeast by the U.S.S.R., east by the Black sea, south by Bulgaria and west by Yugoslavia and Hungary. Area: (1939) 113,889 sq.mi.; (1947, without Bessarabia, northern Bukovina and southern Dobruja) 91,671 sq.mi. Pop.: (1939 est.) 19,933,800; (1950 est.) 16,094,000. Language (1948 census): Rumanian 85.7%; Hungarian 9.4%; German 2.2%; Yiddish 0.9%; other 1.8%. Religion (1947 est.): Greek Orthodox 81%; Greek Catholic 9%; Roman Catholic 7%; other 3%. Chief towns (pop., 1945 est.): Bucharest or Bucureşti (cap., 1948 census, 1,401,807); Cluj (110,956); Jassy or Iași (108,987); Timișoara (108,296); Ploești (105,114); Brăila (97,292); Galați (93,229). Chairman of the presidium of the grand national assembly in 1951, Constantin Parhon; prime minister, Petru Groza.

History.—Rumania was the last of the people's democracies to introduce the soviet type of national plan. In 1949 and 1950 one-year plans were published, and in due course it was declared that they had been fulfilled by an appropriate percentage. In 1951, however, a five-year plan came into force. This plan was on the scale of the "revised" plan of Rumania's northern and western people's democratic neighbours rather than on that of their original plans. Considering that Rumania had always been economically more backward than Hungary, let alone Czechoslovakia or Poland, it might be argued that its new plan was the most ambitious of all the satellite states. Total investment in the five-year period was to be 1,330,000,000,000 lei. Of this sum 51% was to go to industry, 16% to communications, 10% to agriculture and 13% to miscellaneous building and social service purposes. The last category, as in the other people's democracies, would of course include construction of government and Communist party premises and the cost of propaganda and political agitation. Among specific figures given for output in the last year of the plan period were 8,500,000 tons of coal (including lignite); 1,250,000 tons of steel; 4,700,000,000 kw.hr. of electric power; 10,000,000 tons of crude oil and 5,000 tractors. The coal target was nearly two and a half times the output of 1950. Tractors had not hitherto been produced in Rumania. The oil target was extremely high. Even if, as might be expected, the most rapacious methods were used to extract for the soviet masters of Rumania the maximum amount to the irreparable detriment of the industry in the future, it was doubtful whether this figure could be achieved. Under the plan the industrial labour force was to increase by 38%. The planners also maintained that the productivity of labour would be increased by 75% and the standard of living by 80%. The plan laid stress on the creation of new industries in regions that had hitherto been almost exclusively agricultural —Moldavia, Dobruja, Oltenia and the northern part of Transylvania.

In collectivization of agriculture Rumania was still far behind the other people's democracies, including even Poland. In September there were 1,083 collective farms in the country, with 73,000 member families, only a small increase over 1950. In September the Workers' (Communist) party published a statement on the situation. It claimed that collective farms were achieving yields on the average of 25% higher than those of individual peasant holdings, but admitted that they were not always faithfully executing official instructions on organization. The party urged further efforts by its members to convince and persuade peasants to join collectives. It announced the creation of a new type of organization, the agricultural association, which it described as a lower form of co-operative farm. The experience of the Soviet Union and the other people's democracies suggested that this was a bait to induce peasants to join by making far-reaching concessions in theory to the principle of private property, concessions which could later be abolished at the convenience of the authorities. It was not a defeat of government policy by Rumanian peasant resistance. Rather it was a small tactical retreat which would make possible a much larger advance. Information on subsequent developments was not available. A statement in the Workers' party daily paper *Scânteia* of Oct. 10 that there were 4,000 associations, with 354,000 peasant members and controlling 428,000 ha. suggested, however, that "conviction and persuasion" were used to good effect.

Polemics against Yugoslavia continued throughout the year. They reached a climax at the time of the Aug. 23 anniversary celebrations in Bucharest, when soviet Marshal Klimenty Voroshilov made a menacing speech. From Aug. 9 to Aug. 13 a trial was held of persons alleged to have spied on behalf of Great Britain. There were four death sentences. On Sept. 10 another spy trial ended, the accused in this case being allegedly instructed by the Vatican. Four persons were condemned to life imprisonment.

Rumanian official figures claimed that of 1,800,000 children at elementary schools, 61% were of working-class or peasant origin. The number of secondary school pupils was 3.8 times larger than in 1938–39. Teaching in languages other than Rumanian was given in 3,339 schools and 17 faculties. The quality of the teaching might be indicated by a report from the Rumanian official news agency of July 5 of a session of the literature and art section of the Rumanian academy when a paper was read on the "Importance of the Works of Stalin in the Development of Literature in Rumania." The minister of education, Nicolae Popescu-Doreanu, then declared: "No other conception may be taught in all elementary, junior and senior high schools than the Marxist-Leninist one, based on Generalissimo Stalin's teachings. Only thus shall we be able to give value to our national language, created by the people." (H. S-W.)

Education.—Schools (1950): primary 14,000, pupils 2,079,357; secondary, pupils 365,310; institutions for higher education 7, universities 4. Illiteracy (1948): 23.1%.

Finance and Banking.—Budget: (1951 est.) revenue 433,900,000,000 lei, expenditure 429,900,000,000 lei. Currency circulation (July 1948): 32,000,000,000 lei. Monetary unit: leu (pl. lei) with an official exchange rate of 153 lei to the U.S. dollar.

Foreign Trade.—(1948): Imports U.S. $96,000,000; exports U.S. $116,000,000. Main sources of imports (1947): U.S.S.R., U.S., Czechoslovakia and Hungary. Main destinations of exports (1947): U.S.S.R., Czechoslovakia, Bulgaria and Hungary.

Transport and Communications.—Roads (1945): 43,163 mi. (modernized roads, 1947, 1,150 mi.). Licensed motor vehicles (Dec. 1950): cars 14,000, commercial 12,000. Railways (1949): 7,363 mi. Shipping (1948): merchant vessels 15, total tonnage 32,962. Telephones (1949): 135,000. Radio receiving sets (1949): 226,000.

Agriculture.—Main crops (metric tons, 1947): wheat (1948) 2,600,000; maize 5,279,000; barley 360,000; oats (1946) 280,000; rye 66,000; millet (1948) 18,000; potatoes (1949) 1,090,000; sugar, raw value (1950–51 est.) 110,000; hemp fibre (1948) 27,000; cotton seed (1948) 6,000; tobacco (1948) 16,800. Livestock: sheep (Dec. 1948) 7,300,000; pigs (1950 est.) 2,300,000; cattle (1950 est.) 4,950,000; horses (Dec. 1948) 939,000.

Industry.—Industrial establishments (Oct. 1947): 28,295; persons employed 462,305. Fuel and power (1947): coal 162,000 metric tons; lignite and brown coal 2,108,000 metric tons; natural gas 2,106,000,000 cu.m.; electricity 712,000,000 kw.hr.; crude oil (1950) 4,300,000 metric tons. Raw materials (metric tons, 1947): pig iron 91,000; steel 183,000; lead 3,000; zinc 2,000; iron ore 115,000; gold (kg.) 2,231; silver 481 fine troy oz. Manufactured goods (metric tons, 1947 est.): refined petroleum products 3,450,000; cotton yarn 11,300; cotton fabrics 3,200; cement 418,000; sulphuric acid (1946) 24,700; sawed timber 1,359,000 cu.m.; paper 47,500.

Rural Electrification.

The Rural Electrification administration estimated that 4,522,637 U.S. farms, or 84% of all those in the U.S., had central station electric service as of June 30, 1951. This estimate was based on preliminary 1950 census reports.

At the start of the federal rural electrification program in 1935, the percentage was 10.9; on April 1, 1940, 30.4.

The cumulative total of REA loans passed the $2,450,000,000 mark in 1951, and REA-financed lines in operation reached 1,150,000 mi. The borrowers had added about 68,000 mi. of line and 208,000 consumers to their systems in the first three quarters of 1951. At that time the borrowers were serving a total of 3,611,791 consumers.

REA's rural telephone lending program was two years old on Oct. 28, 1951, with assurance to 175,000 farms and other rural establishments of new or improved telephone service. Under an amendment to the basic REA legislation, congress authorized REA to undertake a rural telephone loan program to provide for the expansion and improvement of telephone service. As in the electrification program, the loans were to bear 2% interest and be amortized over a period of 35 years.

At the close of the second year of this program, REA had approved nearly $49,000,000 in loan allocations to 83 commercial companies and 50 co-operatives for area coverage telephone service in rural areas of 35 states.

Under the electrification program, REA borrowers in 1951 included 986 rural electric co-operatives, 41 public power districts, 24 other public bodies and 25 commercial power companies. They had 1,010 rural power systems in operation, 3 more than in 1950. During the first nine months of the year, REA had approved $143,563,710 in electrification loans to its borrowers, increasing the cumulative total to $2,455,199,314. Loan funds advanced to borrowers from Jan. 1 to Sept. 30, 1951, to pay for completed construction, totalled $179,026,808. This brought loan funds advanced to a cumulative total of $1,885,434,084.

REA borrowers increased their financial stability during 1951 by increasing their advance repayments of REA loans to $36,650,000. Their debt-service payments of principal and interest cumulatively totalled $309,879,582, which was nearly $15,000,000 more than the total amount advanced by REA during its first six years of existence.

REA borrowers distributed about 25% more power in 1951 than in 1950. They sold almost 8,750,000,000 kw.hr. of electric energy, exceeding sales of fiscal 1950 by 1,750,000,000 kw.hr. The average annual consumption of electricity per consumer on REA-financed lines increased 222 kw.hr. from 1,988 kw.hr. to 2,210; for 1950 the increase was 141 kw.hr.

As the year ended, the contribution of rural power lines to the nation's mobilization effort grew more important daily. Farmers beset with the problem of dwindling manpower were depending more and more on electricity for their defense work of providing vitally needed food and fibre. (R. SD.)

Canada.—At the end of World War II there were 21,569 mi. of rural lines bringing electricity to farms of Ontario; by Sept. 1951 the mileage had increased to 37,239. During the period the horsepower demand went from 132,551 to 314,681. That expansion of demand indicated not only more buoyant Ontario farm revenues during the postwar years but also a more active acceptance of electrical conveniences on the part of the 313,285 farmers buying power (157,285 in 1945).

The autumn session of the Quebec legislature placed an additional $5,000,000 at the disposal of the Rural Electrification bureau (which in the 1945–51 period spent $15,000,000 building 13,287 new rural lines to serve about 100,000 new customers) to be used to help put up transmission lines through electricity co-operatives. In 1945 20% of Quebec's farms were electrified; in 1951, 52%.

In Saskatchewan, amendments to the Rural Electrification act permitted the crown-owned Saskatchewan Power corporation to make three-year loans to farmers unable to pay for construction costs. (C. CY.)

Rural Rehabilitation Loans: *see* FARMERS HOME ADMINISTRATION.

Russell, Richard Brevard

(1897–), U.S. senator from Georgia, was born on Nov. 2 in Winder, Ga. He studied at the Agricultural and Mechanical school at Powder Springs, at Gordon institute in Barnesville, and at the University of Georgia, where he took his law degree in 1918. After serving in the U.S. naval reserve in World War I, he began practising law in Winder, was elected county attorney and in 1921 was elected to the Georgia assembly. He remained there for 10 years, serving as speaker from 1927 until his inauguration as governor for the 1931–33 term. In 1932 he was elected to fill the unexpired term of U.S. Sen. William J. Harris, and he was re-elected in 1936, 1942 and 1948. He was a leader of the senate States' Rights group, chiefly southerners, and opposed such measures as the Fair Employment Practices bill, the anti-lynching bill, and the anti-poll tax bill. He was well-known as a proponent of economy in government, and as early as 1943 he was on record as saying that the U.S. post-World War II policy was ill-defined, and that a closer check should be kept on materials going to the Allies. At the 43rd annual governors' conference held in Gatlinburg, Tenn., in September and October 1951, Gov. James F. Byrnes of South Carolina named Senator Russell as his choice for the presidential nomination, as an alternative to Sen. Harry F. Byrd (Va.). The intimation was that Russell would be the southern bloc's choice against the renomination of Pres. Harry S. Truman in the 1952 election race.

Russell Sage Foundation: *see* SOCIETIES AND ASSOCIATIONS, U.S.

Russia: *see* UNION OF SOVIET SOCIALIST REPUBLICS.

Russian Literature. The writers of the Soviet Union drew their inspiration in 1951 from the same sources as in the years before: the struggle of the "innovators" against routine in industry and agriculture; the transformation of nature by great enterprises; the "great patriotic war"; the history of Russia; the peace movement. The best-known members of the Union of Writers in fact published nothing of importance, and there was no masterpiece to hail.

The poets Evgheny Dolmatovsky, Margarita Aligher, Nikolay Gribachev and Mikhail Isakovsky, *inter alios,* had new poems in the leading periodicals (*Znamia, Novy Mir, Zvezda Oktiabr*). Serghey Mikhalkov made a volume of his collected *Fables.* Novels included *On the Way,* by Hans Leberecht, about the progress of agricultural collectivization in Estonia; *The Height,* by Evgheny Vorobiev, on the builders of a giant metallurgical plant; *The Conquerors,* by Sharaf Rashidov, on the irrigation of desert areas in Uzbekistan; *The Red Flag,* by A. Kalinin, on patriotic resistance in the Don and Volga regions, 1942–43; *Peaceful Town,* by G. Berezko, on the struggle of the Tula patriots against the invader at the end of Oct. 1941; *In a Distant Harbour,* by L. Zaitsev and G. Skulsky, on the naval forces in a Pacific port after World War II; *On the Volcanoes of Manchuria,* by P. Daletsky, exalting the heroism of the Russian people during the Russo-Japanese War of 1904–05 and laying the blame for defeat on the tsarist regime; *The Heart,* by the Ukrainian writer V. Sobko, on the creation of a democratic Germany after the soviet victory over Hitlerism; and *Stenka Razin,* by S. Zlobin, a long historical novel about the 17th-century peasant revolts on the Don and the Volga.

In the sphere of literary criticism new books were: *Nikolay Novikov and Russian Culture in the 18th Century,* by G. Makogonenko; *Lermontov* (2nd ed., enlarged), by I. Andronikov; *A. N. Tolstoy,* by Mme. V. Shcherbina, on the 40-year literary activity of the novelist Alexey Tolstoy, author of *Peter the Great.*

The phenomenon most typical of soviet literary life in 1951 was the new edition, in a very much altered form, of *The Young Guard,* a celebrated novel on the exploits of young Communists in the Ukraine during the German occupation, by Aleksandr Fadeyev, president of the Union of Writers. The author had entirely rewritten his book in the light of the criticism of it by the Communist party and by *Pravda,* so as to bring into prominence the party's directing role in the clandestine operations of the heroes of Krasnodon.

Rewriting was the fashion, and the novelist V. Katayev imitated Fadeyev in revising his *For the Power of the Soviets,* in which the scene is set in wartime Odessa. Katayev recast the whole book and demonstrated in the new version that all the credit for the people's resistance to the German invaders was due to the Communist party.

The year 1951 was also remarkable for two literary occasions: ten-day congresses were held for writers and artists of the Ukraine (June 15–25) and of Uzbekistan (Nov. 17–27). At the Ukrainian congress in particular several novelists and poets (Vladimir Sosyura, Aleksandr Korneychuk, Wanda Wasilewska) were gravely reproached for "nationalist deviations."

The press devoted much space to articles on the second Congress of Young Writers, held in Moscow from March 15 to 20, 1951 (the first had been in 1948). About 300 novices were assembled in the capital and introduced to their seniors. (A. Pr.)

Rye. The 1951 U.S. harvested rye crop of 21,395,000 bu. approximated the 21,264,000 bu. of 1950, but was significantly smaller than the 30,173,000-bu. average for the decade of 1940–49. Of 3,558,000 ac. planted for all purposes in the autumn of 1950, 1,718,000 ac. were harvested, about the same as in 1950 but far below the 2,448,000 ac. average for 1940–49. The yield was 12.5 bu. per acre—slightly above average for the decade. As usual, three-fifths of the harvested grain was in South Dakota (6,656,000 bu.), Minnesota (2,850,000 bu.), North Dakota and Nebraska. The price to farmers, which stood at a low of $1.48 per bushel in January, late in the year reached the highest levels since 1948 as the fear of heavy Canadian imports diminished. The rye production goal for harvest in 1952 was officially announced as 1,828,000 ac. and 22,000,000 bu. The December report indicated a decline of about 30% in the acreage planted for all purposes, including harvest in 1952, in the most important rye-grain producing states.

Rye Production of the Principal Producing Countries

(In thousands of bushels)

Country	1951	1950	Average, 1935–39
U.S.S.R.	...	910,000	885,000
Western Germany	119,500	119,000	119,000
Czechoslovakia	...	...	62,078
Turkey	25,780	20,830	14,301
Spain	22,500	20,000	19,205
United States	21,395	21,264	44,917
France	20,500	24,000	29,993
Austria	19,000	16,500	20,611
Canada	18,014	13,333	9,191

World rye production in 1951 was estimated at 1,680,000,000 bu., about the same as in 1950 but slightly below the prewar average. Argentina raised the price on rye from about $1.19 per bushel to $1.42¼. (J. K. R.)

Saar. A German state (*Land*) united with France by monetary (from Nov. 20, 1947) and customs (from April 1, 1948) union, the Saar has an area of 991 sq.mi. Pop. (1950 est.): 943,000. Language: German. Religion: Roman Catholic 75%, Protestant 24%. Capital: Saarbrücken (pop., 1939 est.) 135,000, (June 1947 est.) 97,752. High commissioner of the French republic, Gilbert Granval; prime minister in 1951, Johannes Hoffmann.

History.—The two principal events in the internal life of the Saar in 1951 were the breakup of the coalition and the dissolution by the government of the Democratic party. The two Socialist members of the government—Heinz Braun, minister of justice, and Richard Kirn, minister of labour—resigned on April 9, 1951, over issues connected with social and economic policy. Hoffmann, the prime minister, decided to reduce the size of the government. Later he announced that he himself had taken over the ministry of labour, while Erwin Müller, the new minister of cults, also became minister of justice. Franz Ruland of the Employers' association took over the ministry of economic affairs from a member of the Christian Democratic party. The political life of the Saar gained in liveliness, now that for the first time there was a serious opposition in the *landtag.*

In May the government took the serious step of dissolving the Democratic party. This party had originally had three deputies who resigned from it as it gradually changed character and became the main expression in Saar political life of the wish to return to Germany. The government claimed that it had come under near-nazi control and at any rate conducted its campaigns on an anticonstitutional basis.

There was disappointment in the Saar that by Dec. 1951 there was still a French high commissioner instead of a French diplomatic representative at Saarbrücken as had been promised. Meanwhile, on April 18, the French government had solved the problem of getting both Germany and the Saar into the European Steel and Coal community, by declaring that the French foreign minister's signature covered both France and the Saar. That France was entitled to sign on behalf of the Saar under the Franco-Saar agreement of March 1950 was undisputed, but it had been expected that the French foreign minister would sign twice, once for France and once for the Saar. Hoffmann hurried to Paris to put the Saar point of view to Robert Schuman but the nature of their conversation was not disclosed. Thus the Saarlanders were not only aware of a growing campaign in Germany for the return of the Saar but saw that in certain circumstances the German government could induce the French government to express its claims in the Saar in at least a very cautious manner. This seemed to have had a discouraging effect on the supporters in the Saar of the French connection. On the other hand this connection continued to provide in the Saar full employment throughout the year in striking contrast to the situation in Germany. Both the Christian Democrats and the Socialists had declared against holding another plebiscite in the Saar. (D. R. Gi.)

Economy.—Production in thousand metric tons:

	1950	1949	1948	1936–38
Pig iron	1,692	1,584	1,128	2,280
Steel	1,896	1,756	1,216	2,418
Coal	15,096	14,236	12,474	12,500
Cement	207.6	206.4	159.6	218.4
Gas (million cu.m.)	1,320	1,344	1,164	...
Electricity (million kw.hr.)	1,500	1,524	1,200	1,260

St. Helena.

British colony in the South Atlantic with dependencies of Ascension (34 sq.mi.; pop., 1949, 159) and Tristan da Cunha (13.5 sq.mi.; pop. 231). Colony: area 47.3 sq.mi.; pop. (1949) 4,664. Language: English. Religion: Christian (90% Anglican). Capital: Jamestown (pop. 1,547). Administration: governor; executive council; advisory council. Governor: Sir George Joy.

History.—The flax industry prospered during 1951 and two of the three flax undertakings were taken over from their local owners by a British firm. The growing of lily bulbs suffered a setback from disease but a successful remedy appeared to have been found and it was hoped to resuscitate the industry. On Tristan da Cunha a new fish cannery was brought into operation and the arrival of a new and more suitable fishing vessel improved its prospects. In addition to an administrator, employment and a cash economy, the islands were due to acquire a doctor and an agricultural officer.

Education.—Schools (1949): 11 primary and 1 secondary, 1,242 pupils; 1 domestic science centre.

Finance and Trade.—Currency: sterling. Budget (1951 est.): revenue £103,393; expenditure £107,256. Foreign trade (1950): imports £120,000; exports £140,000 (mostly flax). Production: hemp 1,200 tons. Livestock: 2,357 sheep, 2,140 goats and 870 cattle. (K. G. B.)

St. Kitts-Nevis: *see* Leeward Islands.

St. Laurent, Louis Stephen

(1882–), Canadian statesman, was born on Feb. 1 at Compton, Que.; he was educated at St. Charles college, Sherbrooke, and Laval university, Quebec, Que., and practised law until Dec. 10, 1941, when he entered federal politics as minister of justice and attorney general. He was later secretary of state for external affairs, and on Nov. 15, 1948, became the 17th prime minister of Canada, successor to W. L. Mackenzie King. He was first elected to parliament as Liberal member for Quebec East on Feb. 9, 1942, and was returned in the 1945 and 1949 general elections.

During 1951 St. Laurent led the government in a regular session of parliament and in a special autumn session. In January he attended a meeting of the commonwealth prime ministers in London, Eng.; in September he visited Washington, D.C., to discuss with Pres. Harry S. Truman the deepening of the St. Lawrence seaway; in October he welcomed to Canada Princess Elizabeth and Prince Philip on the occasion of their tour of the country; in December, upon the tenth anniversary of his entry into federal politics, there were parliamentary and other expressions of appreciation transcending political lines, which was unique in Canadian affairs. (*See* Canada.) (C. Cy.)

St. Louis.

St. Louis, Mo., had a population of 856,796 by the 1950 census, with an additional 824,485 in the greater metropolitan area. Mayor in 1951: Joseph M. Darst, Democrat.

At a city election April 3, 1951, the Democratic party strengthened its hold on municipal government by gaining two additional seats on the 29-member board of aldermen, increasing its majority from 15–14 to 17–12, but failed to unseat the Republican board president.

At a special election May 3, 1951, voters increased the school tax 12 cents (from 89 cents to $1.01 on $100 valuation), but narrowly rejected a $17,230,000 school bond issue. Five weeks later the citizens reversed themselves and passed the bond issue; work began on building or improving 17 schools.

St. Louis found its fiscal problems increasing in 1951. A $2,804,995 deficit was reduced to $1,391,671 by the end of the 1950–51 fiscal year (April 10), but during the next eight months governmental costs outran revenues, prompting estimates of a $3,500,000 deficit by April 1952. To increase revenues substan-

YOUNG VISITOR to the St. Louis museum shaking hands with an attendant fitted out in knight's armour during the museum's 1951 exhibit of the Vienna Habsburg art collection tially, the administration was seeking a 1% city earnings tax, authority for which was pending before the Missouri legislature at the close of 1951.

The 1951–52 budget was fixed at $51,977,806, the highest on record, with $41,496,954 for municipal operating expenses. The general tax rate was set at $2.85 on $100, an increase from the previous $2.74 occasioned solely by the additional school tax. The city's real estate and personal property assessed valuation through revisions and new building construction reached an all-time high of $1,324,388,722.

St. Louis became a two-newspaper city (the evening *Post-Dispatch* and morning *Globe-Democrat*) when the *Post-Dispatch* bought and closed its evening competitor, the *Star-Times.*

The Public Service company, privately owned bus and streetcar system, was seeking $2,600,000 added annual revenue through fare increases, though fares had last been increased near the close of 1950. Mayor Darst called the mass transportation system inadequate and proposed some kind of public ownership. At the same time he urged a $75,000,000 modernization program covering a long list of needed public improvements.

(E. L. R.)

St. Lucia: *see* WINDWARD ISLANDS.

St. Pierre and Miquelon.

This group of eight small islands off the south coast of Newfoundland was a former French colony the status of which was changed in 1946 to that of overseas territory. Area: 93 sq.mi. Pop.: (1950 est.) 5,000. Language: French. Religion: Roman Catholic. Chief town: St. Pierre (pop. [1945] 3,636). Administrator: Alain Alaniou.

History.—A company was set up to take advantage of the cold storage available on St. Pierre and to restore the fishing fleet. The fishing industry had in fact declined in importance: 400 of the 5,000 inhabitants were fishermen, and there were 200 boats. Silver-fox breeding went on, though the animals' food, which had to be imported from the mainland, was expensive; the annual output was 2,000 skins. It was suggested that the more lucrative mink could be acclimatized. A geological map was drawn up. An electric generating station was built at St. Pierre. A Socialist was elected deputy on June 17, 1951.

Education.—Schools (1951): pupils, primary 1,123, secondary and technical 70; bursaries in France, 9.

Finance.—Budget (1951 est.): balanced at 283,000,000 fr. C. F. A. Monetary unit, franc C. F. A. (Colonies Françaises d'Afrique) = 2 metropolitan francs. The exchange rate in 1951 for the metropolitan franc was 350 fr. to U.S. $1.

Foreign Trade.—(1950) Imports 347,000,000 fr. C. F. A.; exports 142,000,000 fr. C. F. A. including cod, mainly for the French Antilles, 113,000,000 fr. C. F. A.

Saltonstall, Leverett

(1892–), U.S. senator, was born on Sept. 1 at Chestnut Hill, Mass. He took his bachelor's degree (1914) and his law degree (1917) from Harvard, then served as an artillery officer in France during World War I. Admitted to the Massachusetts bar in 1919, he began practice in Boston. He was assistant district attorney of Middlesex county, Mass., in 1921–22 and a member of the state house of representatives from 1923 to 1936, acting as speaker from 1929 to 1936. From 1939 to 1944 he was governor of Massachusetts. He was elected U.S. senator from Massachusetts as a Republican in 1944 to fill an unexpired term and was re-elected in 1948 for the term 1949–55. On Jan. 3, 1951, he was re-elected senate minority whip.

Saltonstall, mentioned as a possible Republican candidate for president, continued in 1951 to support the bipartisan U.S. foreign policy. He opposed cutting economic aid to Europe and upheld Pres. Harry S. Truman's dismissal of Gen. Douglas MacArthur (though disagreeing with the manner of dismissal). Following the MacArthur hearings, he issued a statement urging that the United States maintain a united front in foreign policy, so that it might keep "the confidence of our friends."

Salvador, El.

A republic on the Pacific coast of Central America, the smallest but most densely populated country on the isthmus, El Salvador has an area of 13,176 sq.mi. and a population (preliminary figures, 1950 census of the Americas) of 1,858,656. The capital is San Salvador (pop., 1948, 124,266). Other principal cities are: Ahuachapán (14,666), Chalchuapa (10,300), Cojutepeque (16,210), Nueva San Salvador (25,684), San Miguel (19,339), San Vicente (14,623), Santa Ana (51,351), Sonsonate (18,898), Suchitoto (10,619), Usulután (9,590) and Zacatecoluca (11,684). Language: Spanish. Religion: predominantly Roman Catholic. President in 1951: Lieut. Col. Oscar Osorio.

History.—Continuing its ambitious reform program, the Osorio administration secured in Jan., 1951, the adoption by the national legislative assembly of fairly comprehensive labour legislation. The measure, which did not apply to agricultural, domestic, contract or self-employed workers, provided for a 44-hour week (8-hour day) for day workers and a 42-hour week (7-hour day) for night workers, with rates of pay 25% higher for night than for day work, and time and a half to be paid for overtime. All workers covered by the law were to have one paid day of rest per week. Child labour provisions limited employment for persons under 16 years of age to a 6-hour day or a 36-hour week.

Constitutional government was interrupted on March 9, when President Osorio declared a state of siege, alleging that a Communist plot to overthrow the government had been unearthed. On March 15, 23 Salvadoran opposition leaders deported by Osorio were granted sanctuary by Nicaragua.

The Salvadoran foreign office issued invitations in September to the foreign ministers of Costa Rica, Guatemala, Nicaragua and Honduras to meet at San Salvador for the purpose of providing for periodic meetings of the Central American foreign ministers, establishing specific commissions to deal with particular problems and creating an international organization of Central American states. The conference opened on Oct. 8 and adjourned several days later after the delegates signed a "Charter of Salvador," providing for a new Organization of Central American States "to promote fraternal bonds by group action and to study solutions for common problems." The instrument pledged each signatory state to maintain friendly relations with the others. Panamá, which was not represented at the conference, was invited to adhere to the charter.

Southeastern El Salvador was rocked by earthquakes on May 6–7. The disaster affected 11 towns, the hardest hit being Jucuapa (pop., 14,000), where every building was rendered uninhabitable. The death toll, at first feared to reach 1,000, was eventually put at 375, and about 25,000 were left homeless.

(G. I. B.)

Education.—In 1949 there were 1,980 primary schools with 4,763 teachers and 110,901 pupils. Secondary schools numbered 48 in 1950 with about 6,500 students. The national university had 1,120 students and 147 faculty members in 1949. About 14% of the 1951 budget was allocated to public education. In 1951 there were 30 motion-picture theatres with seating capacity of 40,782.

Finance.—The monetary unit is the colón, valued at 40 cents U.S. currency in 1951. In 1950 ordinary governmental expenditure was $35,395,579; revenue, $35,347,019. Because of surpluses in previous years the fiscal surplus as of Dec. 31, 1950, was $2,380,193. The 1951 budget was placed at $44,000,000. The public debt as of Dec. 31, 1950, was $10,381,805, all of which was external. On Oct. 31, 1951, currency in circulation totalled 73,490,000 colones; demand deposits 62,640,000 colones; time deposits 1,860,000 colones; government deposits 19,870,000 colones; gold reserves $25,760,000; foreign exchange $22,120,000. The cost-of-living index (food, San Salvador) stood at 239 in Dec. 1950 (1937=100).

Trade and Communications.—Exports in 1950 totalled $69,501,512; imports, $47,230,966. Leading exports were coffee (88%), gold, sugar and silver. Principal customers were the U.S. (86%), Italy (3%), Guatemala (2%) and the United Kingdom (2%). The U.S. supplied about 65% of the imports; other important suppliers were Honduras, the United Kingdom and Canada.

The two principal railroads have 385 mi. of main line track, all narrow gauge. In 1950, 3,403,261 passengers and 458,760 short tons of freight were carried. National highway mileage (1950) was 1,693, of which 934 mi. were all-weather. The two international air lines made 3,535 flights into El Salvador in 1950.

Agriculture.—In the 1950–51 season coffee production totalled 1,111,855 bags of 132 lb. each; exports in 1950 were 1,107,979 bags, of which 1,039,226 bags went to the U.S. Centrifugal sugar production (plantation) was 29,000 short tons in 1950–51; sesame seed 4,600 tons; maize 156,000 tons; cotton (ginned) 6,500 tons. Production of balsam, of which El Salvador is the chief source, was estimated at 165,000 lb. in 1950. There were an estimated 800,000 cattle, 350,000 pigs and 22,000 sheep and goats in 1950.

Mineral Production.—In 1950, 32,470 troy oz. of gold and 460,496 oz. of silver were exported. (J. W. Mw.)

Salvation Army.

The Salvation Army, a world-wide religious and charitable organization, had corps and outposts in 89 countries and territories throughout the world in 1951. Its 17,119 corps (local units) included 26,803 commissioned officers, 99,952 local officers (laymen) and thousands of soldiers (members) and adherents.

The International Salvation Army was commanded in 1951 by Gen. Albert Orsborn, the sixth general, elected on June 21, 1946, with headquarters in London. In the United States, Commissioner Ernest I. Pugmire was the national commander, with headquarters in New York city.

With the reactivation of the United Service Organizations (U.S.O.) in May 1951, the Salvation Army, one of its seven member agencies, resumed its work of providing religious, recreational and welfare assistance to the members of the armed forces, many of whom were accompanied by their families. Sixteen U.S.O. clubs were operated by the Salvation Army during 1951.

The Salvation Army's disaster service units in the midwest were quickly pressed into action when the rising waters of the Missouri overflowed in July 1951 to cause one of the costliest and most destructive floods in the nation's history. Quick and effective help was rendered to hundreds of homeless victims by the Salvation Army's specially trained workers and volunteers.

Operation of the rural and extension service plan, a development of a Salvation Army activity instituted more than 25 years earlier, was announced toward the latter part of the year. The program was geared especially to meet the needs of small communities and rural areas, and the types of service ranged from medical and dental care, summer camp benefits and care for unwed mothers, to the supplying of fuel, food and clothing for the destitute.

In the United States during 1951 the Salvation Army held 98,417 meetings on street corners. In its social service program, 20,475 patients were treated in 7 clinics and dispensaries; 1,349 missing persons were located; 34 maternity homes and hospitals for unwed mothers cared for 11,884 women and children; 48,683 mothers and children were sent to summer camps. A total of 105 men's social service centres provided shelter and work for 30,814 men.

In the field of prison work, 9,266 prisoners were assisted on discharge and given employment; 2,129 prisoners were paroled in care of the Salvation Army, whose officers devoted 6,962 hours to prison visitation. (*See* also CHURCH MEMBERSHIP.)

(E. I. P.)

Samoa, American.

The Samoan Islands extend from lat. 13° 26′ to 14° 22′ S. and from long. 168° 10′ to 172° 48′ W., and are about 2,700 mi. E. of Australia and 2,200 mi. S. of the Hawaiian Islands. American Samoa consists of the inhabited islands of Tutuila, Tau, Olosega, Ofu and Aunuu and the uninhabited coral atoll Rose Island. Swain's Island, 210 mi. N.W. of Tutuila, was made a part of American Samoa in 1925. Total area of American Samoa is 76 sq.mi. and total population as of June 30, 1951, was estimated at 19,000 with about four-fifths of the population on the main island of Tutuila. Pago Pago, on Tutuila, is the capital.

History.—American Samoa, an unorganized U.S. possession, was administered until July 1, 1951, by the U.S. navy. Capt. Thomas F. Darden, Jr., appointed governor in 1949, was the last naval officer to hold that post. By order of Pres. Harry S. Truman, administration of American Samoa was transferred to the jurisdiction of the department of the interior on July 1, 1951. In contemplation of this change, the U.S. naval station at Tutuila was disestablished on Dec. 31, 1949, and replaced by a naval government unit. On Jan. 22, 1951, Phelps Phelps, former New York state legislator, was appointed governor.

Education.—Education is compulsory for all children from 7 to 15 years of age, inclusive. It was estimated in 1950 that 93% of all persons 10 years of age or older were literate. As of June 30, 1951, there were 5,301 children enrolled in 53 public and 6 private schools with a total of 208 teachers. Of the public schools 46 were elementary, 5 junior high, 1 senior high and 1 vocational.

Production and Trade.—The economy of American Samoa is basically on a subsistence level. The main products of American Samoa are copra and native handicraft, principally pandanus mats and rugs woven from grass. Principal crops, with estimated 1950 production, were copra (2,403 metric tons), breadfruit (7,700 metric tons), bananas (19,492 metric tons) and taro (2,900 metric tons). There were approximately 200 to 250 cattle and 200 to 250 horses in American Samoa in 1951. Imports in the fiscal year ending June 30, 1951, totalled $790,978; the major imports by volume were preserved meat and textiles. Exports totalled $197,655; two-thirds of the exports were copra. Total revenues collected during the 1950–51 fiscal year amounted to $397,009, in addition to a U.S. government appropriation of $21,000; expenditures amounted to $632,001. The difference between revenues and expenditures represented funds taken from a surplus fund that had accumulated during World War II. The Bank of American Samoa, which is operated by the American Trust company of California, is American Samoa's only banking institution.

Transportation.—Tutuila has 65 mi. of roads, 51 mi. of footpaths and a 6,000-ft. coral-surfaced air strip, no longer in use.

BIBLIOGRAPHY.—U.S. Navy Department, *American Samoa; Information Transmitted by the U.S. to the Secretary-General of the U.N. Pursuant to Article 73(e) of the Charter* (June 1951); U.S. Department of Agriculture, *Annual Report of the Government of the United States of America to the Food and Agriculture Organization of the United Nations* (July 1951). San Francisco.

Population of the city of San Francisco, Calif., on April 1, 1950 (U.S. census) was 775,357, compared to 634,536 in 1940. Mayor Elmer E. Robinson was re-elected for another 4-year term beginning January 8, 1952.

General business activity in San Francisco during 1951 exceeded that of any other year on record, based on the 11 months activity which showed substantial growth, with general business 13.8% above 1950. Financial transactions were up 18.6%; industrial production 10%; retail department store sales 5%; electrical energy sales 8.8%; freight car movements 8.9%; port revenue tonnage 7.8%; cargo ship arrivals 11.8%; San Francisco airport traffic, planes 24% and passengers 20%; vehicle crossings on Bay bridge 4.5% and Golden Gate bridge 11.2%. Placements in San Francisco for the 11 months rose 28.5% to a total of 37,499, based on reports from the California state employment service. Bank debits attained a new high of $32,837,465,000 or $5,100,000,000 above 1950; postal receipts rose $4,300,000; and shares traded on the San Francisco stock exchange increased 3,700,000; market value, however, was down $19,300,000.

During the first 11 months, 7,436 building permits were issued amounting to $50,802,260. Under restricted credit and material regulations, the total value of building permits dropped 25%

with residential off 52% and nonresidential 20%. Additions, alterations and repairs, however, increased 25%. New residential permits provided 1,594 dwelling units.

Retail sales were approximately the same as the 1950 total of $1,351,651,000. Wholesale trade reflected the Pacific coast trend which was up 11% compared to 9% in the nation.

The consumers' price index three-quarterly average for San Francisco of 188.5 (1935–1939=100 base) was 8.6% above a similar period of 1950. About 95 new industries and expansions in San Francisco during 1951 made outlays of $10,000,000, and about 500 in the bay area outlays of $160,000,000.

The San Francisco tax rate for the fiscal year 1951–52 was $6.19 per $100. The assessment roll amounted to $1,730,572,685. Estimated fiscal year revenues amounted to $161,328,430, of which $70,224,644 was to come from city taxes. The bonded debt limit as of Dec. 31, 1951, amounted to $207,668,722. Bonds outstanding and not matured on Dec. 31, 1951, amounted to $173,017,000.

The margin for future bond sales amounted to $113,014,722. Bonds authorized but unsold as of Dec. 31, 1951, amounted to $69,500,000. (R. B. Kr.)

San Marino. A small republic in central Italy, San Marino is surrounded by the province of Emilia and is situated on the slopes of Mt. Titano, 14 mi. S.W. of Rimini. Area: 38 sq.mi. Pop. (June 30, 1951, est.): 12,969. Language: Italian. Religion: Roman Catholic. San Marino is governed by two *capitani reggenti* appointed every six months by a grand and general council of 60 members elected by universal suffrage every four years.

Regents: (April–Sept. 1951) Alvaro Casali and Giordano Giacomini; (Oct. 1951–March 1952) Domenico Forcellini and Giovanni Terenzi.

History.—The two-year-old quarrel between San Marino and Italy was partly settled during 1951. In Aug. San Marino closed its gaming house, which, incidentally, was a competitor to similar establishments at Venice and San Remo; the Italian government agreed to pay San Marino 150,000,000 lire of which one-third was provided immediately.

Although a new election was not due until 1953, the *consiglio grande e generale* on June 30 unanimously voted its own dissolution. The voting took place on Sept. 16 and the results were as follows: People's Democrats (Communists and Socialists), 2,297 votes and 31 seats; Christian Democrats 1,922 votes and 26 seats; Neo-Fascists 248 votes and 3 seats. Although the Communist-controlled majority was reduced from 10 to 2, it retained the control of the administration.

By the end of the year there were still questions outstanding between Italy and San Marino including the establishment of businesses by Italians in the republic to avoid Italian taxation.

Education.—During the scholastic year 1950–51 there were 1,431 pupils in primary schools and 190 in secondary.

Finance.—Budget (1951–52 est.): provisionally balanced at 570,411,538 lire. San Marino uses Italian currency.

Sarawak: *see* British Borneo.

Saskatchewan. Central of three prairie provinces of Canada, Saskatchewan was created in 1905. Area: 251,700 sq.mi. of which 13,725 are water. Pop. (1941) 895,922; (1951 preliminary census) 829,175. Capital: Regina (pop. 1951) 69,928.

History.—The 3rd session of the 11th legislature prorogued on April 5, after passing 108 bills, including a redistribution act which added a new northern constituency and raised legislature membership to 53. An upswing of support for Premier Thomas Douglas' Co-operative Commonwealth Federation (Socialist) government was found in the loss by the Liberals of the Gravelbourg seat in a provincial by-election, and in the growth of C.C.F. provincial party membership after a loss of 10,000 in the 1949–50 period. A special session of the legislature in December was called to permit a federal-provincial means test pension of $40 to the 65–69 age group. When J. M. Uhrich died in June, former premier W. J. Patterson became the province's tenth lieutenant governor.

Education.—Revised statistics for provincially controlled schools were for 1948: total enrolment 168,605; average daily attendance 135,927; teachers 7,141; total revenue $20,919,385.

Public Welfare.—On Jan. 1, 1951, there were (under the provincial health services plan) 6,398 hospital beds, the highest per capita (6.5) in Canada. In 1950 the hospital service plan cost $11,948,620; total revenue from the hospitalization tax was $6,015,905. New minimum wage rates were set at $24 per week (instead of $21) for full-time workers, higher than in any other province.

Transportation.—The department of highways undertook a $13,380,000 improvement program for 1951, to include 223 mi. of black topping (compared to 118 mi. for 1950). In 1950 there were 735 mi. of such improvement. The Saskatchewan government airways reported a 50% improvement in operations for 1950 over 1949.

Finance.—Estimated revenues for the 1951–52 fiscal year were $58,221,810, and expenditures $57,911,850. There were no new taxes or increases in rates. Net provincial debt on Dec. 31, 1950, was $147,943,674 ($169 per capita, compared to $254 per capita in 1944).

Agriculture.—Faced with a depletion of tillable land, the provincial government spent more than $500,000 clearing and draining land for new farm units; about $2,600,000 of treasury money was earmarked for the development in 1951–52 of the agriculture industry, plus $750,000 for capital expansions. Statistics for 1950 were: total field crops $440,472,000 from 21,383,000 ac.; wheat 260,000,000 bu.; total livestock products $130,303,000; total farm cash income $407,604,000.

Fisheries.—After being closed to commercial fishing for five years, Lake Athabasca was opened to a catch limit of 1,500,000 lb. The provincial government moved to encourage the creation of fish co-operatives in the north country.

Forestry.—Total value of timber production for the year ending March 31, 1951, was $9,758,000, compared with $4,089,000 for the previous year.

Industry.—Best indication of the erratic, yet progressive, expansion of industry was comparison of annual manufacturing investment figures for the 1948–51 period, as follows: $6,000,000, $11,000,000, $8,000,000, $14,000,000. The 1951 figure was 5.8% of the total planned $240,100,000 investment for all purposes. To some extent industrial expansion in Saskatchewan was modified by the Socialist government's operation of 13 business corporations, of which about half were active in wool, power, forest products, sodium sulphate, brick and leather production. In the year ending March 31, 1950, the crown corporations made a net profit of $3,815,859.

Minerals.—About $25,000,000 was spent on oil explorations; 45 geophysical crews were active; more than 140 wells were sunk; and more than 200 core holes drilled. Most of the activity was in the Williston basin and in the Kindersley area. Under new regulations the provincial government reserved as much as 60% of the oil area involved (previously 25%), and took control of all natural gas sales. A rich uranium find on Lake Athabasca was slated for 1953 production, and Uranium City was being built at Beaverlodge lake for exploitation of the uranium find there. About 30 companies combed the north country for more uranium deposits. Top quality feldspar was found near Lac la Ronge. Development of a 100,000 ac. potash deposit near Unity was begun. (C. Cy.)

Sawyer, Charles (1887–), U.S. secretary of commerce, was born on Feb. 10 in Cincinnati, O. He studied at Oberlin college, Oberlin, O., and at the University of Cincinnati, and was admitted to the bar in Ohio in 1911. The same year he was elected to the Cincinnati city council. From 1921 on he was a member of the law firm of Dinsmore, Shohl, Sawyer and Dinsmore. He served as lieutenant governor of Ohio beginning in 1933, and won the Democratic nomination for governor in 1938, but was defeated in the election by John W. Bricker. In 1944–45 he served as U.S. ambassador to Belgium and minister to Luxembourg. He became secretary of commerce on May 6, 1948.

In 1951 Secretary Sawyer was under the fire of Sen. Herbert R. O'Conor (D. Md.) on charges that Sawyer had not halted exports to red China until O'Conor's senate commerce subcommittee had virtually forced him to do so. He was also the centre of legal action to force him and other U.S. officials to return the American President Lines to the R. Stanley Dollar interests, he having been instructed by Pres. Harry S. Truman not to do so on grounds that there was doubt as to the propriety of the move. On July 22 Secretary Sawyer, commenting on Sen. Paul Douglas' proposal to set up a commission on ethics in the federal government, wrote: "Any man who must look up his code of ethics to find out what is proper or improper for him to do is too innocent to be around Washington."

Schuman, Robert (1886–), French foreign minister, was born at Luxembourg, June 29, of a Lorraine family. Called to the bar in Metz before World War I, he was elected a deputy for the recovered Moselle *département* in 1919 and was afterward continuously re-elected. In the Paul Reynaud government of March 1940 he was made undersecretary responsible for refugees from Alsace-Lorraine. His activities on behalf of Lorrainers led to his arrest by the gestapo in April 1941 but he escaped from imprisonment in Germany in Aug. 1942 and went into hiding in France. Schuman attended the conference of French and Italian prime ministers and foreign ministers at Santa Margherita, It., Feb. 12–14, 1951, which discussed relations between the two countries. He arrived in Washington, D.C., with Pres. Vincent Auriol on March 28 and had talks with Dean Acheson, secretary of state; he accompanied Auriol to Canada and returned to Paris on April 10. He signed in Paris on April 18 the treaty on the European coal and steel pool which had been known as the Schuman plan since he launched the proposal in May 1950. He went to San Francisco, Calif., to sign the Japanese peace treaty on Sept. 8 and on Sept. 11–14 had meetings in Washington first with Acheson and then with Herbert Morrison, the British foreign secretary, and Acheson together. He went on to Ottawa for the North Atlantic council meeting which started on Sept. 15 and returned to Paris on Sept. 23.

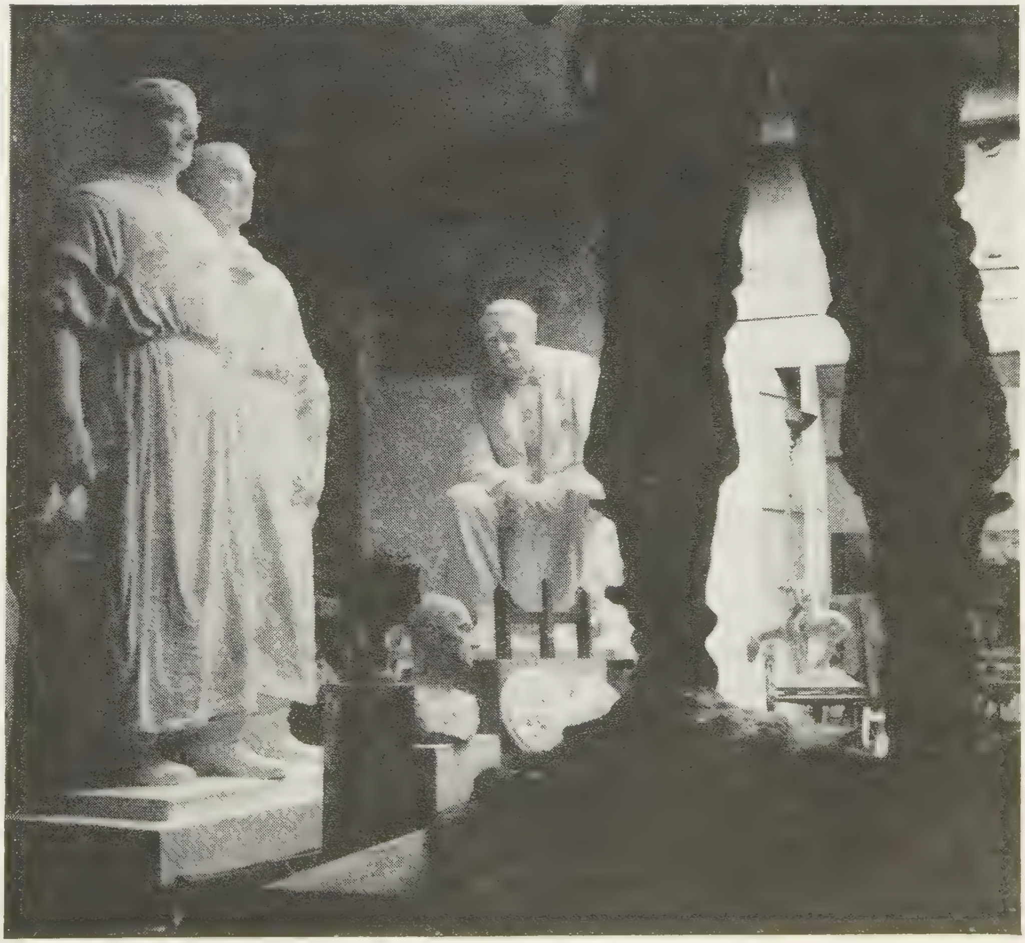
Sculpture. The condition of sculpture, sometimes cynically described "the orphan of the arts," continued healthy in 1951, with production most active in the hands of artists working in the creative sphere, aiming to have their work exhibited and recognized for its vital contribution to contemporary art. Change in over-all status is not as perceptible in the arts as in other fields of production, and one year's trends run more or less in sequence with those of the preceding year. Sculpture was affected by a larger concerted effort toward promotion and popularization, a nation-wide roundup of work for exhibition being an important event of the year.

In the United States, as elsewhere, continuance of production in two main courses—the experimental and abstract on one hand, and classical and humanist on the other—determined vital differences. Besides aesthetic concern, concern with promotional and economic factors—following protest and demand for contemporary recognition from even the most conservative institutions—was shown by the Metropolitan Museum of Art in the organization of a new, extensive sculpture survey, and was continued by other museums in New York and other U.S. cities. The greatest disappointment was that these surveys showed too little from a national competition which was drastically pared down in final form from hundreds of submissions to a relatively few exhibits. Except in their local milieu sculptors in general found it difficult to reach the public with their work.

Jacques Lipchitz, whose "Sculpture in Progress" exhibit was notably well received, showed a monumental "Birth of Venus" design for a New York collector illustrated by models and photographs of the details of the work in progress. Theodore Roszak demonstrated by work in the expressionist field that he was one of the craft's more inventive figures. Recognition was accorded to the achievements of Gerhard Marcks in Germany, and a comprehensive group of his work was shown in New York city, centring around his monumental "Maja" figure earlier acquired by the Philadelphia museum.

In South America, the international exchange of exhibits was furthered with U.S. co-operation. Especially notable was the contribution of U.S. sculptors to the newly established Brazil biennial exhibition of paintings and sculpture in São Paulo. Theodore Roszak's design was second among the prize winners, while first prize was taken by Max Bill, Swiss sculptor.



PLASTER MODELS in the crowded studio of James Earle Fraser, who was awarded the gold medal of the American Academy and National Institute of Arts and Letters on May 25, 1951. Left to right: the Mayo brothers in surgeons' gowns, Thomas Edison (seated), part of a gigantic figure of Gen. George S. Patton, Jr., and, right background, "The End of the Trail"

In the U.S., progress with relief sculpture was shown by the "advance guard" in works no longer created in close unity with the architectural setting, as often in traditional practice, but in free standing objects of decoration considered suitable to modern buildings when functioning as a screen. Designs involved new techniques and constructions in steel, aluminum and other materials in harmony with modern architecture.

Less emphasis on the wall, "no longer figuring as a supporting element, but an enclosing screen" was demonstrated by Isamu Noguchi in his design for a ceiling decoration for a building in St. Louis, Mo., together with abstract designs by Naum Gabo for one in New York, and Jean Arp for a dormitory dining room at Harvard.

Possibilities in the use of fused, brazed and forged metal concepts for symbolical sculpture were exploited further by David Smith, David Hare, Ibrim Lassaw and Leo Amino, the latter also employing plastic materials. A question arose regarding the future availability of copper for bronze sculpture as the result of restrictive action by the National Production authority. After investigation by the National Sculpture society, the profession was reassured by an interpretation of a ruling which showed that copper for bronze work was off the list of controls and in the forseeable future would not be curtailed.

In the field of monumental sculpture, four heroic equestrian groups designed by James Earle Fraser and Leo Friedlander for the plaza of the Arlington Memorial bridge, Washington, D.C., were cast in bronze in Italy as the gift of the Italian government and were put in place, the groups representing the arts of war and peace. Fraser, noted as a traditionalist sculptor for his "End of the Trail" and noted Buffalo nickel designs, received the gold medal award for achievement from the American Academy and National Institute of Arts and Letters, and together with Friedlander the medal of honor of the National Sculpture society.

In Israel, Jo Davidson, internationally known portrait sculptor, completed busts of Israeli leaders, including Pres. Chaim Weizmann, Prime Minister David Ben-Gurion and four of the Israel cabinet, as well as types of immigrants to that country. Paul Manship completed his monumental realist group of two young soldiers, "Buddies," which shortly was to be seen on display in the Metropolitan museum's competitive sculpture show.

First Metropolitan sculpture prize was awarded to Minna Harkavy, Esthonian-born American sculptress for her "Two Men." The exhibit of her work struck a style midway between the nonobjective and the realistic work which marked the extremes of the exhibit. (*See* also ART EXHIBITIONS.)

Seaborg, Glenn Theodore

(1912–). U.S. scientist, was born on April 19 at Ishpeming, Mich. He received his B.A. degree from the University of California at Los Angeles in 1934 and his Ph.D. from the University of California, Berkeley, in 1937. Appointed research associate in chemistry at the University of California in 1937, he advanced to the rank of full professor in 1945. From 1942 to 1946 he was on leave at The University of Chicago Metallurgical laboratory, where the atomic bomb was developed. Seaborg had a major role in its development, as head of the laboratory's chemical separation section.

With Edwin M. McMillan (*q.v.*), Seaborg in the 1930s had conducted the basic research which led in 1940 to the discovery of plutonium (element 94). He and his associates later went on to discover elements 95 (americium), 96 (curium), 97 (berkelium) and 98 (californium). It was reportedly at the insistence of Seaborg and Arthur H. Compton that plutonium rather than uranium was selected as the source of power for the first experiments on production of the atomic bomb. Seaborg was named a member of the general advisory committee of the U.S. Atomic Energy commission in 1946. In the same year, upon his return to the University of California, he was appointed director of chemical research at the university's radiation laboratory.

On Nov. 15, 1951, Seaborg and McMillan were named corecipients of the 1951 Nobel prize in chemistry.

*Secondary metal recovered from old materials, the remainder having come from the reworking of new plant scrap. †Other platinum group metals.

There were heavy increases in recoveries in 1950, but it must be remembered that only recoveries from old scrap add to the current supply.

Iron and Steel Scrap.—Scrap is an essential constituent of the charge in the modern steel furnace, and whenever the demand for steel is high the scrap supply runs short. There had been a chronic shortage of scrap since 1939, and as a result there was a growing trend toward decreased consumption. In

Table II.—*Scrap in the U.S. Iron and Steel Industry*

(In thousands of short tons)

	Pig iron output	Steel output	Scrap consumption

1939 1 ton of scrap made 1.27 tons of steel, but by 1950 the yield of steel per ton of scrap had increased to 1.575 tons.

(G. A. Ro.)

Secret Service, U.S.

During 1951 the powers and duties of this treasury department bureau were defined in permanent law for the first time since the agency was established in 1865. Basic authority for secret service functions was derived from annual appropriation acts until July 16, 1951, when the president approved public law 79, 82nd congress, amending title 18 U.S. code, section 3056, authorizing the secret service to protect the person of the president of the United States and members of his immediate family, the president-elect, and the vice president at his request; to detect and arrest any person committing any offense against the laws of the United States relating to coins, obligations and securities of the United States and of foreign governments; to detect and arrest any person violating any laws of the United States directly concerning official matters administered by and under the direct control of the treasury department; and to perform other stated duties.

During the year, Oscar Collazo, Puerto Rican nationalist, who was wounded Nov. 1, 1950, in a gun battle when he and Griselio Torresola attempted to shoot their way into the Blair house, temporary home of the president, was convicted of the murder of a White House police officer and sentenced to death.

The uniformed force of the secret service safeguarded more than $227,000,000,000 of currency, stamps and other obligations in transit, and more than $549,000,000,000 of securities in production and storage.

Increased activity in the forgery of Government checks was caused partly by the fact that drug addicts were stealing and negotiating checks to buy narcotics. During the year the secret service received for investigation 32,738 forged checks and 5,975 forged bonds. Special agents arrested 2,288 forgers and investigated 38,102 forged government checks worth $2,752,493.94.

Secret service agents captured $1,430,931 in counterfeit bills and $8,505.35 in counterfeit coins, a total of $1,439,436.35. Of this amount, $918,249.15 was seized before it could be passed on the public. The balance represented losses to merchants and others. Special agents arrested 307 persons charged with counterfeiting offenses and captured seven plants for the manufacture of 101 issues of new counterfeit bills. There were 144 new counterfeit note issues during the year, 94 of which were of foreign origin.

Arrests for all offenses totalled 2,772 and there were 2,507 convictions in cases of all types, representing 98.8% of convictions in the cases which went to trial. Prison sentences totalled 2,878 years and additional sentences of 2,590 years were suspended or probated. Fines in criminal cases totalled $141,485.88.

(U. E. B.)

Securities: *see* STOCKS AND BONDS.

Securities and Exchange Commission.

A bipartisan, quasi-judicial agency of the U.S. government, the Securities and Exchange commission (SEC) administers several laws in the general field of securities and finance enacted for the protection of the investing public.

Securities Act of 1933.—This law prohibits fraud and deceit in the sale of securities generally, and requires disclosure of financial and other information concerning securities offered for public sale.

Prior to such public offering of securities, they must be registered with the commission through the filing of a statement containing prescribed data; and a prospectus summarizing the salient information must be delivered to investors. By the close of 1951, $65,900,000,000 of securities had been so registered, $6,500,000,000 during the fiscal year ended June 30, 1951.

Registration of securities does not guarantee against loss in their purchase. It merely seeks to provide investors with information upon which they can exercise an informed judgment as to the worth of the securities and thus avoid imprudent investments. Nor is registration a warranty of the accuracy of the facts disclosed; but investors who suffer losses in the purchase of registered securities have important recovery rights if material facts are proven false.

Securities Exchange Act of 1934.—Issuers of securities listed for public trading on the national securities exchanges are required by this law to register and file annual and other periodic reports with the commission and the exchanges providing disclosure of data essential to investment analyses. At the year's end, 3,523 security issues of 2,188 listed companies were so registered. The volume of trading therein during the year was $24,000,000,000.

Holders of listed securities also must be provided with pertinent information when their proxies are solicited on corporate matters. Management officials and large stockholders of listed companies must report their holdings of and transactions in listed and other equity securities of their companies and are accountable to the issuer for short-term trading profits therein—measures designed to curb misuse of "inside" information. During the year, 1,788 proxy statements and 22,118 insiders' trading reports were filed.

The law further provides a system for the regulation of securities markets designed to eliminate all impediments to free and open markets truly reflective of the law of supply and demand and the composite judgment of investors as to the worth of securities. Exchanges as well as persons or firms engaged in an over-the-counter securities business must register and conform their business practices to standards designed for the protection of investors. Sixteen exchanges and 3,954 brokers and dealers were so registered at the close of 1951, as was one association of brokers and dealers organized for self-policing purposes in the over-the-counter markets. Exchanges and the association have disciplinary powers over their members for malpractices.

Provisions of this law and the Securities act prohibiting fraud and deceit, manipulation and other abusive practices in the purchase and sale of securities are buttressed by SEC powers of investigation and enforcement (which include the right to subpoena witnesses and documentary evidence). Sanctions include injunctions and criminal prosecution, as well as commission orders temporarily or permanently barring persons or firms from the securities business if, after hearing, the commission finds that the respondent has defrauded customers or otherwise wilfully violated the securities laws.

The securities laws and their administration on the one hand and, on the other, improved standards of business conduct both in the securities business and among corporate officials, operate to restore investor confidence in securities which is essential to a strong and healthy capitalistic economy.

Public Utility Holding Company Act of 1935.—This law provides for regulation of the financial and related practices of electric and gas public utility holding company systems. It further calls for major readjustments in the corporate and capital structures of system companies to the end: (1) that their operations shall be confined to an integrated group of utility properties within a limited area; and (2) that pyramided corporate and complicated capital structures shall be simplified and voting power redistributed among security holders on an equitable basis.

These readjustments have generally taken the form of commission-approved plans for the sale of securities of nonretainable companies or of their underlying assets, or the distribution of such portfolio securities to security holders; or plans of reorganization, merger, consolidation, dissolution and similar actions. Initially, 54 holding company systems were registered, consisting of 177 holding companies, 751 utility companies and 644 nonutility companies. Some of the larger systems had properties scattered throughout the country. In 1951 the 40 remaining systems were composed of 64 holding companies, 195 electric and gas utility companies and 185 nonutility companies; and their combined assets were only $1,000,000,000 less than the $14,000,000,000 figure for the original 54 systems, a fact attesting not alone to the unprecedented growth of the utility industry in recent years but also to the pattern of integration which permitted particular systems to acquire and integrate with their own those properties found not retainable as part of another's integrated system.

Many who opposed passage of the law predicted that it would cause a demoralization of the market for utility securities. The exact reverse was true. Commission studies showed increases of 117%, 439% and 478% in the average market value of all securities of particular holding companies, as against a corresponding increase of from 40% to 45% in the Dow Jones industrials average, while the market for the common stocks of the three companies increased 226%, 483% and 914%. Although there were other contributing factors, much of the improvement might fairly be ascribed to the salutory effects of the Holding Company act.

To safeguard investors in new security issues of system companies, the law specifies certain minimum standards which must be met in their issuance and sale, including reasonable underwriting and other fees, and requires the maintenance of balanced security structures. During 1948–51 alone, the commission passed upon the issuance and sale of $4,400,000,000 of utility securities, the bulk of the proceeds of which were applied to construction. The commission's jurisdiction also extends to sales of portfolio securities; purchases and sales of utility assets; intercompany transactions; service contracts; accounting; dividends; and similar matters.

The commission also administers: (1) the Trust Indenture act of 1939, governing the terms of indentures under which debt securities are issued and prescribing minimum qualifications of the indenture trustee who is to serve as the investors' representative; (2) the Investment Company act of 1940, containing regulatory provisions governing certain phases of the operations of investment companies (of which 368 were registered in 1951); and (3) the Investment Advisers act of 1940, which prescribes certain minimum standards of conduct applicable to those who are engaged in the business of advising others with respect to their investments (of which 1,057 were registered in 1951). The commission also serves as adviser to federal courts in corporate reorganization proceedings under chapter x of the Bankruptcy act, particularly with respect to the fairness and feasibility of plans for reorganization of debtor corporations. (O. L. Ds.)

Seeing Eye, Inc.: *see* SOCIETIES AND ASSOCIATIONS, U.S.

Seismology.

The most destructive earthquake of 1951 occurred in El Salvador on May 6 when at least 375 persons in the towns of Jucuapa, Chinameca and nearby villages were killed, and about 25,000 made homeless. Many countries sent aid. In Cankiri, Turk., 44 were killed on Aug. 13, and on Oct. 22 a casualty list of 28 dead and 100 injured was reported from the Hualien area of Formosa. At Terminal Island near Long Beach, Calif., a light seismic disturbance on Aug. 15 caused $2,000,000 damage to oil wells—about one-fourth the damage caused by a similar disturbance in Nov. 1949. Mechernich, Ger., reported $300,000 damage from a shock on March 15 that ruined many war-damaged buildings. In the Hawaiian Islands a strong submarine disturbance southwest of the island of Hawaii wrecked many houses and tumbled cliffs on the Kona coast. In the United States activity outside the seismic areas of the Pacific coast was marked by a widespread shock in western Texas and several in New England and New York state that broke windows and glassware. Seismograph recordings revealed that one of the strongest earthquakes of the year occurred in eastern Tibet on Nov. 18 not far from the scene of the great 1950 shock that was among the three greatest recorded on modern seismographs. A slightly stronger submarine shock was located southeast of Madagascar on Dec. 8. A series of strong shocks off the east and southeast coasts of Formosa indicated a major readjustment of basement rock in that area.

In the United States new seismograph stations were established at the University of Arkansas in Fayetteville and at Nelson, Nev. near Lake Mead. Five new stations were established in foreign countries. Progress in engineering research was highlighted by completion of a comprehensive mathematical analysis of strong-motion seismograph records at the California Institute of Technology that would greatly facilitate the prediction of earthquake stresses in structures—a problem still in the research stage. All important instrumental records of destructive earthquake motions obtained by the U.S. coast and geodetic survey over an 18-year period were processed on the electrical analogue computer of the institute. Survey seismologists advanced new concepts of the nature of destructive earthquake motions.

The aerological branch of the navy continued its field and laboratory investigations of microseismic phenomena as related to the tracking of hurricanes and other low pressure areas. New instrumental and analytical techniques were advanced to improve accuracy. A seismological research group of Columbia university expanded its seismic surveys of the ocean bottom off the Atlantic to outline the extent and depth of the ocean sediments and the structure of the rock beneath. The U.S. coast and geodetic survey through the international exchange of seismological telegrams was enabled to make immediate and reliable announcements of the locations of all important earthquakes. (*See* also COAST AND GEODETIC SURVEY, U.S.; DISASTERS.)

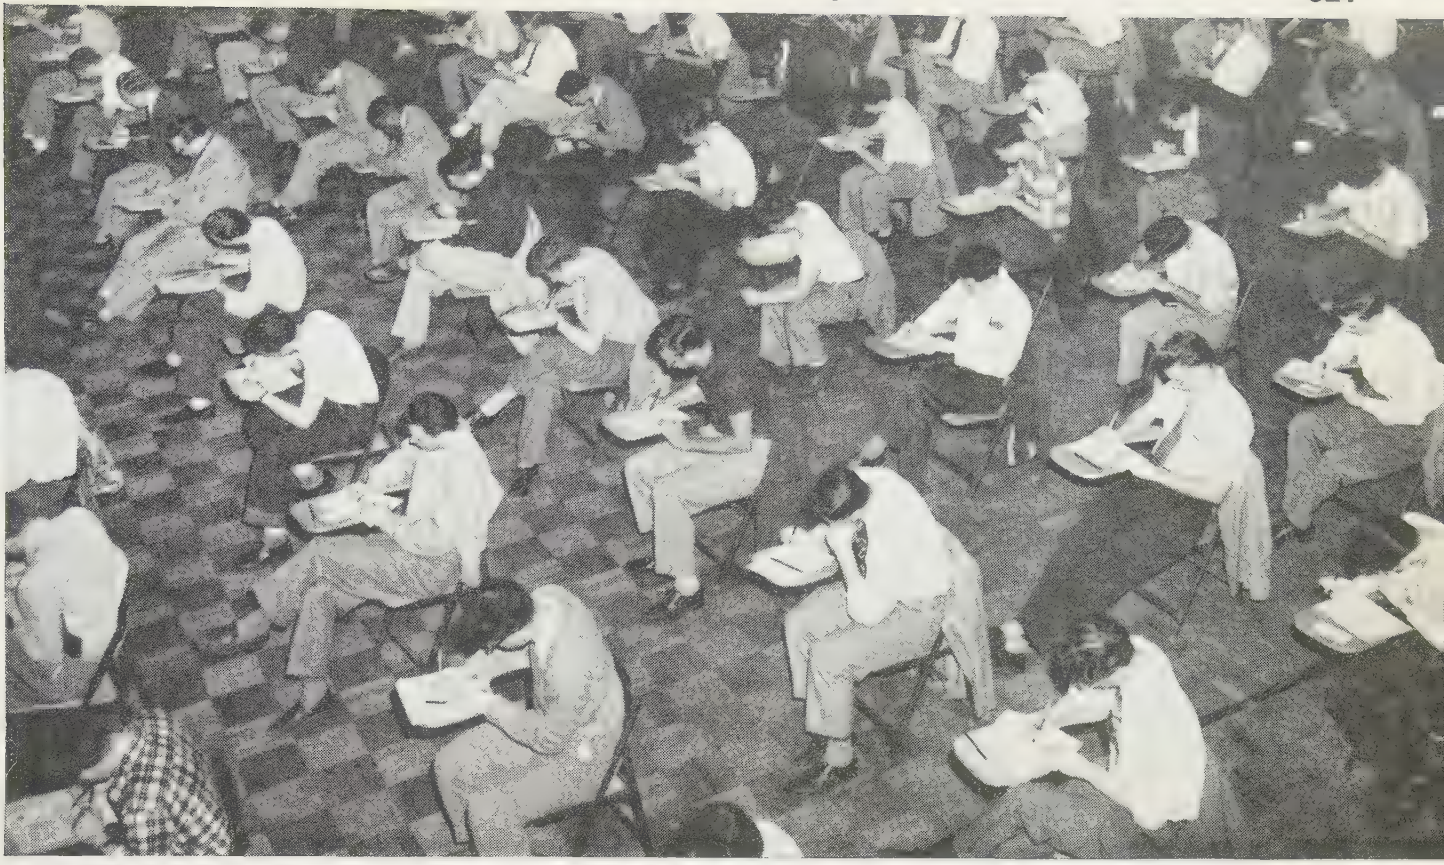
(F. NEU.)

Selective Service, U.S.

Selective Service produced 525,000 men for the armed forces during the calendar year 1951; of these, 42,000 went to the marines.

The Universal Military Training and Service act was approved June 19, 1951. The report of its five-man commission, submitted Oct. 28, proposed six months of compulsory military training for all youths upon reaching 18. Congressional hearings were scheduled to begin early in 1952.

Other drastic changes in the law extended the age of liability from 19 to 26 to 18½ to 26; extended the period of active service for those inducted under the 1948 act as well as the 1951 act to 24 months, with a maximum eight-year obligation for combined active duty and subsequent reserve obligation; established the physical standards as those that prevailed in Jan. 1945, and lowered the mental requirements; provided that registrants who were conscientious objectors and opposed to both combatant and noncombatant military service must perform civilian work contributing to the maintenance of the national health, safety or interest for a period of 24 months; and provided that aliens admitted for permanent residence in the



EXAMINATION PAPERS being filled out in May 1951 under the U.S. selective service ruling that made college students eligible for draft deferment if they scored passing grades

United States were liable for training service. The new act extended authority to extend enlistments involuntarily in the regular and reserve components of the armed forces until July 1, 1953.

The president again was authorized by the act to issue regulations providing for deferment of persons whose occupation, including activity in study, was found to be necessary to the national health, safety or interest; and also for those whose dependents would make it inadvisable to call them to service, except where the wife is the sole dependent, in which case extreme hardship must be shown.

Re-employment rights were extended to enlistees who entered service after June 24, 1948, who served not more than four years, plus any additional period imposed pursuant to law, and to those entering active duty after June 24, 1948, whether or not voluntarily, in response to call and who were relieved within four years or as soon thereafter as they were able to obtain orders.

The definition of veterans was the same as in the 1948 act, and those meeting the requirements were made exempt, married or single. Generally, this requirement was 90 days' service, or more, between Dec. 7, 1941, and Sept. 2, 1945, or a year or more between Sept. 16, 1940, and June 24, 1948. The act also provided for at least one Selective Service appeal board in each federal judicial district within each state, territory and possession.

The act provided that high school students, providing work was satisfactory, were to be deferred until they graduated or until they reached the age of 20, whichever occurred first. This provision was much the same as in the 1948 act. Deferments for college and university students fell in two classes: (1) those provided for by the act and which could be changed only by act of congress; and (2) those provided for by regulations issued by the president under authority of the act and which could be modified or abolished if and when the president considered it advisable.

In considering college students for deferment, three points were emphasized: first, that the standards of deferment were not mandatory for the local boards; second, that the liability for service of a deferred student was not cancelled and that his induction was merely postponed; third, that the test scores and class standing criteria were variables, which might be raised or lowered, either to increase or decrease the number of deferred students. There was nothing compulsory about taking the test.

The deferment criteria were based either upon capacity to learn as demonstrated by the results of nation-wide aptitude tests, or upon performance in the student's study as evidenced by his standing in his class—either, not both.

The first test, conducted by the Educational Testing service, was held in March 1951 at about 1,000 testing centres throughout the country. Four subsequent tests were given during the year. Between 60% and 65% of the students taking the tests received marks of 70 or better. A mark of 70 or better—75 or better for graduate students—was required to qualify a student for consideration for deferment.

Local board reclassification of married men who were not fathers started after passage of the 1951 act. A large number of these men, however, were deferrable for other reasons, such as activity in essential occupation, including agriculture.

Gen. Lewis B. Hershey, director of Selective Service, expressed grave concern over the high rates of rejection for physical and mental reasons. In Jan. 1951 there was a low 28.9% pre-induction rejection rate; in February it dropped further to 27.7%, but then began to climb rapidly and before the end of 1951 was not far from 50%.

On Dec. 21 the director of Selective Service announced that local boards would start in Jan. 1952 to order for re-examination an estimated 300,000 men previously found unacceptable for mental reasons only. The 1951 amendments to the Selective Service law had lowered the minimum mental score from a percentile score of 13 to a percentile score of 10.

General Hershey revealed that of the 1,828,000 men examined by the armed forces between July 1950 and Nov. 1951 approximately 45% were rejected by the armed forces doctors. It was estimated that about 300,000 of these were rejected solely for failure to meet the minimum mental standards.

The accompanying table shows classifications as of Dec. 1, 1951. (*See* also Law.)

Seventh-day Adventists.

The world membership as of Dec. 31, 1950, was 756,712, a gain of 40,174 over 1949. Total funds raised in the churches in the United States and Canada in 1950, for all purposes, were $36,000,000. The membership in the United States and Canada as of Sept. 30, 1951, was 256,845. At the 1951 autumn council, held in Cleveland, O., Oct. 19 to 29, the following important actions were taken: to establish a dental college, which would be located on the campus of the denomination's medical school at Loma Linda, Calif.; to enlarge the Los Angeles division of the medical school at its present location, rather than move to a new one as previously planned, and to expend for such enlargement about $6,000,000; to hold a Bible conference in 1952 to which Bible teachers from the church's colleges throughout the world would be invited; to conduct during 1952 an evangelistic crusade which would be distinguished by the holding of a public meeting in every major city in the United States and Canada, to which would be especially invited all those who listened to the church's national radio and television programs; and to raise the weekly mission offering goal for the North American membership from 70 cents per week to 80 cents, this in addition to tithe. The budget voted at the autumn council for 1952, which did not include the regular operating costs of the church's work in North America, but would be largely sent overseas for mission work, totalled a little more than $17,000,000, the largest annual budget ever voted. Action was also taken to hold the next quadrennial session of the general conference in San Francisco, Calif., in 1954. The international offices at Washington, D.C., were being enlarged in 1951 to double their size at a cost of about $500,000. (*See* also Church Membership.)
(F. D. N.)

Seychelles.

British colony and dependencies, 92 islands (Mahé being the largest) in the Indian ocean. Area: 156 sq.mi. Pop. (1950 est.): 36,000, mainly Negro. Capital, Victoria (pop. *c.* 7,000). Language: English; creole patois. Religion: Christian (*c.* 66% Roman Catholic). Administration: governor; executive council; legislative council.

Governors (1951): J. D. Bates; (from May 14) Frederick Crawford.

History.—High copra prices continued during 1951 and the establishment by the Colonial Development corporation of a fishing base on St. Anne gave another fillip to local development. Three vessels were employed and the export of dried fish to east Africa was started. Elections were held for the legislative council and the restriction of the life of the new council to one year suggested that some measure of constitutional reform was likely.

Education.—Schools (1950): 31 primary (4,756 pupils); 3 secondary; 1 technical training centre.

Finance and Trade.—Currency, Seychelles rupee, valued in 1951 at 21 cents U.S. Budget (1951 est.): revenue Rs. 3,900,000; expenditure Rs. 3,400,000. Foreign trade (1950): imports £441,000; exports £609,000. Production (1950): copra 5,959 tons, cinnamon oil 97,000 kg., cinnamon bark 265 tons, guano 9,847 tons.
(K. G. B.)

Sheep: *see* Livestock.

Shipbuilding.

The world tonnage of merchant vessels of 1,000 gross tons or more, as of June 30, 1951, was distributed as follows among the principal maritime nations:'

Country	Number of vessels	Gross tonnage (in thousands)	Country	Number of vessels	Gross tonnage (in thousands)
United States*	3,477	25,769	Greece	213	1,195
British Commonwealth	3,083	19,054	Finland	183	486
Norway	965	5,293	Brazil	170	616
Sweden	556	1,895	China	146	416
France	534	3,019	Argentina	133	824
Panama	530	3,518	Turkey	111	387
Netherlands	501	2,859	Portugal	91	390
U.S.S.R.	465	1,457	Belgium	80	440
Italy	459	2,646	Honduras	80	415
Japan	411	1,713	Liberia	62	626
Denmark	308	1,200	Yugoslavia	51	217
Spain	268	951	Other Countries	370	1,390
Germany	219	648			
			Total	13,466	77,424

*Excludes vessels operating on the Great Lakes.

The total of 77,424,000 gross tons of vessels in the world fleet was an increase of 2,425,000 gross tons since June 30, 1950. However, the U.S. fleet during the same period decreased by 39 vessels, aggregating 345,000 gross tons. The remainder of the world gained approximately 2,770,000 gross tons of shipping.

The Shipbuilders Council of America reported as of Oct. 1951 that 1,593 vessels (each of 1,000 gross tons or over), aggregating 12,918,149 gross tons, were under construction in the various maritime countries of the world.

The gross tonnage total of 12,918,149 was an increase of 5,731,386 since Oct. 1950. Practically every country showed a proportional increase except Germany, where reported construction rose from 280,793 gross tons to 1,251,668 gross tons in the one-year period, an increase of more than 400%.

This abnormal increase might readily be traced to the decision of the foreign ministers of the U.S., Great Britain and

THE U.S.S. "UNITED STATES," largest and fastest U.S. passenger liner at the time of its christening at Newport News, Va., in June 1951

France in Sept. 1950 to remove all restrictions on size, speed and number of commercial vessels that might be built in Germany for export. This permitted the opening up of German shipyards, with ready facilities to construct almost any type or size of vessel.

United States.—On Jan. 1, 1951, 15 seagoing commercial vessels, each of 1,000 gross tons or more, aggregating 406,070 gross tons, were under construction or under contract for construction in private seaboard shipyards of the United States, as follows: three passenger vessels, three cargo vessels (including two seatrains), three transports, five tankers and one bulk ore carrier.

At the same time there were contracted for or under construction in the Great Lakes shipyards 14 vessels (1,000 gross tons or over), aggregating 153,370 gross tons. These consisted of 2 passenger railway ferries, 1 passenger auto ferry, 11 bulk ore carriers (including 2 self-unloaders).

Ten vessels were delivered in the United States during 1951, as follows: two passenger vessels, one prototype cargo vessel, two seatrains, four tankers and one ore carrier.

Contracts for 77 vessels were awarded during 1951. These contracts were for 35 Mariner type cargo vessels, 36 tankers, and 6 ore carriers. However, work on 14 of the Mariner type cargo vessels was suspended temporarily by the Maritime administration because of a reduction in steel allocations by the Defense Production administration.

As of Dec. 31, 1951, there were 96 merchant vessels (of 1,000 gross tons or over), aggregating 1,251,190 gross tons, under contract for construction in the United States, of which 16, aggregating 176,870 gross tons, were for construction in the shipyards on the Great Lakes, the balance in seaboard shipyards.

Merchant Ships under Construction in the World, Oct. 1951

Country of Building	Number of vessels	Gross tonnage
Great Britain	623	5,502,379
Sweden	170	1,496,173
Germany	210	1,251,668
United States	85	1,082,990
Netherlands	105	928,765
Japan	73	577,325
Norway	79	490,663
France	68	487,462
Denmark	54	315,739
Italy	40	307,250
Belgium	23	158,281
Canada	18	114,150
Spain	30	102,834
Trieste	4	67,000
Australia	10	34,170
Eire	1	1,300
	1,593	12,918,149

During the year 1951, the U.S. navy inaugurated a program of reactivation, modernization, some reconversions and new construction, which covered principally the construction in private yards of one large aircraft carrier, an antisubmarine destroyer escort ship, one nuclear-powered submarine, several landing ships tank, a number of barges, harbour tugs, control boats and other service boats. Contracts for these vessels were awarded to many yards widely distributed throughout the United States.

The volume of repair work in the U.S. yards rose sharply in the early part of the year, with a corresponding increase in employment. After that time, a fairly even rate was maintained. The added volume was occasioned by the withdrawal from the U.S. Maritime administration reserve fleets of approximately 500 vessels for operation under the National Shipping authority, and the rehabilitation of them. (*See* also SHIPPING, MERCHANT MARINE.) (H. G. S.)

Great Britain.—The shipbuilding industry in Great Britain was active throughout 1951, with prices still tending upwards because of rises in wages and the cost of steel. The yards in Great Britain worked to capacity, and the order books of British firms were well filled with contracts. The completion of all these would keep the industry busy for some years, although yards concentrating on smaller craft were not so actively employed as those able to build the largest ships. In Europe, shipbuilding continued to recover from the dislocation caused by World War II and the removal of restrictions influenced building in Germany and Japan. The work in Great Britain continued greatly to exceed that in other countries. The British construction in hand represented, throughout the year, about 40% of the total volume of building in the world.

The construction of oil tankers formed a large part of both work in hand and orders. In the U.K. it amounted to about 55% of the total. As the year proceeded, anxieties about supplies of steel became evident in the United Kingdom and other shipbuilding countries; rearmament threatened to accentuate the shortage of steel in the shipbuilding industry. For this and other reasons shipowners and shipbuilders claimed that the rebuilding of the merchant navies could fairly rank as a form of rearmament, since in the event of war sea transport would again be vitally important.

The total contracts concluded by British builders during the 12 months ended Sept. 1951 totalled 4,000,000 tons gross, which was a record. All the orders entered accounted for 6,250,000 tons gross, of which export work amounted to one-third. Orders were placed during the 12 months for more cargo liners and cargo tramps, as owners expected continued remunerative freight rates in the markets. (CT. M.)

Shipping, Merchant Marine.

There were 1,951 seagoing vessels of 1,000 gross tons and over in the active United States merchant marine on Nov. 1, 1951, including those under military control. Of these, 1,424 were dry cargo vessels, 69 were combination passenger and cargo and 458 were tankers. The total exceeded by more than 550 vessels the number in service at the end of 1950. The number of privately owned vessels had risen during the year from about 1,100 to nearly 1,300; the government-owned fleet had increased from about 300, two-thirds chartered to the military sea transportation service, to more than 650, of which about one-third were in military service.

The vessels laid up in reserve fleets had decreased from about 2,000 to about 1,430.

The reasons for the large increase in the number of vessels in active service were the need for shipping to carry men and military supplies to support the United Nations forces fighting in Korea and the need to transport huge quantities of coal and grain for the relief of the people of Europe and India. While some privately owned vessels were available to meet the most urgent needs of the military services when war broke out in Korea, the continued and increasing requirements of the military and relief programs made it necessary to withdraw large numbers of ships from the reserve fleets.

The reserve fleets were established after World War II by the Merchant Ship Sales act of 1946 for just such emergencies. Surplus vessels of the government's war-built fleet were preserved in these fleets; the best of the vessels were sold to private operators in the United States and abroad, so that they might help to restore war-depleted merchant fleets. At the time the sales provisions of the Merchant Ship Sales act expired on Jan. 15, 1951, a total of 1,956 ships had been sold, 843 to United States operators and 1,113 to foreign operators.

When it became necessary to withdraw more and more vessels from reserve, a new government agency was set up to direct the operation of government-owned vessels in programs required in the national interest. This was the National Shipping authority, established on March 13, 1951, within the Maritime administration of the U.S. department of commerce. Private operators were appointed to serve as general agents in handling the actual operation of the ships. From its establishment to Nov. 15, 1951, the NSA directed the shipment of 6,500,000 tons of coal and grain to Europe and India and the return shipment of strategic ores.

Government and privately owned vessels chartered to the military sea transportation service carried a large share of the 14,000,000 tons of cargoes transported during the first year of fighting in Korea.

Only 9 large merchant vessels were built in United States shipyards from Jan. 1 to Oct. 1, 1951, but the government placed orders early in the year for a total of 35 ships of a new type, the 20-knot "Mariner" cargo ship, although a shortage of steel forced the suspension of contracts on 14 of the ships in the fall of 1951. This vessel was designed to serve as a military auxiliary if necessary, for a serious deficiency in the postwar United States merchant fleet was the lack of cargo vessels fast enough to serve in forward areas in wartime. Most of the 15- to 17-knot Victory ships left in reserve were taken by the military sea transportation service for military service to Korea, and many of the 11-knot Liberty ships were used to carry coal and grain for the Economic Cooperation administration program, but these vessels were no longer considered adequate for modern high-speed warfare.

Another deficiency in the postwar fleet was the lack of large fast passenger vessels suited to both peacetime competitive service and quick conversion to military transports. Late in the year 1950 three passenger-cargo ships being built for round-the-world service were taken over by the department of defense for completion as troop ships. Two other passenger vessels, the "Independence" and "Constitution," were completed in the spring of 1951 and put into operation in the Mediterranean service. The transatlantic superliner S.S. "United States" was floated on June 23, 1951, and was about 85% complete by Dec. 1, with delivery scheduled for the early summer of 1952. Other passenger vessels were under consideration but had not been contracted for. Plans were also under way for high-speed tankers suited to military service.

On Nov. 1, 1951, there were 86 large vessels under construction in United States shipyards, of which 76 were for United States flag operation. Of the latter, 39 were for government account and 18 were for Great Lakes operation.

(E. L. Co.)

Other Countries.—All the main sections of shipping continued to be influenced throughout 1951 by the fighting in Korea and by rearmament among the United Nations and arrangements for the stock-piling of essential foodstuffs and materials. British shipping was particularly affected by the need to import coal and timber on a large scale, and the requirements of India for imported grain, of which about 2,000,000 tons were sent, was one of the chief factors in a persistent, well-spread demand for tramp tonnage.

More than 1,000,000 tons of coal were imported to the United Kingdom from the United States, which meant more than 100 voyages of large cargo ships, whereas in the past the U.K. had been a large exporter of coal. Its inability to meet the needs of European countries for coal, as it had done in the past, implied that these countries also had to import coal, and they looked, mainly, to the U.S. for supplies. Late in the year, it was announced that the National Coal board had obtained further limited supplies of coal in the U.S.

At the same time large quantities of timber were bought on the Pacific coast of North America for export to the United Kingdom. In order to provide transport, ships were taken on time charter at various ports throughout the world and were directed in ballast to the Pacific coast, there to load timber and other commodities.

Many trades were in urgent need of tonnage. The transport of ore from Mediterranean ports to the United Kingdom and the United States, for example, absorbed much shipping. Under keen competition, freight rates advanced sharply. Shippers seemed to be concerned only to secure tonnage irrespective of the cost.

Another demand for cargo tonnage resulted from the expansion of British exports. These far exceeded the carrying capacity of the regular liners, and the liner companies chartered additional cargo ships to supplement their own sailings. This chartering was particularly heavy in the export trade from the U.K. to Australia. Many ordinary cargo ships were also chartered for voyages to New Zealand and for round voyages to west Africa.

The prolonged interruption of work in New Zealand ports, resulting from labour trouble, immobilized a large volume of specialized, refrigerated liner shipping from the middle of February until mid-June. At one time more than 50 oversea liners, representing 500,000 tons gross, were lying idle in New Zealand ports or were being worked by ships' officers or by members of the armed forces. Slower work in many other ports, especially in Australia, seriously reduced carrying capacity because, over a given period, fewer round voyages could be made. This created a demand for more shipping and was one of the factors that caused the demand to exceed the supply.

There was further evidence that the demand for travel which had to be postponed during World War II had been largely satisfied, and that traffic by sea was again assuming some of the seasonal character which was apparent before the war.

There were a number of important additions to the liner fleets. Among the first of these to appear was the turbine steamship "Ocean Monarch" of 14,000 tons gross, which was built to undertake cruises from New York to the West Indies and Canadian rivers and to share at times in the Furness line's service between New York and Bermuda. The ship left the U.K. to begin sailings in May. The cost of the vessel was estimated at £2,500,000.

On May 15, the Orient liner "Oronsay," of 28,000 tons gross, left London on her maiden voyage to Australia; the ship cost £4,000,000. A contract for a similar ship had been placed with the builders, Vickers-Armstrong, of Barrow-in-Furness. Two months later, the British India Steam Navigation company's passenger and cargo liner "Kenya," of about 15,000 tons, entered the Thames preparatory to making her maiden voyage. The cost of the vessel was about £2,000,000. A sister ship, the "Uganda," was also under construction.

The Union-Castle liner "Rhodesia Castle," of 17,000 tons gross, built for the Union-Castle's round Africa service also entered the Thames, where she loaded cargo for her maiden voyage. The cost of the ship was about £2,000,000.

In November rising costs were reflected in increases in the fares of the British shipping companies serving India, Australia and New Zealand. The minimum first-class fare from London to Sydney was raised from £110 to £120 and the corresponding first-class rate from London to New Zealand was increased from £131 5*s.* to £140.

The interruption of oil supplies from the large refinery at Abadan, Iran, involved the diversion of a certain amount of tanker tonnage to other routes and longer voyages. This diversion would have been greater had there not been a large increase in the output of crude oil from Kuwait in the Persian gulf.

Rates gradually advanced and in November amounted to more than 300% above the scales of the ministry of transport at the end of World War II. A large amount of tonnage was being built by the independent owners of tankers, much of which was chartered for several years ahead.

FILMS OF 1951.—*The Sea, My Native Land* (United Nations, Film Division). (CT. M.)

Shoe Industry. Shortages in the U.S. shoe industry were freely predicted early in 1951 and the public responded with multiple purchases of shoes. However, these shortages did not actually materialize and with the second quarter of 1951, consumers slowed their buying activity. This started a chain reaction. Many retailers, in anticipation of continuing good business, had overextended their purchases and were soon concerned with extensive inventories and how to reduce them. Their orders for future commitments were trimmed, as to the number of pairs and for shorter delivery dates.

Manufacturers, in turn, had expected that consumer demand and military orders would keep them at full capacity of production; but orders for military shoes did not amount to more than 20,000,000 pairs and civilian demands tapered off. Shoe manufacturers, therefore, were obliged to curtail production with the result that total production figures for the year represented a decrease of about 30,000,000 pairs from the 1950 totals—a post-World War II low. The decline was not limited to any one category and was reflected in men's, women's and children's lines. The output of casual shoes, however, increased by approximately 3,000,000 pairs.

Manufacturers and retailers introduced some new styles and types in 1951. The tapered toe in women's shoes occasioned new interest and acceptance and there was a revival of interest in the Louis or French heel (covered wooden heel which pitches well forward under the foot with a gracefully curved outline). Women became increasingly aware of foot comfort and were offered attractive shoes that combined style and comfort—for example, the soft toe, flexible types, medium platforms—one-fourth to one-half inch—and medium or midway heels. In men's shoes, the laceless slip-on, the rubber-soled (synthetic) fabric-upper oxford and nylon mesh were important developments.

Leather.—There was a wide range in U.S. hide and skin prices in 1951. Starting with peaks in early January and followed by governmental regulations and price freezes, there were spurts of activity at full ceiling prices until August, when poor leather business brought a halt to demand at ceiling prices. A period of decline set in which reached its low point at the end of November, when peak packer prices had declined considerably from their ceilings. Reaction upward set in at the end of the year, when hides and skins were stabilized under ceiling prices and prospects for tanners seemed brighter for 1952.

Producers of substitutes and synthetics promoted their products extensively, stressing durability, attractiveness and price; and they became a considerable competitive challenge to tanners of leather.

Foreign manufacturers continued to look to the United States as a necessary outlet for their shoes. They concentrated their energies and creative abilities on designing shoes that would appeal to Americans and sent groups and missions to the United States to learn more about the U.S. methods of production. More and more were making shoes over American lasts and were improving the fitting qualities of their shoes through a wider range of sizes and widths. (*See* also LEATHER.)

Shooting. A field of about 2,000 marksmen took part in the 52nd Grand American tournament, blue-ribbon event of trapshooting, at Vandalia, O., Aug. 17–25, 1951. E. Michael Wayland, 18-year-old student from Washington, Kan., became the first from his state to win the Grand American handicap when he broke 99 out of 100 in the first round. Mrs. Ruth Winterrowd, Chicago, Ill., scored 94 out of 100 for the women's trophy; Ronald Mosier, Fresno, Calif., shot 96 out of 100 for junior laurels; and Cliff Doughman, Morrow, O., topped the professionals with 91 out of 100.

Arnold Reigger, Seattle, Wash., stole the show on the closing day by capturing the over-all and all-around championships. Reigger shattered 388 out of 400 in the all-around which included 200 targets at 16 yd., 100 at handicap and 100 doubles. Art Finney of Mankato, Minn., was runner-up. Reigger scored 966 out of 1,000 in the 16-yd., doubles and handicap tests for the over-all title. Joe Hiestand, Hillsboro, O., was second with 965.

North American Clay Target championship honours went to Ralph Smith of Vandalia; Corrine Farrell, Yakima, Wash., took the women's crown and Rudy Etchen, Seattle, Wash., led the professionals. Ned Lilly, Stanton, Mich., and Mrs. William Isetts, Kenosha, Wis., were other major victors at Vandalia, leading their respective groups for champion of champions' honours.

Howard Lewis, Uhlerstown, Pa., won the distance title in the U.S. amateur meet at Travers Island, Pelham Manor, N.Y., May 11–13. Elbert Johnson, Wingdale, N.Y., broke 25 straight in a shootoff for the 200-target crown. Other winners included R. A. Baldwin, Danbury, Conn., junior; E. E. Gardner, Bernardsville, N.J., senior; Mrs. Van N. Marker, Evanston, Ill., women's; Col. J. B. Grier, Rockland, Del., doubles.

Sgt. G. W. Van Buren of Carswell air force base at Fort Worth, Tex., annexed the all-gauge laurels for the third time in four years in the National Skeet association championships at Dallas, Tex. Recording a perfect score of 250 out of 250 in the three-day competition, Van Buren, who also won the service title for the third time, led a field of 399. Francis L. Ellis, Jacksonville, Fla., won the high over-all and subsmall-gauge honours while Mrs. R. H. Hecker, Tucson, Ariz., starred among the women, taking the over-all, all-gauge and subsmall-gauge tests. Other skeet champions included the following: Grant Ilseng, Houston, Tex., champion of champions; Tony Roth, Northwestern university, Evanston, Ill., intercollegiate; J. V. Eliot, Jr., Pasadena, Calif., industry all-gauge; D. Lee Braun, San Mateo, Calif., industry over-all and industry subsmall-gauge.

National rifle title winners were: Mason Kline, San Francisco, small-bore; Second Lieut. Remes De La Hunt, Camp Lejeune, N.C., high-power (service rifle M1); Thomas R. Barnes, Billings, Mont., match rifle; Elinor Bell, Santa Monica, Calif., women's small-bore; Helen Orme-Johnson, El Paso, Tex., women's match rifle.

Sgt. Huelet Benner of Fort Knox, Ky., took the national pistol championship for the third time with 2,629 out of 2,700 at San Francisco. The women's crown was annexed by Gloria Norton, Woodland, Calif. Mark Walsh, New York city, won the William Randolph Hearst trophy in the international police pistol championships at Teaneck, N.J., with 294 out of 300. The Joseph W. Girard trophy, for the high individual scorer, was taken by William Crawford, White House guard, who tallied 299 out of 300. Mrs. Florence Hendricks, Franklin Lakes, N.J., scored 293 out of 300 for women's laurels in the tournament that attracted marksmen from the United States, Canada, Mexico and Cuba. (T. V. H.)

Shows.

This article covers horse and dog shows, livestock exhibitions and such travelling shows as circuses, carnivals, ice skating shows and rodeos. For musical, dramatic, and terpsichorean events of 1951, *see* the articles MUSIC, THEATRE and DANCE. (*See* also MOTION PICTURES.)

Horse Shows.—Among the hundreds of horse shows held annually throughout the United States, the largest and most representative one in all divisions was the 1951 International Horse show, held from Nov. 24 to Dec. 1 in Chicago, Ill., in connection with the International Live Stock exposition. The International Horse show is one of the longest established horse shows in the country and is particularly outstanding in the entry it draws of saddle horses, harness horses, roadsters and hunters. It also includes representatives of the draft breeds. Of near matching rank is the American Royal Horse show in Kansas City, Mo., held in 1951 from Oct. 13 to 20.

The year's two largest shows of quarter horses were at the National Western Stock show in Denver, Colo., Jan. 12–20, 1951, and the Southwestern Exposition and Fat Stock show in Fort Worth, Tex., Jan. 26 to Feb. 4. The Fort Worth show was outstanding for its cutting horses—competitions that feature horses trained in the quick manoeuvres required for range work.

The Grand National Livestock exposition in San Francisco, Calif., Oct. 26 to Nov. 4, was the year's outstanding show of stock horses that are trained in response to rein signals.

Another show of national import was the five-gaited saddle horse show at the Kentucky state fair, Sept. 7 to 13. The Kentucky show ranks at the top as a competition of American saddle horses. Another Kentucky showing of saddle horses, of major rank, was held at Lexington in mid-July.

The year's top show of hunters was at the National Horse show, held Oct. 30 to Nov. 6, 1951, in Madison Square Garden in New York city.

Other leading horse shows in the general class were the Harrisburg, Pa., show and those held in conjunction with the Illinois, Indiana, Minnesota, Missouri, Ohio and Wisconsin state fairs.

Livestock Shows.—The National Western Stock show in Denver, held in 1951 from Jan. 12 to 20, traditionally starts the livestock show year in the United States. It ranks as the top annual livestock event of the mountain states. It was the largest show of purebred Hereford cattle held in the United States during 1951. The show is an important supplier of Whiteface bulls for range service. The 1951 Denver show also featured large classes of quarter horses and Palominos, both popular types in ranch work.

The oldest established livestock show in the United States is the Southwestern Exposition and Fat Stock show, which took place in Fort Worth, Tex., Jan. 26 to Feb. 4, 1951. The Fort Worth show was distinguished principally for its excellent exhibits of Herefords and, to a lesser extent, the other two beef breeds—Aberdeen-Angus and Shorthorns. It also featured large exhibitions of purebred Brahman cattle, a breed that had had great influence in recent years in improving beef production of the south when crossed upon beef breeds of British origin. Immediately following the Fort Worth show was another Texas show, known as the Houston Fat Stock show.

The earliest state fair to be held in 1951 was the North Dakota state fair, which was held in Minot July 30 to Aug. 4. The state fairs continued in consecutive weeks through the late summer and early fall. Many exhibitions of cattle, horses, sheep and swine were seen at these shows, the largest of which were the Illinois, Indiana, Ohio, Iowa, Minnesota and Wisconsin state fairs. The National Hereford Cattle show was held in conjunction with the Texas state fair, held in Dallas Oct. 6 to 21, 1951. The Wisconsin state fair was held in Milwaukee, Aug. 18 to 26. In recent years it had been the country's largest showing of the dairy breeds.

Two shows of national rank exclusively devoted to the dairy breeds were held in Iowa and Indiana: the long-established National Dairy Cattle congress in Waterloo, Ia., Sept. 29 to Oct. 6, 1951 and the International Dairy exposition which took place at Indianapolis immediately following.

The first of the sectional livestock exhibitions during 1951, which attract top herds and flocks from states within their areas, was the Eastern States exposition, held in Springfield, Mass., Sept. 16 to 22; emphasis was on the dairy breeds from the eastern states. Another in this class was the Ak-Sar-Ben

Live Stock and Horse show in Omaha, Neb., Sept. 28 to Oct. 6, held in conjunction with the National Shorthorn Cattle show.

The leading show of the northwest was the Pacific International Livestock exposition in Portland, Ore., Oct. 5 to 13 and, shortly after, the Grand National Live Stock exposition in the new Cow Palace in San Francisco, Oct. 26 to Nov. 4.

A new eastern show, particularly strong in its exhibits of Aberdeen-Angus and Hereford cattle, was the Eastern National Livestock show, held in Timonium, Md., Nov. 10 to 15.

The American Royal Livestock show in Kansas City, Mo., held in 1951 from Oct. 13 to 20, is a long-established mid-continent fixture. Its horse show ranks among the country's best.

In its perennial position at the close of the livestock show year was the 52nd annual International Live Stock exposition, held Nov. 24 to Dec. 1 in the International amphitheatre at the Union Stock Yards, Chicago. With exhibits from 36 states and 5 Canadian provinces, it again ranked as the country's leading livestock and farm crops show. Its entry comprised 11,967 head of livestock, representing 26 different breeds of meat animals and draft and pleasure horses.

Chicago was also the locale of the country's largest feeder cattle show of 1951, when the seventh annual Chicago Feeder Cattle show and sale was held in the pens of the Chicago stockyards, Oct. 25 and 26, 1951. The exhibitors were western producers and, following the judging of the carlot units, corn-belt feeders were the purchasers in an auction of all the offerings. New record prices for cattle of this class were paid in a sale setting an all-time high of $1,050,633.26.

The Calgary Exhibition and Stampede was the principal event in Canada in the early summer, held July 9 to 14, 1951. The largest Canadian summer show was the Canadian National exhibition in Toronto, Ont., Aug. 24 to Sept. 8. The principal livestock event each year in Canada is the Royal Agricultural Winter fair, which in 1951 took place in Toronto, Nov. 13 to 21.

South America's foremost livestock show is the Palermo, held in Buenos Aires, Arg., in August. It is famed as the world's largest showing of purebred Shorthorn cattle.

Scotland's oldest show—that of the Highland and Agricultural society—marked its 112th annual renewal in June, and the British Royal show in early July commemorated its 103rd anniversary under the sponsorship of the English Royal Agricultural society. (W. E. O.)

Dog Shows.—Competition both in the show ring for conformation and in the field for hunting excellence was active in 1951. There were 624 championship dog shows held, of which 367 were for all breeds and 257 were for one breed each.

Again the largest dog show in the U.S., a one-day outdoor show, was that of the Morris and Essex Kennel club at Madison, N.J., May 26, with 2,224 dogs present and competing. Top honours at this event were won by the English setter male Champion Rock Falls Colonel owned by W. T. Holt.

The field trial group had approximately 820 events in the various classifications—8 greyhound trials on live rabbits, 165 foxhound and coonhound trials; 29 spaniel trials; 220 beagle trials—on rabbits; 54 retriever trials—both land and water work; 285 bird dog trials for setters and pointers; 2 basset hound trials; 1 dachshund trial; 18 Brittany spaniel trials (pointing trials on feathered game); and 38 miscellaneous trials. All these trials simulated actual hunting conditions so far as possible.

There are almost a dozen major bird dog trials but the winner at the Grand Junction, Tenn., trial is considered the national champion; in 1951 it was the liver and white male pointer Paladin, owned by A. G. C. Sage. The pointer had predominated over the setter in bird dog trials for 20 years.

The national field trial champion in springer spaniels was Flier's Ginger of Shady Glen owned by Mahlon Kline, the trial being run near Herrin, Ill., in December.

The national retriever field trial champion was chosen at the Carnation, Wash., trial Nov. 29, and was Mahlon Wallace's golden retriever Ready Always of Marianhill.

Formal dog training again received prominent attention, 264 formal obedience trials being held.

In registrations in the various stud books, approximately 290,000 dogs were included. The leading registry agency, the American Kennel club, registered a total of 264,415 dogs in 107 breeds. The first ten in order were as follows: (1) cocker spaniel 52,644; (2) beagle 36,075; (3) boxer 27,271; (4) collie 20,450; (5) dachshund 15,181; (6) Boston terrier 11,914; (7) Chihuahua 10,810; (8) German shepherd dog 8,585; (9) Pekingese 8,227; (10) Pomeranian 5,992. (W. Ju.)

Circuses, Carnivals, Rodeos and Other Travelling Shows.—With few exceptions, outdoor showmen found the going rough in 1951. In Europe, where numerous restrictions had hampered travelling shows after World War II, conditions were slightly improved, but in the U.S. and Canada shows not only encountered more than the usual amount of unfavourable weather in the first half of the season, but also were confronted with increased railroad rates, more stringent licensing regulations and a manpower shortage resulting from more favourable wages and working conditions being offered in other lines of work. In the U.S. the number of circuses on rails dropped from four to two in 1951. Both of the rail shows reported a profitable season. Truck circuses increased in number but most of them, insufficiently financed and not too well managed, made little profit. In all there were about 45 American circuses on the road in 1951. Indoor circuses, whose main season is the winter months, continued to prosper. The three large operators, Orrin Davenport, Hamid-Morton and Polack Bros., reported business equal to that of 1950. Many small truck shows, playing under canvas, encountered difficulties with local chambers of commerce and better business bureaus because of unscrupulous telephone ticket campaigns, which resulted in passage of ordinances restricting telephone solicitation.

In England and continental Europe circuses fared better in 1951 than in the previous year, and there was an increase in number of shows. The Bertram Mills show and Tom Arnold's Harringay circus were England's leading shows. About 40 or more other circuses, mostly small truck outfits, toured England and the continent. Leading continental circuses were Circ Medrano, Paris, Fr., and the Circus Knie, Switzerland. Other shows touring all of the European countries outside the "iron curtain" territory were Circus Schumann, Circus Belli, Circus Miehe, Circus Bruun, Circus Louis Schmidt and Circus Moreno. Trolle Rhodin's Zoo circus played Iceland. Circuses of varying sizes also operated in Egypt, China, Australia, South Africa, the Hawaiian Islands and the Latin-American countries. Santos and Artigas toured Cuba; Circo Nelson operated in Venezuela and the West Indies; Circo Royal in Puerto Rico; Boswell Bros. circus in South Africa; E. K. Fernandez in Hawaii; Circo Buffalo Bill and Grand Circo Americano in South America.

There was little change in number, size and operation of carnivals in Canada. The first half of the season, when "still dates" (no auspices) are played, was disastrous for most shows because of inclement weather. The last half, played mainly at fairs, enabled many shows to recoup part or all of their early season losses. Three shows operating on rails, Royal American in the midwest and James E. Strates and World of Mirth in the east, reported exceptionally good business.

Western rodeos had a fair season in 1951, drawing excellent attendance when weather was favourable. The leaders, as usual, were those at Calgary, Alta., Cheyenne, Wyo., Salinas, Calif., and Sidney, Neb. In the eastern half of the country the smaller rodeos had only moderate appeal. The Madison Square Garden event, in New York city, with the Lone Ranger and Tonto as features, fell considerably short of its attendance record of 1950. A championship rodeo held at the International amphitheatre in Chicago, with Harpo Marx featured, drew small attendance and operated at a substantial loss.

Ice skating shows, which mushroomed during the decade 1940–50, found the going rough in 1951. Few of the newer shows made a profit. The *Sonja Henie Ice Show,* long a leader, had a marked falling off in attendance. Disagreements between the owners, Arthur R. Wirtz of the Chicago stadium and Sonja Henie, resulted in dissolution of their partnership and a decision of Miss Henie to operate the show herself, while Wirtz organized a new show. The huge roller skating spectacle, *Skating Vanities,* operated for a number of years with little profit, had a spotty season. Automobile thrill shows, in which autos were crashed, rolled over and catapulted over ramps, continued popular but were hampered by inclement weather.

Although the heyday of the stock and repertoire shows had passed many years before, there were scores of repertoire and novelty shows still touring the smaller towns, with varying success. Many of them were two- and three-people shows playing under auspices of local clubs, church and social groups and offering drama, comedy, puppet shows, magic and illustrated lectures. Brunk's Comedians, one of the oldest of the travelling tent shows, continued to do good business in the southwest. Minstrel shows were popular in the south, where the Silas Green show, the Rabbit Foot Minstrels and the Georgia Minstrels had operated for many years. The Sun Players, operating in Iowa, was one of the few remaining stock companies, playing what is known as "circle stock," a circuit of six or more Iowa towns which were played consecutively. J. W. Menke, who had toured Mississippi and Ohio river ports for 20 years, continued to operate his Goldenrod Showboat on the Mississippi river during the 1951 season. Grimaldi Family Players in New England, Gale Players in the state of Washington and Florian Players in Indiana were others which continued operation in 1951. (NA. G.)

Sikkim.

An Indian-protected state, Sikkim is bounded north by Tibet, east by Bhutan, south by India and west by Nepal. Area: 2,745 sq.mi. Pop. (1941 census): 121,520, mostly Nepalese, also Bhotias of Tibetan extraction (10,980) and Lepchas or Rongpa (13,060) of Indochinese origin. The state religion is lamaistic Buddhism but most Nepalese are Hindu. Capital: Gangtok. Maharaja (from 1914): Tashi Namgyal, of the Tibetan ruling family.

History.—To ease the strain on his father, the maharaj kumar (crown prince) Pallen Thondup Namgyal, undertook the ordinary state business including the arrangements necessitated by the new protectorate treaty with India which was signed on Dec. 5, 1950. His assurance that Sikkim would remain within India regardless of events in Tibet recognized India's responsibility for Sikkim's defense. (On May 30, 1951, the Moscow *Pravda* remarked that the two Himalayan states, Bhutan and Sikkim, were "unlawfully" seized by the British from Tibet.)

India lent to Sikkim an experienced political officer, J. S. Lall, who was appointed dewan (chief minister) with an advisory council. For local administration more than 50 elected panchayats (village councils) were set up. Pending the creation of an elected council to form the state parliament, on India's advice, a cabinet, composed of six members chosen by the Sikkim Congress party, six by the National and Kishan Proja party and five nominated by the maharaja, was formed and took office in November, J. S. Lall remaining as adviser. Out of the five nominated members, one was a plainsman, one a Sikkim lama, two were Tibetans and one a Nepali. As the revenue (Rs. 600,000 plus the subsidy of Rs. 300,000 from India) was insufficient to develop Sikkim's mineral resources, India announced its intention to consider giving help. Copper, graphite, soapstone and iron were the chief minerals concerned. The copper mines were abandoned during World War II. (E. HD.)

Silk.

Despite an optimistic condition at the beginning of 1951, the silk industry did not maintain the rate of recovery which it had shown in 1950. In the United States, consumption of raw silk dropped by one-third, and less than half as much fibre was imported. Japanese exports to other countries showed a similar decrease. On the basis of ten months' reports, Japan's four best silk customers, the United States, United Kingdom, France and Switzerland, took only 60% of the total exports, compared with 80% in 1950. The estimate for the year was a total export of 67,800 bales, compared with 94,621 bales in 1950.

At the third International Silk congress at London in September it was proposed by the important consuming nations that the Japanese stabilize the price of raw silk. In the United States, the price of raw silk in Jan. 1951 was $5.18 per pound, and in December was $4.70. The low for the year was $4.05 in August, and the high was $5.96 in February. The Japanese were agreeable to stabilization but did not accept the buyers' proposal that the stabilized price be at $3.80, with a tolerance of 10% either way. Instead, they proposed a price of $4.50. An enabling law to put a stabilization plan into effect was passed after lengthy discussion on Nov. 13, 1951, by the Japanese diet with the expectation that it would be operative by Feb. 1952 at a price of about $4.45 per pound, and to continue until May, 1952.

Production of silk fabrics in the United States reflected the decreased raw silk consumption. From 1950's record of 29,300,000 yd., the mills reduced their output to 27,200,000 yd. Imports of silk fabrics totalled 32,000,000 yd., compared with 41,700,000 yd. in 1950.

Promotion and publicity to increase the use of silk was accelerated with the announcement that a fund of $600,000 would be available during a two-year period, among the principal consuming nations of the world. Of this sum, $225,000 would be spent in the United States, United Kingdom, France and Switzerland during the fiscal year July 1951–July 1952, and $75,000 among other countries. In addition, each country would set up its own publicity committee for administration of its separate campaign, but it was understood that all publicity and promotion would be cleared through the international secretariat in Lyons, Fr. In the United States, the local committee under the name of International Silk association (U.S.A.) Inc., announced in December that its plans were being formulated, and appointed an advertising agency for their administration. (*See* also RAYON AND OTHER SYNTHETIC FIBRES; TEXTILE INDUSTRY.)

(I. L. BL.)

Silver.

World silver production took a sharp upward turn in 1950, to the highest level since 1943.

United States.—Domestic production had been gradually improving since 1946, but had reached only 60% of the 1941 record of 71,075,932 oz.

During the first half of 1951, the mine production rate remained at the 1950 level, but a decline in the third quarter cut the total for the nine months to 29,776,128 oz., 6% below the average rate for 1950. The reduction was in the by-product silver from base metal mines closed by strikes.

Skiing.

Ernie McCulloch, Canadian star competing in the colours of the Sun Valley Ski club, swept to downhill honours in the North American championships held at Aspen, Col., in Feb. 1951. Negotiating a course made slow by fresh snow in 2 min. 53.5 sec., McCulloch triumphed by little more than one-tenth of a second. The runner-up was Guttorm Berge of Norway, a student at Whitman college, Walla Walla, Wash., who carried off the combined laurels by virtue of a victory in the slalom and his second place in the downhill contest.

Michael Anne Healey of Aspen gained her first major title in the women's downhill event in which Imogene Opton and Salley Neidlinger of Sun Valley, Ida., placed second and third, respectively. Miss Neidlinger carried home the slalom prize and Miss Opton, with another second to her credit, led in the combined scoring.

The North American title jump at Ishpeming, Mich., was won by the Swedish national champion, Evert Carlsson, with Art Devlin of Lake Placid, N.Y., defending champion, second. Carlsson led the field with leaps of 238 ft. and 230 ft. for 210.1 points. Devlin soared 223 ft. and 219 ft. for 205.9 tallies. Arthur Tokle of Brooklyn, N.Y., jumped 231 ft. and 220 ft. to place third.

United States championships were conducted in different sections, the jumping competition at Brattleboro, Vt., in mid-February drawing the most colourful field. Arthur Tokle annexed the class A title after twice breaking the record of 230 ft. set by his brother Torger in 1942. Tokle made leaps of 239 ft. and 237 ft. and scored 239.1 points. M. Barber of Brattleboro was runner-up with 237.1 tallies and Devlin was third with 233. Keith Zuehlke of Eau Claire, Wis., was the class B leader.

Sun Valley stars dominated the national downhill events at Whitefish, Mont., in March. McCulloch added to his North American prizes by annexing the downhill event over an icy course in 2 min. 07.4 sec. Katy Rodolph was first in the women's race in 1 min. 37.4 sec. for her third United States title of the campaign, as the Sun Valley miss also took the slalom and combined honours. Suzy Harris Rytting of the Alta (Utah) S.C. won the women's giant slalom.

McCulloch retained his U.S. giant slalom honours while Ted Farwell of Montague, Mass., triumphed for both the cross-country and combined titles. Jack Nagel of Sun Valley scored in the closed downhill test and the open-closed slalom to gain the combined open-closed championship.

Jack Reddish of Salt Lake City, Utah., and George Macomber of West Newton, Mass., headed the squad chosen at Sun Valley on March 19 for the 1952 winter olympic games in Norway. Andrea Mead Lawrence of Hanover, N.H., Jeannette Burr of Seattle, Wash., and Miss Opton and Miss Neidlinger were among the feminine stars chosen to represent the United States.

Smith, Margaret Chase

(1897–), U.S. senator, was born on Dec. 14 at Skowhegan, Me. Graduated from the Skowhegan high school in 1916, she taught school in 1916–17 and later worked for a country newspaper. From 1928 to 1930 she was treasurer of a waste process company in Skowhegan and was connected with a textile company. After her marriage in 1930 to a former state senator, Clyde H. Smith, she became active in politics and was a member of the Republican state committee from 1930 to 1936. Her husband was elected to the U.S. house of representatives in 1936, and upon his death she was elected June 3, 1940, to fill his unexpired term. She was re-elected consecutively to the 77th-80th congresses (1941–49). In 1948 she was elected U.S. senator from Maine for the term 1949–55—the only woman member of the senate.

In the house and senate, Mrs. Smith maintained a prolabour record; she also consistently supported the administration's foreign policy and opposed Republican attacks on Secretary of State Dean Acheson. On June 1, 1950, she led six other "liberal Republican" senators in censuring Sen. Joseph R. McCarthy (*q.v.*) for his tactics in exposing alleged Communist sympathizers in the state department and other branches of the government. McCarthy, as senior Republican on the senate committee on expenditures in the executive departments, removed her from the committee's investigating subcommittee on Jan. 26, 1951, and transferred her to a subcommittee on government reorganization.

Smithsonian Institution.

This institution. located on the Mall in Washington, D.C., was established in 1846 through a bequest from James Smithson, an English scientist. Its purpose is "the increase and diffusion of knowledge among men"; this is carried out by means of scientific researches and explorations, publications and museum and art-gallery exhibits. The institution is governed by a board of regents, composed of the vice-president of the United States, the chief justice of the United States, three senators, three representatives and six citizens from various parts of the country. The executive officer is the secretary, who in 1951 was Alexander Wetmore. The institution has ten branches: United States National museum, National Gallery of Art, National Collection of Fine Arts, Freer Gallery of Art, Bureau of American Ethnology, International Exchange service, National Zoological park, Astrophysical observatory, National Air museum and Canal Zone biological area.

During 1951 the institution continued its scientific investigations, chiefly in the fields of anthropology, biology, geology and astrophysics. Several expeditions took to the field in the interests of these researches, resulting in much new information and in large collections of valuable specimens.

The National museum collections were increased by more than 303,000 objects, bringing the catalogue entries to a grand total of 32,617,298. Only a small fraction of these could be exhibited; the rest for the most part belonged to the study collections assigned to the museum's six departments: anthropology, zoology, botany, geology, arts and engineering and history. Field expeditions took National museum staff members to distant parts of the world—Cuba, Panamá, Costa Rica, Honduras, Colombia, South Africa and Southern Rhodesia, British North Borneo, Okinawa, Alaska and many sections of the United States.

The National Gallery of Art received 4,044 accessions, nearly 1,700 more than the previous year. It held eight special exhibitions during the year. On March 17, 1951, the gallery celebrated its tenth anniversary at a special exhibition of paintings and other works of art acquired since 1945 by the Samuel H. Kress foundation; more than 24,000 guests attended. Accessions to the National Collection of Fine Arts included 15 paintings pertaining to the Adams family (part of the Adams-Clement gift to the Smithsonian) and a collection of paintings and a sustaining fund in memory of Alice Pike Barney. A Centennial Exhibition of Paintings by Thomas W. Dewing was held during the year, and the Albert Pinkham Ryder room was opened, exhibiting together the 17 Ryders in the National Collection. The Freer Gallery of Art acquired choice specimens of Chinese paintings, pottery and bronzes; Japanese paintings; and Persian metalwork.

The Bureau of American Ethnology continued archaeological work in Panamá and the Canadian arctic and carried on ethnologic studies in Mexico and the western United States. The River Basin surveys, a unit of the bureau, continued its archaeological work at sites threatened by construction of dams and reservoirs in connection with river-basin projects in various parts of the country. The year's excavation work covered 20 reservoir areas in ten states, with 26 excavating parties in the field. Another unit of the bureau, the Institute of Social Anthropology, conducted co-operative field work and teaching programs in Brazil, Colombia, Guatemala, Mexico and Peru.

The Astrophysical observatory continued its studies of solar radiation at its two high-altitude stations on Mt. Montezuma, Chile, and Table mountain, California. The observatory's division of radiation and organisms began a series of biochemical investigations of photomorphogenesis in green plants.

The National Air museum received and placed on exhibition the Bell X-1, the world's first supersonic, man-carrying aeroplane, and a duplicate example of the world's first successful supersonic ramjet engine and its rocket booster.

The International Exchange service handled 1,011,000 packages (weighing 826,000 lb.) of scientific and governmental publications, serving as the United States agency for the interchange of such material with other countries.

A new laboratory building was under construction at the Canal Zone biological area on Barro Colorado Island, Pan. Thirty-three scientists used the island's facilities during the year, carrying on studies in various branches of biology.

The institution issued 61 publications during the year, especially noteworthy among them being part 11 of Ridgway and Friedmann's *Birds of North and Middle America;* volume 6 of the *Handbook of South American Indians;* another volume of Clark's *Monograph of the Existing Crinoids;* Drucker's *The Northern and Central Nootkan Tribes;* and two monographs of the Institute of Social Anthropology. The Smithsonian library, including its various branches, numbered about 932,740 volumes.

Recorded visitors to the Smithsonian group of buildings totalled 2,867,544; to the National Gallery of Art, 1,503,148; and to the National Zoological park, 3,460,400. (A. Wt.)

Snyder, John Wesley (1896–), U.S. secretary of the treasury, was born on June 21 in Jonesboro, Ark. He attended Vanderbilt university, Nashville, Tenn. (1914–15), joined the army in 1917, and after World War I entered the banking business in Arkansas and Missouri. In 1931 he joined the field service of the comptroller of the currency of the U.S. and served with this office until 1937, when he became head of the St. Louis, Mo., agency of the Reconstruction Finance corporation. During World War II he helped organize the Defense Plant corporation, an RFC subsidiary, and as its operational vice-president and director he administered the agency's commitments of more than $10,000,000,000 to finance war plants. He was vice-president of the First National bank of St. Louis from Jan. 1943 to April 1945 when he became federal loan administrator. On July 17, 1945, he was appointed director of the Office of War Mobilization and Reconversion, and in June 1946, Pres. Harry S. Truman named him secretary of the treasury.

It was his obligation during 1951 to help steer through congress the bills to implement President Truman's tax policy, including the $10,000,000,000 tax increase the president sought in January. On May 29 he was nominated for a second five-year term as U.S. governor of the International Monetary fund and the International Bank for Reconstruction and Development. He launched on Sept. 3 the biggest postwar U.S. savings bond drive, intended to reverse the trend toward more redemptions of bonds than new purchases. On Sept. 14 he advocated the lifting of international trade curbs as a prelude to more liberal use of the International Monetary fund.

Soaring: *see* GLIDING.

Soccer. International matches marked the U.S. 1951 season with England, Scotland, Sweden and Germany all sending over teams. The visitors captured the big share of

MIGUEL RUGILO (left), Argentine goalkeeper, doing a high kick during an international soccer match with British players at London, Eng., in May 1951. The British team took the match 2 to 1 the victories. The Fulham club of London took part in ten contests, winning six, losing two and tying two, and the Celtics of Glasgow compiled a record of seven triumphs, one defeat and one draw while on tour. The A.I.K. club of Stockholm won ten, lost two and was deadlocked once, and the Eintracht club of Frankfurt, Ger., annexed six decisions and lost two. An All-England squad, on its way to Australia, stopped off in New York long enough to rout the American league All-Stars, 4–0.

A team of American league stars visited Israel, where it won once and lost twice, while Penn State's (State College, Pa.) powerful eleven made a good-will trip for contests in Iran. The New York Americans played four contests in Bermuda, winning three and tying one.

The German-Hungarian Soccer Club of Brooklyn dominated the sport nationally, capturing the National Challenge cup, the National Amateur Challenge cup and the German-American league championship. The Philadelphia Nationals won the Lewis cup after taking the American league crown and the Paterson-Dover Football club of Paterson, N.J., was victor in the National league.

Army, Eastern league victor; Lehigh university, Bethlehem, Pa., Middle Atlantic States conference champion; and Penn State were among the top elevens in college competition. (*See* also FOOTBALL.) (T. V. H.)

Socialism.

Western Hemisphere.—In the United States, the Socialist party functioned primarily throughout the year 1951 as an educational force. In April the party membership approved a referendum which made possible Socialist support of non-Socialist candidates when, among other things, such non-Socialists stood as defenders of civil liberties and were advocates of improved social legislation. The party joined during the year with the Social Democratic federation in organizing a United Democratic Socialist league, which sought full membership in the Socialist International.

In Canada, the Co-operative Commonwealth federation continued its vigorous opposition to the policies of the Liberal and the Progressive Conservative parties. Its parliamentary representation was 13. In Saskatchewan the C.C.F. constituted the government party under Premier T. C. Douglas. In Latin America, Socialists' activities were restricted or prohibited in many countries. They were represented by small delegations in the parliaments of Chile, Costa Rica and Uruguay.

Great Britain.—In Europe the most important Socialist party during the year was the British Labour party. On Feb. 15, 1951, the Labour government nationalized the steel industry, and constituted the public Iron and Steel Corporation of Great Britain as a holding and policy-making body for the industry. Each of the 80 firms acquired by the government was permitted, however, to continue to work under the control of the existing directors and executives.

On account of the difficulty of functioning effectively as a government with but a slight majority of seats, Prime Minister Clement R. Attlee in the fall called for a parliamentary election to be held on Oct. 25. The election resulted in the return to parliament of 321 Conservative candidates and 294 Labourites, although Labour obtained a larger popular vote than the Conservatives. Winston Churchill succeeded Clement Attlee as prime minister, and Labour again became the country's chief opposition. On assuming office, Churchill declared that, while his government would denationalize steel, it would not attempt to turn back to private control other industries nationalized by the Labour government.

European Continent.—On the continent of Europe the Socialists in the Scandinavian countries remained as the countries' largest parties. In Norway an all-Labour cabinet served throughout the year as the nation's government. In November Oscar Torp, chairman of the Labour party, became the premier in place of Einar Gerhardsen, who had unexpectedly resigned. In the October elections, the Labour party increased its proportionate vote for council seats from 38.8% (1947) to 43.7% of the total.

In Sweden the all-Social Democratic government was reorganized on Oct. 1, and 4 seats in the cabinet were given to members of the Agrarian party, the Social Democrats retaining 12 of the important cabinet posts.

After the elections of April 3 in Denmark the Social Democrats continued to hold 33 seats out of 76 in the *Landsting*.

In Finland the Social Democrats elected 53 out of 200 seats in the July elections; the Agrarians 51; the Communist coalition 43; others 53. The Socialist-controlled Finnish Trades Union federation during the summer voted to leave the World Federation of Trade Unions, and to send observers to the Milan meeting of the anti-Communist International Confederation of Free Trade Unions.

In France the Socialist representation in the national assembly was increased, as a result of the June elections, from 99 to 104, the second largest assembly representation, while the Communist party parliamentary membership shrank to 103. General Charles de Gaulle's R.P.F. moved into first place with a parliamentary membership of 118. Socialist leader Vincent Auriol remained president of France, and Socialists during the year moved in and out of France's coalition cabinets.

In western Germany Social Democrats functioned powerfully under the leadership of Kurt Schumacher as the chief opposition. The party opposed the Schuman plan and the Allied plan for German rearmament; urged the German "reunification in a free state, based on right" and vigorously attacked all Communist attempts to dominate labour and other German organizations, while opposing the banning of the Communist party through court action. In late January Ernst Reuter, Social Democrat, was re-elected Oberbürgermeister of Berlin.

Theodor Koerner, Socialist mayor of Vienna, was elected president of Austria by a 4% majority. Adolf Schaerf, Socialist party chairman, continued during the year as the country's vice-chancellor.

The chief event during 1951 in the Socialist movement in Italy was the merger in the spring of the Socialist Party of Italian Workers, led by Giuseppe Saragat, with the Unitary Socialist party, led by Giuseppe Romita and Ignazio Silone. The representation of the merged parties in the chamber of deputies was 34. In order to effect the merger, the Saragat faction agreed to withdraw from the coalition cabinet of Alcide de Gasperi, while the Romita-Silone faction agreed to support western rearmament and the North Atlantic treaty and "to abandon systematic opposition to the government in all matters concerning a choice between democracy and dictatorship."

In the Netherlands Willem Drees, leader of the Labour party, remained as prime minister and leader of a coalition cabinet. In Belgium the Socialist party was in the opposition during the year under the leadership of former premier Paul-Henri Spaak, who served most of the year as chairman of the European Consultative assembly. The Belgian Socialists won their long battle in behalf of the abdication of King Leopold when the king on July 16 abdicated in favour of Prince Baudouin.

In Greece, Socialists in 1951 participated in the country's coalition cabinet.

Near and Far East.—In the middle east and far east the only Socialist party in control of the governmental machinery during 1951 was the Mapai party in Israel, although leaders of the government in India and other Asian countries identified themselves as believers in Socialist principles.

In the general elections of July 30 in Israel, the Mapai party again received the highest number of votes—39.1% of the total—and elected 45 out of 120 representatives to the *Knesset* (national assembly). Following the elections, David Ben-Gurion, Socialist prime minister, had difficulty during the fall in forming a government composed of Socialists and members of the country's religious parties, because of differences over the continuance of rationing and the observance of certain Orthodox religious practices.

In Australia and New Zealand Labour and Socialists remained in the opposition. In the general elections of April 28 in Australia, Labour lost control of the upper house. Following these elections Labour was represented in the senate by 28 members out of 60. In the house of representatives, Labour held 52 seats, the Liberals 52 and the Country party 17. The Labour party in September successfully opposed the referendum for the outlawing of the Communist party, on the ground that the powers given to the prime minister would be too sweeping.

In Asia the Socialist party of Japan continued to function as the third largest party. In India Socialists increased their activity and strength in industrial and agricultural centres, and became increasingly critical of many of the policies of the Congress party. In Indonesia and other countries of southeast Asia Socialists were active in combating Communist influence in the labour movement, and in urging the adoption of Socialist policies by their respective governments.

The Socialist International.—In the international field, Socialists formed a new international at a conference at Frankfurt-on-Main, Ger., June 30 to July 3, 1951. The Socialist International there formed was described by its founders as "an association of parties which seeks to establish democratic socialism . . . ; to strengthen relations between the affiliated parties and to coordinate their political attitudes and actions by consent."

The conference endorsed the principle of collective security and maintained that "free democracies cannot defend themselves against the threat of totalitarianism without arms," but insisted that arms themselves were not enough—democracies must have a constructive social and economic program aiming at the elimination of poverty, oppression, exploitation and mass employment.

In the conference's "Declaration of Aims and Tasks of Democratic Socialism," the delegates declared that, while democratic Socialists favoured public ownership of basic industries, they did not urge nationalization of all industry; under democratic socialism some industries would continue in private hands, while others would be operated by voluntary co-operative groups. Nationalization of industry was not an end in itself, but a means to an end, the satisfaction of basic human needs. "Socialists," the declaration concluded, "work for a world of peace and freedom, for a world in which the exploitation and enslavement of men by men and peoples is unknown, for a world in which the development of the individual personality is the basis for the fruitful development of mankind." (*See* also COMMUNISM; DEMOCRACY.) (H. W. L.; N. T.)

Socialist Soviet Republics: *see* UNION OF SOVIET SOCIALIST REPUBLICS.

Social Security.

The year 1951 saw new social security programs or complete new consolidated legislation enacted in Canada, which adopted a program of universal pensions for the aged, and in Bolivia, China, Greece and Haiti. The United Nations also expanded its program of technical assistance in social welfare, in which the federal agencies of the United States participated.

United States.—Large-scale changes in the social security program in the United States resulted from the 1950 amendments to the Social Security act. The amendments extended coverage and liberalized benefits under old-age and survivors insurance; they also broadened and liberalized federal grants to the states for public assistance and maternal and child health and welfare services. Amendments to the Railroad Retirement act, adopted in Oct. 1951, provided more protection for railroad workers and their families.

Social Insurance and Related Programs.—The federal program of old-age and survivors insurance, administered by the Social Security administration of the Federal Security agency, was established to provide monthly benefits related to previous earnings for insured, retired workers at age 65 and supplementary benefits to their children under age 18, to their wives if aged or having such entitled children in their care, and to the dependent, aged husbands of women workers. The program also provided survivor benefits to the widows and children, dependent parents and dependent, aged widowers of deceased insured workers, as well as lump sum death payments. Benefits were suspended for any month in which a beneficiary under age 75 had wages of more than $50 or an equivalent amount of net earnings from self-employment in covered work and had rendered substantial services in such work. At the end of Oct. 1951, monthly benefits totalling $151,825,500 were being paid to 4,290,791 individuals. About two-thirds of the beneficiaries were retired workers and their aged wives or husbands, one-fifth were young children, and the others were the widows and dependent, aged widowers and parents of deceased workers. As of June 1951 the average monthly benefit for a family consisting of a widowed mother and one child beneficiary was $75; for an aged widow $36.20; for a retired man $43.50; and for a man and his aged wife $70.40. The program was being financed by contributions from employers and employees of 1½% each on wages up to $3,600 a year and, from January 1951, by contributions of the self-employed (except farmers and members of certain professions) of 2¼% of earnings up to $3,600. The amendments extended coverage to new groups, and in June 1951 almost 46,000,000 workers were in covered jobs.

Payments were also being made under other public programs. In Oct. 1951 monthly retirement, disability and survivor benefits were being paid to beneficiaries under the railroad retirement program (414,500), veterans' programs (3,404,100) and the federal civil service (202,400). Under plans for state and local government employees, retirement, disability and survivor benefits were being paid to a large group of beneficiaries. Disability benefits under these plans and payments under the program of aid to the permanently and totally disabled were the only payments made under public programs because of permanent disability that was not work-connected. For temporary disability of nonwork-connected origin, public provision was limited to the temporary disability insurance systems in effect in four states and in the railroad industry. For work-connected disability, workmen's compensation programs were in effect for workers in all states and for federal employees.

The state-federal system of unemployment insurance pays benefits to qualified, unemployed workers. The federal aspects of the system are administered by the department of labour. Benefits are financed by employer contributions. In Oct. 1951 a weekly average of 712,800 unemployed workers drew benefits; total benefits in the month were $67,449,000. Workers in 11 states had their weekly benefits supplemented by small allowances for dependents.

Protection against wage loss from unemployment was also available to railroad employees under the Railroad Unemployment Insurance act. In Oct. 1951 about $1,376,000 was paid to an average 21,200 workers (average number in a 14-day period).

Assistance and Welfare.—The four special types of public assistance—old-age assistance, aid to dependent children, aid to the blind and, from Oct. 1950, aid to the permanently and totally disabled—are administered and financed by the states or the local communities or both, with the federal government sharing in the costs within certain maximum amounts. Federal grants to the states for this purpose in the fiscal year 1950–51 amounted to $1,202,000,000; for assistance and administration for these four programs total expenditures—federal, state and local—were $2,260,000,000. In Oct. 1951, 2,710,300 needy persons aged 65 or over were receiving old-age assistance; the average payment was $44.54; 2,056,200 persons (including 1,532,900 children) in 596,800 families were receiving aid to dependent children (average payment per family, $74.84); 97,200 were receiving aid to the blind (average payment, $47.75); and 114,200 disabled persons in 35 reporting states were receiving aid to the permanently and totally disabled (average payment, $46.13). About 312,000 cases (an estimated 597,100 persons) were receiving general assistance, financed by states and localities without federal assistance; the average payment per case was $46.21. The averages did not include payments made by the states directly to doctors or others supplying medical care to assistance recipients.

The Social Security act also authorized federal grants to the states, administered by the children's bureau, to extend and improve their maternity services for mothers and their health and welfare services for children, including services for crippled children. During the fiscal year ended June 30, 1951, about $13,000,000 was paid to the states for maternal and child health services; typical of these services, most of them designed to help mothers and children keep well, were prenatal clinics, visits to homes by public health nurses, well-child clinics for children of preschool age and health services for school children. Grants for services for crippled children totalled about $10,000,000; the programs provided diagnostic, medical and surgical services and hospital and convalescent care. Grants of about $6,000,000 were made for child welfare services.

(*See* also under article on each state.) (A. J. A.)

Canada.—The federal Old-Age Security act passed by parliament on Nov. 8, 1951, guaranteed $40 per month from the federal treasury for all Canadians over 70 without any means test. Payments started Jan. 1, 1952, with an estimated yearly cost of $342,000,000, to be raised by new taxes of 2% on personal and corporate incomes, and a 2% sales tax. At the year-end, applications for the pension were being processed at the rate of 7,000 weekly, and the estimated total number of beneficiaries for the start of the scheme was set at 730,000 (against 320,000 old-age pensioners in 1951).

The Old-Age Security act was preceded (June 23) by the federal Old-Age Assistance act, which authorized the federal government to share on a 50–50 basis with the provinces the cost of a $40 monthly pension to needy persons between 65 and 69 years. On the same date parliament passed the Blind Persons act, establishing for the first time in Canadian history separate legislation providing for assistance to the blind. The act authorized the federal government to make payments to the provinces covering 75% of $40 per month blindness allowances.

By mid-1951 family allowances were being paid at the rate of more than $27,000,000 per month to 1,934,238 families on behalf of 4,438,958 children (an average of $13.79 per family).

Provincial social security measures of importance included the following: Ontario increased mothers' allowances in cases of need, barred employment discrimination because of colour or creed or place of origin, increased workmen's compensation benefits; Nova Scotia prohibited a long list of heavy industries, hotels, restaurants and bowling alleys from employing children under 14. The Newfoundland Workmen's Compensation act went into force on April 1, 1951. (C. Cy.)

Great Britain.—An important feature of the national insurance scheme was the provision of increments of retirement pensions which could be earned by continuing work beyond the minimum pension age. The rate of these increments was increased from 1*s.* to 1*s.* 6*d.* for every 25 contributions paid on or after July 16, 1951. The increments of a wife's pension paid on her husband's insurance remained at 1*s.* during his lifetime, but if he died before her, any 1*s.* increments he had earned for her since July 16, 1951, would then be paid to her at the 1*s.* 6*d.* rate. As a result of these bigger increments, a man who continued in full-time employment until 70 years of age could earn increments of 15*s.* for himself and 10*s.* for his wife, if she was not more than five years younger than he. This meant that he and his wife could then qualify for a combined retirement pension of 75*s.* a week for life. If his wife survived him, her pension would then be 45*s.* a week.

The revised insurance regulations included amended earning rules to encourage retirement pensioners to take up part-time work. The amount which a retirement pensioner could earn without any reduction of his pension was increased from 20*s.* to 40*s.* a week. The amount which a widow drawing a widowed mother's allowance could earn without a reduction of her allowance was increased from 30*s.* to 60*s.* a week. For a widow drawing the 26*s.* widow's pension, the amount was increased from 30*s.* to 40*s.* a week. The basic rate for retirement pensions was increased by 4*s.* for men of 70 and over and for women of 65 and over. The allowance for widowed mothers was also increased, and increases were given in respect of the children of pensioners drawing benefits or pensions. The cost of the new arrangements was estimated at £39,000,000 in the first year. No increase in existing contributions was considered necessary to meet this cost, beyond the extra 4*d.* a week which was already due to come into force under the original scheme. National assistance scales were also increased, so as to provide 50*s.* a week for a married couple, plus an allowance for rent.

The rate for each dependent child was increased by 1*s.* 6*d.* a week.

Voluntary organizations played an important part in co-operating with the state and local authorities in the social services in Great Britain. This was particularly noteworthy in the field of old people's welfare. The National Council of Social Services provided an opportunity for the co-operation of voluntary organizations, and 77 voluntary bodies were represented on the central body. The government recognized the value of this organization by the appointment of representatives from ten departments and the local authorities were represented by their associations. There were also a number of individual members on the council. The co-ordination of voluntary effort for old people was the responsibility of the National Old People's Welfare committee, which worked in association with the National Council of Social Services. There were 41 national voluntary bodies represented on this committee, and there were also regional and county committees represented on the national committee. The Women's Voluntary services established a large number of old people's clubs on a part-time basis, but an increasing number of whole-time clubs were also established mainly through the stimulus given by local old people's welfare committees. There were 48 county committees and 702 local committees. Another organization concerned with the welfare of old people was the National Corporation for The Care of Old People, which was established by the governing body of the Lord Mayor's Air Raid Distress fund and the Nuffield foundation. (Jn. M.)

Social Service: *see* CHILD WELFARE; SOCIAL SECURITY.

Societies and Associations, U.S.

The following is a selected list of U.S. societies and associations, with date of founding, membership, officers and chief activities during 1951. (*See* also the separate articles on RED CROSS; VETERANS' ORGANIZATIONS; etc.)

Alcoholic Foundation, Inc. (Alcoholics Anonymous).—Alcoholics Anonymous is a fellowship of men and women organized in 1935 to help the alcoholic recover sobriety. There are no dues or fees, and the only requirement for membership is stated to be "an honest desire to stop drinking." The foundation, which was organized in 1938, is a nonprofit membership corporation serving as a general service board for the Alcoholics Anonymous movement. It publishes the book *Alcoholics Anonymous* and the monthly *The A.A. Grapevine*. There are no national officers, nor is there an endowment, the foundation being supported solely through voluntary contributions. Headquarters: P.O. Box 459, Grand Central Annex, New York 17, N.Y.

American Academy of Arts and Letters.—The purpose of the academy, founded April 23, 1904, is to protect and further literature and the arts. On May 25, 1951, the academy held a special meeting followed by a joint public ceremonial with the National Institute of Arts and Letters at which medals and honours and 15 arts and letters grants of $1,000 were awarded to artists, writers and musicians. Its publications include art catalogues; *Proceedings; Commemorative Tributes;* and *Blashfield Papers.* Officers (1951): Paul Manship, president; Archibald MacLeish, chancellor; Mark van Doren, secretary; Deems Taylor, treasurer. Headquarters: 633 W. 155th St., New York 32, N.Y.

American Academy of General Practice.—The academy was founded in 1947 to improve the professional abilities of physicians through postgraduate study, to gain for them wider opportunities for the practice of those abilities in U.S. hospitals and to assure the family doctor of a better understanding on the part of the public and the rest of the medical profession of his role in medical care. Membership, which is open to all physicians engaged in the general practice of medicine and surgery, numbered 14,000 in 1951. The Annual Scientific assembly was held in San Francisco, Calif., March 19–22, 1951. The academy has no endowment, its activities being supported by membership fees. Publication: *"GP"* (monthly). Officers (1951): J. P. Sanders, Shreveport, La., president; Fred A. Humphrey, Fort Collins, Colo., vice-president; M. F. Cahal, Kansas City, Mo., executive secretary and general counsel. Headquarters: 406 W. 34th St., Kansas City 2, Mo.

American Academy of Political and Social Science.—Founded in 1889 and incorporated in 1891, this organization acts as a forum for the discussion of social, political and economic questions through meetings and publications. Membership in 1951 was more than 16,000. Publication: *The Annals,* a bimonthly journal. Officers (1951): Ernest M. Patterson, president; J. P. Lichtenberger, secretary. Headquarters: 3817 Spruce St., Philadelphia 4, Pa.

American Association for the Advancement of Science.—Founded in 1848, this association seeks to further the work of scientists, facilitate cooperation among them and improve public understanding of the importance of science in human progress. Its membership in 1951 was 48,000; endowment, $250,000. During 1951 a new section was organized covering the industrial sciences, and a new division was formed covering science in Alaska. The annual meeting was held in Philadelphia, Pa., in Dec. 1951. Publications: *Science,* weekly, and *Scientific Monthly.* Officers (1951): Kirtley F. Mather, president; Howard A. Meyerhoff, administrative secretary. Headquarters: 1515 Massachusetts Ave., N.W., Washington 5, D.C.

American Association of Law Libraries.—Founded in 1906 to cultivate the science of law librarianship and increase the usefulness of law libraries, this association in 1951 numbered 612 members. During 1951, it began a project to prepare cataloguing rules for law books by revision of American Library association rules, and continued the preparation of a check list of American Bar association publications. Publications: *Law Library Journal; Index to Legal Periodicals; Interim Index to Legal Periodicals; Law Libraries of the U.S. and Canada.* Officers (1951): George A. Johnston, president; Elizabeth Finley, treasurer; Margaret E. Coonan, secretary. Headquarters: New Jersey State Law Library, State House Annex, Trenton, N.J.

American Association of University Professors.—This organization of college and university teachers was founded in 1915 to promote discussion and action on problems affecting education in institutions of higher learning, and to provide means for expression of its membership. Its members in Jan. 1951 totalled 40,626. Publication: the *Bulletin,* a quarterly journal. Officers (1951): Richard H. Shryock, The Johns Hopkins university, president; Ralph E. Himstead, general secretary. Headquarters: 1785 Massachusetts Ave. N.W., Washington 6, D.C.

American Association of University Women.—This organization was founded in 1882 as the Association of Collegiate Alumnae for "the uniting of the alumnae of different institutions for practical educational work." Membership in 1951 totalled 120,675. During 1951, 27 fellowships, $1,500 to $2,500 each, were awarded to women scholars for advanced research; 51 women from other countries were awarded grants covering expenses of study in the U.S. The number of approved colleges and universities whose graduates were eligible for A.A.U.W. membership totalled 314 in 1951. Publications: *Journal,* quarterly; the *General Director's Letter,* handbooks, study guides and bibliographies. Endowed funds totalled $1,089,199 in 1951. Officers (1951): Susan B. Riley, president; Mrs. Arthur J. White, treasurer; Mrs. Charles Sidney Bluemel, recording secretary. Headquarters: 1634 I St. N.W., Washington 6, D.C.

American Bankers Association.—Founded in 1875, the primary objective of this organization is to promote the general welfare and usefulness of banks and financial institutions. In 1951 it had a membership of 16,693 banks and banking offices. In its four divisions it operated through about 40 working groups. It is the parent organization of the American Institute of Banking for bank employees and the Graduate School of Banking for bank officers. In 1951, faced with the problem of providing credit for production of essential military and civilian goods while avoiding loans which could be classified as speculative, the association initiated a nationwide voluntary credit restraint program. Officers (elected at the 77th annual convention held in Chicago, Ill., October 3, 1951): C. Francis Cocke, First National Exchange bank, Roanoke, Va., president; W. Harold Brenton, State Bank of Des Moines, Ia., vice-president; William B. Gladney, Fidelity National bank, Baton Rouge, La., treasurer. Headquarters: 12 E. 36th St., New York, N.Y.

American Bar Association.—Founded in 1878 to advance the science of jurisprudence and promote the administration of justice in the U.S., the association numbered 45,628 members as of Sept. 15, 1951. In 1951 the annual medal for conspicuous service to U.S. jurisprudence was awarded to Reginald Heber Smith for his work as director of the survey of the legal profession; the Ross prize went to Paul G. Kauper for his essay "The First Ten Amendments . . ." Its publications include the *American Bar Association Journal,* an annual volume of reports and proceedings, and various pamphlets. Officers (1951): Howard L. Barkdull, president; Roy E. Willy, chairman of the house of delegates; Joseph D. Stecher, secretary; and Harold H. Bredell, treasurer. Headquarters: 1140 N. Dearborn St., Chicago 10, Ill.

American Bible Society.—Founded in 1816, the society encourages the wider circulation and use of the Holy Scriptures without note or comment and without purpose of profit. In 1951 manuscripts of the Scriptures in primitive languages were studied, and special committees were engaged in revising the Spanish and Portuguese Bibles. The Korean Bible in the Hankul spelling and an illustrated edition in English and Spanish of the *Acts of the Apostles* were published; about 11,056,580 copies of the Scriptures were distributed. Membership (1951): 250,000. Publication: *The Bible Society Record.* Officers (1951): Eric M. North, Frank H. Mann and Robert T. Taylor, general secretaries; Francis C. Stifler, recording secretary; Gilbert Darlington, treasurer. Headquarters: 450 Park Ave., New York 22, N.Y.

American Chemical Society.—Founded in 1876, the society's purpose is to encourage the advancement of chemistry, promote research in chemical science and industry, maintain high professional and ethical standards and promote the diffusion of knowledge on chemical subjects. Nine medals and awards were conferred at the Diamond Jubilee, which was held in New York city Sept. 3–7, 1951, and a commemorative U.S. postage stamp was issued during the year. The membership in 1951 was about 66,000. Publications include *Journal of the American Chemical Society; Industrial and Engineering Chemistry; Analytical Chemistry; Chemical and Engineering News;* and *Chemical Abstracts.* Officers (1951): N. Howell Furman, president; Alden H. Emery, executive secretary; Robert V. Mellefont, treasurer. Headquarters: 1155 16th St., N.W., Washington 6, D.C.

American College of Dentists.—The association was formed Aug. 20, 1920, to advance the standards and efficiency of dentistry, stimulate graduate study in dentistry, confer fellowships in recognition of meritorious achievement in the science and improve public understanding of oral health service. Membership in 1951 was 1,658. Activities throughout 1951 were carried on through standing committees, and included the establishment of emergency and travel funds for research workers and a teachers' training program. The *Journal of the American College of Dentists* is published quarterly. Officers (1951): Henry O. Lineberger, Raleigh, N.C., president; Edgar H. Keys, St. Louis, Mo., vice-president; Otto W. Brandhorst, St. Louis, Mo., secretary. Headquarters: 4952 Maryland Ave., St. Louis, Mo.

American College of Life Underwriters.—Founded in 1927 to establish an educational standard for the profession of life underwriting and to encourage formal training for this field, the organization awards qualified candidates a professional certificate of recognition. At the end of 1951, 4,129 had been awarded this certificate (C.L.U.) and 107 had received certificates of proficiency. In June 1951, 2,310 candidates took examinations for the certificate at 140 universities and colleges, and a total of 3,201 tests were taken during the year. A total of 4,419 persons had completed the five examinations necessary for the certificate, and 5,956 others had credit for one or more of the examinations. Publications: *Annual Announcement, Annual Report* and brochures. An endowment of $42,000 was raised in addition to about $64,000 received annually from contributing life insurance companies. Officers (1951): Julian S. Myrick, chairman of the board; S. S. Huebner, president; Joseph H. Reese, secretary. Headquarters: 3924 Walnut St., Philadelphia 4, Pa.

American College of Physicians.—This society was founded May 11, 1915, to bring together physicians of high standing for the maintenance and advancement of medical education, practice and research. Membership in 1951 totalled 7,400, and activities included the 32nd annual session in St. Louis, Mo., plus 30 regional or state meetings in the U.S., Puerto Rico and Canada; 17 advanced postgraduate courses were conducted in internal medicine and related fields. The college also awarded six research fellowships in internal medicine and, in conjunction with the W. K. Kellogg foundation, 16 Latin-American fellowships for training in the U.S. of teachers from Latin-American medical institutions. Publications include a directory and *Annals of Internal Medicine,* a monthly. Endowment funds totalled $395,000. Officers (1951): Maurice C. Pincoffs, Baltimore, Md., president; Richard A. Kern, Philadelphia, Pa., secretary-general; Edward R. Loveland, Philadelphia, executive secretary. Headquarters: 4200 Pine St., Philadelphia 4, Pa.

American College of Surgeons.—Founded in 1913 to advance the science of surgery, the organization held its 37th clinical congress in San Francisco, Calif., Nov. 5–9, 1951. Surveys of hospitals and tumour clinics and graduate training programs were continued in 1951. Membership of the college in 1951 was 16,982. Publications: *Surgery, Gynecology and Obstetrics* and the *Bulletin.* Officers (1951): Henry W. Cave, president; Paul R. Hawley, director; Michael L. Mason, secretary. Headquarters: 40 E. Erie St., Chicago 11, Ill.

American Dental Association.—Founded in 1859 "to encourage the improvement of the health of the public and to promote the art and science of dentistry," this professional association numbered 76,031 members as of Nov. 30, 1951. It continued support of measures to add fluoride salts to community water supplies to reduce incidence of tooth decay, and by Dec. 1951, more than 150 U.S. cities and towns were fluoridating their water supplies. The association in February sponsored its third annual national children's dental health day. Its house of delegates endorsed in principle the establishment of pre-payment dental plans and urged the development of public health units. Publication: *Journal of the American Dental Association.* Officers (1951–52): LeRoy M. Ennis, president; Harold Hillenbrand, secretary; H. B. Washburn, treasurer. Headquarters: 222 E. Superior St., Chicago 11, Ill.

American Dialect Society.—This organization was founded at Harvard university in 1889 to collect, study and publish linguistic material, especially dialect, found among the people of the U.S. and Canada. A southern section of the society, organized in 1951, met in Atlanta, Ga., in November. In December the regular annual national meeting was held in Detroit, Mich. Activities in 1951 included studies of the dialect, popular and scientific names of some plants found in America, oil terminology and the argot of the racetrack. Membership in 1951 was 568. Publications: *Dialect Notes, 1890–1939* (6 vol.); *Publication of the American Dialect Society.* Officers (1951): E. H. Criswell, president; George P. Wilson, secretary-treasurer. Headquarters: Woman's College of the University of North Carolina, Greensboro, N.C.

American Economic Association.—This association, which in 1951 had 7,300 members and 2,600 library, corporate and individual subscriptions, was founded in 1885 to encourage economic research and freedom of economic discussion, and to issue publications on economic subjects. The 64th annual meeting was held in Boston, Mass., Dec. 26–29, 1951. Publications include the *American Economic Review,* quarterly; *Papers and Proceedings* of the annual meeting; and a directory. Officers (1951): John H. Williams, Harvard university, president; James Washington Bell, Northwestern university, secretary-treasurer and editor of the annual proceedings; Paul T. Homan, University of California, managing editor of the quarterly. Headquarters: Northwestern university, Evanston, Ill.

American Geographical Society.—Founded in 1852 to promote geographical research and exploration and to disseminate geographical knowledge, the society celebrated on Nov. 8, 1951, the 100th anniversary of its first regular meeting. In connection with the long-term program of glaciological studies, work was continued during the summer of 1951 on the Juneau, Alsk., ice field research project. Revision was completed on the society's 1:5,000,000 map of the Americas and the drafting was completed of a new map of the Americas on the scale of 1:12,500,000. Publications include: *Geographical Review; Current Geographical Publications; Focus,* a monthly magazine; monographs and maps. Membership: about 4,500. Officers (1951): Richard Upjohn Light, president; George H. T. Kimble, director. Headquarters: Broadway at 156th St., New York 32, N.Y.

American Historical Association.—This association of professional and nonprofessional students of history was founded in 1884 to promote historical studies, collect and preserve historic manuscripts, and promote sound teaching of American history. It was incorporated by act of congress in 1889. The association's membership in 1951 was about 5,800, and its endowment was $279,000. Publications include the *American Historical Review* and selected historical monographs. Officers (1951): Robert L. Schuyler, Columbia university, president; Guy Stanton Ford, Washington, D.C., executive secretary. Headquarters: Study Room 274, Library of Congress Annex, Washington 25, D.C.

American Institute for Property and Liability Underwriters, Inc.—Founded in 1942, this organization strives to establish an educational standard for the profession of property and casualty insurance underwriting. In June 1951, 1,617 persons took examinations which are held by the institution for certification of underwriters. In addition, 1,712 persons had credit for one or more of the five examinations which were held at 112 universities and colleges in 41 states, the District of Columbia, Hawaii and Canada. At the end of 1951 a total of 687 examinees had received the C.P.C.U. designation. Publication: *Announcement,* annual. Officers (1951): S. S. Huebner, chairman, board of trustees; H. C. Conick, president; A. C. Goerlich, secretary. Headquarters: 3924 Walnut St., Philadelphia 4, Pa.

American Institute of Accountants.—A national professional society of certified public accountants, founded in 1887 to maintain high professional and ethical standards, to develop accountancy education and to provide for the examination of candidates for membership. In 1951 the institute had a membership of 18,000. The year's activities included the preparing of the uniform C.P.A. examinations given in 47 states, the conducting of local and regional meetings, the issuing of bulletins on accounting procedure and case studies in auditing procedure, and recommendations for improvement of federal income-tax laws. Publications: *Journal of Accountancy* and *Certified Public Accountant,* both monthly, and others. Officers (1951) included J. William Hope, president; John L. Carey, executive director. Headquarters: 270 Madison Ave., New York 16, N.Y.

American Institute of Chemical Engineers.—This organization was founded in 1908 for the advancement of chemical engineering in theory and practice and the maintenance of a high professional standard among its members. Activities in 1951 included the annual meeting at Atlantic City, N.J., Dec. 2–5, and three regional meetings. As of Sept. 30, 1951, the membership was 11,309. Publication: *Chemical Engineering Progress,* monthly. Officers (1951) included Thomas H. Chilton, president; Stephen L. Tyler, executive secretary. Headquarters: 120 E. 41st St., New York 17, N.Y.

American Institute of Electrical Engineers.—This association was founded in 1884 to advance the theory and practice of electrical engineering and to maintain high professional standing among its members. Its 1951 activities included the development of standards for electrical equipment, the publication of technical papers and the holding of numerous meetings on subjects within its cognizance. Active work in all parts of the electrical engineering field was carried on by subcommittees and working groups of the five technical divisions: communication, general applications, industry, power, and science and electronics. Membership as of Oct. 1, 1951, was 41,893. Publications: *Electrical Engineering,* monthly; *Transactions,* annually; and *Standards* and special publications, published irregularly. Officers (1951): F. O. McMillan, president; H. H. Henline, secretary. Headquarters: 33 W. 39th St., New York 18, N.Y.

American Institute of Mining and Metallurgical Engineers.—This society was founded in 1871 to promote the arts and sciences connected with the economic production of minerals and metals, and the welfare of the individuals employed in these industries. The regular annual meeting was held in St. Louis, Mo., in Feb. 1951. Publications include *Mining Engineering, Journal of Metals* and *Journal of Petroleum Technology,* all monthly, and three volumes of steel conference proceedings. Membership in 1951 was 17,500. The institute's endowments totalled more than $956,000. Officers (1951) included W. M. Peirce, president, and Edward H. Robie, secretary. Headquarters: 29 W. 39th St., New York 18, N.Y.

American Iron and Steel Institute.—In 1908 this organization was founded to promote the interests of the iron and steel industry, distribute information and promote discussion of problems relating to the industry. Its 1951 membership included 2,383 active, associate, honorary and emeritus members, and 96 company members. Publications: *Steelways,* bimonthly; *Steel Facts,* bimonthly; and numerous booklets and pamphlets. Officers (1951) included Walter S. Tower, president; Max D. Howell, treasurer; George S. Rose, secretary. Headquarters: 350 Fifth Ave., New York 1, N.Y.

American Law Institute.—Founded Feb. 23, 1923, this organization is designed to promote the clarification and simplification of the law and its better adaptation to social needs. In 1951 the institute completed the drafting of a uniform commercial code, and it sponsored numerous courses, lectures and the distribution of literature on selected phases of the law. Work advanced in 1951 on the drafting of a federal income tax statute, and the preliminary work on a code of substantive criminal law was also begun. In 1951 there were 1,106 elected members. Headquarters, 1951: 133 S. 36th St., Philadelphia 4, Pa.

American Mathematical Society.—Established in 1888 to further the interests of mathematical scholarship and research, the society held 14 meetings during 1951. Publications: *Bulletin of the American Mathematical Society; Proceedings of the American Mathematical Society; Transactions of the American Mathematical Society; Mathematical Reviews; Colloquium Publications; Mathematical Surveys.* Membership in 1951, 4,484. Officers (1951): John von Neumann, president; E. G. Begle, secretary. Headquarters: 80 Waterman St., Providence, R.I.

American Medical Association.—This federacy of constituent state and territorial medical associations was founded in 1847 to promote the science and art of medicine and the betterment of public health. Activities during 1951 included the evaluation of a number of drugs; studies on nutrition and special foods; examinations of devices and techniques for the rehabilitation of the physically disabled; consultations on labour health proposals; and studies on emergency medical problems, teaching standards in medical schools, standards of care in hospitals and the supply of U.S. physicians. Publications: The *Journal of the American Medical Association* and several special publications. Membership in 1951 was more than 135,000. Officers (1951): John W. Cline, San Francisco, Calif., president; Louis H. Bauer, Hempstead, N.Y., president-elect; George F. Lull, Chicago, Ill., secretary and general manager. Headquarters: 535 N. Dearborn St., Chicago 10, Ill.

American Optometric Association.—Founded in 1897, this organization's purpose is to promote the visual welfare of America and serve the professional interests of optometrists. During 1951 it sponsored public information programs on various aspects of vision. Seminars met in Milwaukee, Wis., and Chicago, Ill.; the annual Congress of Optometry was held in New Orleans, La., with the theme "The Social Impact of Visual Performance." Membership in 1951 totalled 11,000. Publications: *Journal of the American Optometric Association,* published monthly, and booklets on highway vision and optometry as a vocation. Officers (1951): J. Ottis White, president; S. L. Brown, treasurer; Ernest H. Kiekenapp, secretary. Headquarters: Jenkins building, Pittsburgh 22, Pa.

American Prison Association.—Founded in 1870, this association works for the improvement of laws governing public offenders; studies the causes of crime and the nature of offenders and their social surroundings, works for the improvement of penal institutions and jobs for former prisoners. In 1951 the association sponsored the 81st annual congress of correction. Membership in 1951 was about 2,000, consisting of court, crime-enforcement and penal officials and citizens interested in crime problems. Publications include an annual directory of correctional institutions; handbook on classification in correctional institutions; and the bimonthly *Prison World.* Officers (1951): James W. Curran, president; E. R. Cass, general secretary; John L. Schoenfeld, treasurer. Headquarters: 135 E. 15th St., New York 3, N.Y.

American Society of Civil Engineers.—The society was founded in 1852 for the purpose of advancing the sciences of engineering and architecture. Membership at the end of 1951 was about 34,000. Professional activities of the society were directed through its headquarters, its professional committees, student chapters in 132 engineering colleges and the 14 following technical divisions: air transport, city planning, construction, engineering economics, engineering mechanics, highways, hydraulics, irrigation, power, sanitary engineering, soil mechanics and foundations, structural, surveying and mapping, and waterways. Publications: *Proceedings,* also several pamphlets each month; *Transactions,* yearly; *Civil Engineering,* monthly; and a *Yearbook.* Officers (1951): Gail A. Hathaway, president; (1952) Carlton S. Proctor, president; William N. Carey, executive secretary. Headquarters: 33 W. 39th St., New York 18, N.Y.

American Society of Composers, Authors and Publishers (ASCAP).—Founded Jan. 13, 1914, the society collects performing right royalties for allocation to members whose copyrighted musical works are used in public performances for profit. Its membership in 1951 totalled 2,900, comprising 2,500 composers and authors and 400 publishers. Officers (1951) included: Otto A. Harbach, president; Saul H. Bourne and Oscar Hammerstein II, vice presidents; Paul Cunningham, secretary; Louis Bernstein, treasurer. Headquarters: 575 Madison Ave., New York 22, N.Y.

American Society of Mechanical Engineers.—This organization was founded in 1880 and incorporated in 1881 to promote the art and science of mechanical engineering, to encourage original research, to foster engineering education, to advance the standards of engineering and to permit interchange of ideas among engineers themselves. In 1951 the society held four national meetings and eight professional division conferences. In addition, meetings were held by the 75 local sections and the 137 student branches. Membership totalled 35,000. Publications: *Mechanical Engineering* and *Applied Mechanics Reviews*, both monthly; *Journal of Applied Mechanics*, quarterly. Officers (1951): J. Calvin Brown, president; Clarence E. Davies, secretary. Headquarters: 29 W. 39th St., New York 18, N.Y.

American Sunday-School Union.—Founded in 1817 as the Sunday and Adult School union, this organization's aim is to establish and maintain Sunday schools and publish and circulate moral and religious literature. During 1951, 220 new Sunday schools were organized, and 55 were reorganized; 1,663 vacation Bible schools were held; and about 6,000 Bibles and 4,000 Testaments were distributed. Active missionaries in 1951 numbered 178; the 2,592 Sunday schools enrolled 98,496 scholars. In 1951, 128 Young People's societies were established. Publications included the *Sunday School World*, a teachers' quarterly; *Union Quarterly; Superintendents' Guide;* and Sunday-school literature. The work is supported largely by contributions, plus a small endowment. Officers (1951): Belding B. Slifer, president; Elliott D. Parkhill, secretary of missions; William J. Jones, editor of publications. Headquarters: 1816 Chestnut St., Philadelphia, Pa.

Boy Scouts of America.—This nation-wide youth organization with activities for boys of eight years and older was organized in 1910 and chartered by congress in 1916. Objectives are to teach patriotism and citizenship and the importance of religion in daily life. In 1951 about 750 U.S. scouts attended the world jamboree in Bad Ischl, Austria. At a national training conference of professional leaders held at East Lansing, Mich., Sept. 5–12, a three-year program was adopted with the slogan, "Forward on Liberty's Team." Civic activities included a "Get Out the Vote" campaign in November. Membership, July 31, 1951, was 2,745,576 men and boys organized in about 76,000 units. The world scout membership as of 1949 was 4,416,306 in 46 countries. Headquarters: 2 Park Ave., New York 16, N.Y.

Brookings Institution.—A nonprofit organization dedicated to public service through research and education in economics and government, the institution was founded in 1928 and is supported by income from its own endowment, grants from foundations and the sale of publications. During 1951 the following studies were published: *Major Problems of U.S. Foreign Policy, 1951–1952; A Survey of Economic Education; Current Problems in U.S. Foreign Policy* (magazine; 10 issues); *Current Issues in Foreign Economic Assistance*, by Redvers Opie; *Toll Roads—The Problem of Highway Modernization;* and *The Search for Peace Settlements*, by Redvers Opie *et al.* Officers (1951): Harold G. Moulton, president; Elizabeth H. Wilson, secretary. Headquarters: 722 Jackson place N.W., Washington 6, D.C.

Buhl Foundation.—Established in 1927, the Buhl foundation had by 1951 granted to existing (or especially established) agencies a total of $6,995,895 for the promotion of nationally significant programs in the Pittsburgh, Pa., district. These programs were in regional economics, historical and social research, in higher education and in research in natural sciences. The foundation's $1,700,000 Chatham Village, pioneering demonstration of large-scale planned residential community built for long-term investment, had received international recognition. The $1,100,000 Buhl planetarium, built and maintained as a memorial to the founder, had conducted a program of popular science education from elementary school to adult level since 1939. Foundation assets in 1951 were $13,294,291. Director: Charles F. Lewis. Headquarters: Farmers Bank building, Pittsburgh 22, Pa.

Camp Fire Girls, Inc.—Founded in 1910, this youth organization's purpose is "to perpetuate the spiritual ideals of the home" and "to stimulate and aid in the formation of habits making for health and character." In 1951 Camp Fire Girls observed Birthday week (theme: "Everybody Counts"), March 11 through March 17, and conducted a membership drive, Sept. 15 through Nov. 30. Activities also included participation in a safety campaign and defense programs. In 1951 more than 369,600 girls were reported enrolled in its three groups: Blue Birds, 7 to 10 years old; Camp Fire Girls, 10 to 15 years old; and Horizon club members, of senior high school age. Publications: *Your Symbol Book; Camp Fire's Part in Defense; Exhibits That Work for You* (rev.); *Your Publicity P's and Q's* (rev.). National officers (1951): Mrs. Richard W. Blalock, president; George W. Hearn, chairman of the board; Mrs. R. L. Heminger, secretary; Martha F. Allen, national director. Headquarters: 16 E. 48th St., New York 17, N.Y.

Carnegie Trusts.—Six autonomous and separately administered agencies in the U.S. were established by Andrew Carnegie for various philanthropic purposes; in addition, there are four Carnegie trusts in Great Britain, and Carnegie Hero funds operate in nine European countries.

Carnegie Corporation of New York (1911), with a basic endowment of $135,000,000, had in 1951 assets of more than $175,000,000; the income from $12,000,000 of this is applicable in the British dominions and colonies. It included in its 1951 program the advancement of education through support of specific undertakings in institutions of higher education and in organizations engaged in research and public education. The primary interest is in the advancement of the social sciences and in the improvement of teaching. President (1951), Charles Dollard; secretary, Robert M. Lester. Headquarters: 522 Fifth Ave., New York 36, N.Y.

Carnegie Institute of Pittsburgh (1896) includes a department of fine arts, a music hall and a museum of natural history, and to it are closely related the Carnegie Library of Pittsburgh, the Carnegie Library school and the Carnegie Institute of Technology. President (1951), James M. Bovard; secretary, Augustus K. Oliver. Headquarters: 4400 Forbes St., Pittsburgh 13, Pa.

Carnegie Institution of Washington (1902), with assets exceeding $45,000,000 in 1951, conducts fundamental scientific investigation, particularly in astronomy, terrestrial magnetism, plant biology, embryology, genetics and historical research. President (1951), Vannevar Bush; executive officer, Paul A. Scherer. Headquarters: 1530 P St., N.W., Washington 5, D.C.

Carnegie Hero Fund Commission (1904), with assets in 1951 of approximately $10,000,000, was established to recognize by medals and monetary awards heroic acts performed in the peaceful walks of life. President (1951), Thomas S. Arbuthnot; manager, M. H. Floto. Headquarters: Oliver building, Pittsburgh 22, Pa.

Carnegie Foundation for the Advancement of Teaching (1905) was established to provide retiring pensions for teachers and to advance higher education; it received $31,000,000 from Carnegie and substantial additional sums from the Carnegie corporation for a program to improve graduate education in southern colleges. President (1951), Oliver C. Carmichael; secretary, Robert M. Lester. Headquarters: 522 Fifth Ave., New York 36, N.Y.

Carnegie Endowment for International Peace (1910) uses the income from its $10,000,000 endowment to further friendly understanding among nations, its aim in 1951 being to support the United Nations by stimulating public education in foreign affairs and by conducting studies and seminars. President (1951), Joseph E. Johnson; secretary, Leslie Paffrath. Headquarters: 405 W. 117th St., New York 27, N.Y.

Catholic Community Service, National.—This service organization was founded on Nov. 13, 1940, as the agency designated by the Catholic bishops of the U.S. to mobilize and co-ordinate the Catholic resources of the country to assist in serving the spiritual, educational, recreational and welfare needs of the men and women in the armed forces, their families and patients in Veterans administration hospitals. During 1951 the service conducted volunteer work in 143 hospitals and also conducted programs in 48 activities near major military establishments in the U.S. and overseas. Publications: *NCCS News Bulletin; NCCS VA Hospital News;* and *Focus on Faith*, a religious pamphlet series. Thomas D. Hinton was executive director in 1951. Headquarters: 1312 Massachusetts Ave. N.W., Washington 5, D.C.

Catholic Library Association.—Founded in 1921 as a section of the National Catholic Educational association, it became an independent organization in 1931. Its purpose is to initiate and encourage any movement that will promote Catholic literature and Catholic library work. In March, 1951 the 25th annual conference was held in Chicago, Ill. Membership in 1951 was about 1,900. Publications: *1951 Catholic Supplement to the Standard Catalog for High School Libraries; Catholic Periodical Index; Catholic Booklist.* Officers (1951): John M. O'Loughlin, president; Helen L. Butler, vice-president; Laurence A. Leavey, executive secretary, at the national headquarters address: P.O. Box 25, Kingsbridge Station, New York 63, N.Y.

Catholic Organizations for Youth.—Organized on diocesan and national levels, this organization's central co-ordinating agency is the youth department of the National Catholic Welfare conference. The purpose of the Catholic youth organizations is the fostering of the spiritual welfare of young people through religious, cultural, social and athletic activities. Organizations connected with the diocesan section by affiliation are the Columbian Squires, the Junior Catholic Daughters of America, the Young Christian Workers, the Daughters of Isabella and the Sodality of Our Lady. In 1951 the diocesan section was raised to the national level by the formation of the National Federation of Diocesan Catholic Youth Councils; this organization, the National Federation of Catholic College Students and the National Newman Club Federation formed the National Council of Catholic Youth. The total number of young persons reached by the various programs was estimated in 1951 at about 7,000,000. Diocesan groups and college federations have individual publications, and the youth department of the N.C.W.C. publishes *Newsnotes*, a monthly with material of interest to diocesan youth directors; *Program Service*, for parish youth directors; a *Catholic Youth Directory;* and pamphlets. Msgr. Joseph E. Schieder was N.C.W.C. youth department director in 1951. Headquarters: 1312 Massachusetts Ave. N.W., Washington 5, D.C.

Catholic Rural Life Conference, National.—This organization was founded in 1923 to care for underprivileged Catholics in farming areas and encourage Catholics to settle and remain on the land. During 1951 it endorsed "suitably organized" international migration to less populous countries and democratically organized co-operatives and land reform measures. *Christian Farmer*, monthly, is the organization's publication. Its president in 1951 was Bishop Albert R. Zuroweste of Belleville, Ill., and its executive secretary was Msgr. L. G. Ligutti. Headquarters: 3801 Grand Ave., Des Moines, Ia.

Catholic Welfare Conference, National.—This organization was founded in 1919 to organize and co-ordinate the Catholic residents of the U.S. in works of education, social welfare, immigrant aid and other activities. During 1951 War Relief Services distributed 76,757,786 lb. of relief material valued at $21,892,801 and reported 30,202 persons brought into the U.S. under its auspices. The education department participated in programs involving more than 150 organizations and committees. The social action department conducted two institutes for working women. The monthly publication is *Catholic Action.* Officers (1951): Archbishop Francis P. Keough, Baltimore, Md., chairman; Bishop John F. Noll, Fort Wayne, Ind., secretary. Headquarters: 1312 Massachusetts Ave. N.W., Washington 5, D.C.

Chamber of Commerce of the United States.—A federation of businessmen's organizations, the chamber directed major attention in 1951 to ways for strengthening the national economy to meet competing military and civilian demands made upon it under the rearmament program.

The chamber conceived its job to be that of facilitating mobilization while at the same time protecting business against dislocations that would permanently impair the traditional system of unfettered private enterprise. It proposed that every effort be made to make indirect controls a primary weapon against inflation, opposing both direct wage and price controls. It emphasized the need for curbs on reckless government spending, and proposed taxation measures for bringing the federal budget more nearly into balance.

At the annual meeting in May, Dechard A. Hulcy of Dallas, Tex., was elected president of the organization. Arch N. Booth, executive vice-president, was the managing head.

In 1951 the chamber had as members more than 3,200 chambers of commerce and trade associations, which determine policies, and an additional business membership of more than 20,000 business concerns.

Charles Hayden Foundation.—This organization was established in 1937 under the will of Charles Hayden to assist young men to "receive proper training in boyhood and youth . . . in the manner of right and proper living." Its activities are devoted mainly to aiding boys' clubs, boys' camps and similar projects for underprivileged boys, especially those of the New York, N.Y., and Boston, Mass., areas. By Sept. 30, 1951, the foundation had contributed $16,400,000 for these purposes, and there was approximately $58,600,000 in the fund. Officers: J. Willard Hayden, president; Edgar A. Doubleday, executive vice-president and treasurer; Erle V. Daveler, vice-president. Headquarters: 25 Broad St., New York 4, N.Y.

Commonwealth Fund.—Established in 1918 by Mrs. Stephen V. Harkness "to do something for the welfare of mankind," and increased by other bequests, the fund amounted to approximately $80,000,000 at the end of the fiscal year 1950–51. Appropriations for that year were $2,879,383.99. The major concern of the fund in 1951 was helping medical schools to reorient medical education to the student and medical care to the patient, by better integration and increased attention to the relation between the patient and his environment. Grants for medical education amounted to $1,129,282.50; for experimental health services, public health and hospital activities, $679,471.84; and for medical research, $454,768.50. In 1951, 41 men and 1 woman held Commonwealth fund British fellowships for students and civil servants from Great Britain and other parts of the British Commonwealth. The fund publishes an annual report. President, Malcolm P. Aldrich. Headquarters: 1 E. 75th St., New York 21, N.Y.

Daughters of the American Revolution.—The National Society of the Daughters of the American Revolution was founded in 1890 for historical, patriotic and educational purposes. The society in 1951 had 169,633 members in 2,685 chapters. During the year it operated two schools and provided financial assistance to others; conducted programs for good citizenship; operated 11,232 Junior American Citizens clubs with 342,600 members; maintained a genealogical library; and conducted various educational programs of a patriotic nature. Publications: *Daughters of the American Revolution Magazine* and *D.A.R. Manual for Citizenship*. Officers (1951): Mrs. James B. Patton, president general; Mrs. Marguerite Schondau, administrative secretary. Headquarters: 1776 D St. N.W., Washington 6, D.C.

Duke Endowment.—By an indenture executed Dec. 11, 1924, by James B. Duke, the Duke endowment was established as a common-law trust "to make provision in some measure for the needs of mankind along physical, mental and spiritual lines." The fund allocates payments to educational institutions, including Duke university, Durham, N.C., and also distributes funds to help support hospitals, orphanages and the Methodist Church in rural areas. The amount distributed from Dec. 11, 1924, to Dec. 31, 1950, was $90,616,251.26. The fund is supervised by a self-perpetuating board of 15 trustees. Officers (1951) included George G. Allen, chairman; Alex. H. Sands, Jr., secretary; Walter C. Parker, treasurer. Headquarters: Power building, Charlotte 1, N.C.

Elks, Benevolent and Protective Order of.—Founded in 1868, this service organization in 1951 had 1,070,000 members in 1,600 lodges. Its purpose: to practise charity, justice, brotherly love and fidelity; promote the welfare and enhance the happiness of its members; quicken the spirit of American patriotism and cultivate good fellowship. Activities in 1951 included reopening fraternal centres for men and women in the armed services, entertainment for hospitalized veterans, sponsorship of Boy Scout units and the granting of funds for training doctors, nurses and therapy specialists to staff treatment centres for the care of children afflicted with cerebral palsy. Publication: the *Elks Magazine*. Officers (1951): Howard R. Davis, Williamsburg, Pa., grand exalted ruler; J. E. Masters, grand secretary, 2750 Lakeview Ave., Chicago 14, Ill., the national headquarters.

Falk Foundation, Maurice and Laura.—This foundation was established in 1929 with the broad purpose of the advancement of human welfare. In 1951 it explored opportunities for constructive philanthropy in education for citizen participation in practical politics. Grants in 1951 totalled $361,000. Principal appropriations in 1951 included allotments of $75,000 to Brookings institution; $10,000 to the American Law institute; $11,000 to the Committee on Federal Tax Policy; $80,000 to the Alfred P. Sloan foundation; and $15,000 to Fordham university. Publications: *Financing Defense* and *The Transportation Industries, 1889–1946*. Funds as of Dec. 10, 1951, were $11,791,576. Officers (1951): Leon Falk, Jr., chairman; Eugene B. Strassburger, secretary; J. Steele Gow, executive director. Headquarters: 1911 Farmers Bank building, Pittsburgh 22, Pa.

Ford Foundation.—Founded on Jan. 15, 1936, the Ford foundation has as its purpose the receiving and administering of funds for scientific, educational and charitable purposes, all for the public welfare. In 1951 the foundation established the Fund for Advancement of Education, Fund for Adult Education and Free Russia Fund, Inc., and authorized $5,000,000 for overseas activities and $1,200,000 for a television-radio workshop program. Between Jan. 1 and Sept. 1, 1951, grants and authorizations totalled approximately $22,000,000. The total assets of the foundation as of Jan. 1, 1951, amounted to $492,678,255. Officers (1951) included: Henry Ford II, chairman; Paul G. Hoffman, president; Oliver May, secretary-treasurer. Offices: 916 E. Green St., Pasadena, Calif.; 655 Madison Ave., New York 22, N.Y.; Buhl building, Detroit, Mich.

Franklin Institute of the State of Pennsylvania.—This nonprofit institution was founded in 1824 for promotion of the mechanic arts. It devotes itself to interpreting science for nontechnical persons and to research for the benefit of industry and government. Activities include: maintenance of the Benjamin Franklin memorial, a museum of science and industry, including Fels planetarium; a technical library of 131,000 volumes, 46,000 pamphlets and more than 4,000 maps; lectures on a wide variety of subjects; honour awards for distinguished achievements in science and technology; publication of the *Journal of the Franklin Institute;* the Franklin Institute Laboratories for Research and Development; the Bartol foundation; and the Biochemical Research foundation. The National Asphalt Research centre was founded at the Franklin Institute Laboratories for Research and Development during 1951. Income is derived from dues of approximately 6,000 members, museum and planetarium admissions, bequests and gifts and industrial sponsorship of research and exhibits. Officers (1951): Richard T. Nalle, president; Henry B. Allen, executive vice-president and secretary. Headquarters: Benjamin Franklin Parkway at 20th St., Philadelphia 3, Pa.

Freemasonry.—Said to be the oldest and largest fraternal organization in the world, the Masonic fraternity is nonsectarian, nonpolitical and has no benefit or insurance provisions. Its purpose is the moral and spiritual elevation of its members and, through them, of mankind. Since the 18th century its lodges have been joined together in grand lodges, mostly on a territorial basis, each grand lodge being independent. Masonic organizations based on lodge membership include the Royal Arch, the Knights Templar and the Scottish Rite. In 1951 the grand lodges were almost universally concerned with a re-emphasis of Masonic education—the indoctrination of their own members, particularly new members, with the principles and potentialities of the fraternity. Masonic membership in the U.S. in 1951 was 3,651,599 in 15,460 lodges; world membership was in excess of 5,000,000. Publications: annual transactions by all grand lodges and many of the related organizations.

Future Farmers of America.—Founded Nov. 20, 1928, this is a national organization of boys studying vocational agriculture in public secondary schools under the provisions of the national vocational education acts. The chief of the agricultural education service of the U.S. office of education is chairman of an adult national advisory council. The purpose of the Future Farmers is to develop competent, aggressive rural and agricultural leadership; to nurture a love of country life; to help guide those following agricultural vocations; and generally to support scientific farming methods. The 1951 national convention was held Oct. 8–11 at Kansas City, Mo. Membership in 1951 was approximately 340,000. The national adviser (chief adult officer) was W. T. Stanton. Headquarters: U.S. Office of Education, Federal Security Agency, Washington 25, D.C.

Georgia Warm Springs Foundation.—This nonprofit organization was founded on July 28, 1927, to conduct a hospital for the aftertreatment of poliomyelitis and to train physiotherapists for this work. In the fiscal year ending Sept. 30, 1951, 998 patients were treated. It has no endowment, its annual deficit being financed by appropriations from the National Foundation for Infantile Paralysis. Publications include annual reports and medical articles of the professional staff. Officers (1951): Basil O'Connor, president and treasurer; Henry K. Urion, executive vice-president and counsel; William F. Snyder, vice-president and secretary. Headquarters: 120 Broadway, New York 5, N.Y.

Girl Scouts of the United States of America.—Founded in 1912 by Juliette Low, this organization's purpose "is to help girls realize the ideals of womanhood as a preparation for their responsibilities in the home and as active citizens in the community and in the world." Activities in 1951 included the International Encampment of Girl Guides and Girl Scouts at Camp Wind Mountain, near Stevenson, Wash., July 17–Aug. 6; the All-States Girl Scout camp, first of its kind to be held in the U.S., July 31–Aug. 21; and the 31st National convention, Boston, Mass., Oct. 15–18. During the year Girl Scout units celebrated the 25th anniversary of the Edith Macy school, the national Girl Scout training school. The total membership as of June 30, 1951, was 1,764,682. Publications: *Girl Scout Leader; American Girl; Girl Scout Handbook; A Leader's Guide to the Brownie Scout Program;* and *Senior Girl Scouting*. Officers: Dorothy C. Stratton, national executive director; Mrs. C. Vaughan Ferguson, president; Mrs. Amory Houghton, secretary. Headquarters: 155 E. 44th St., New York 17, N.Y.

International College of Surgeons.—This organization was founded in Geneva, Switz., in 1935 to create a common bond among surgeons of all nations and promote high standards in surgery. In 1951 postgraduate courses, lectures and clinics were held in various parts of the world. Membership was about 8,000. Its publication is *The Journal of the International College of Surgeons*. Officers (1951): Hans Finsterer (Austria), president; Max Thorek, secretary general. Headquarters: 1516 Lake Shore Dr., Chicago 10, Ill.

Jewish Welfare Board, National.—Founded in 1917, this agency is authorized by the U.S. government to serve the religious, welfare and morale needs of Jews in the U.S. armed forces and Veterans administration hospitals. In 1951 it created new local armed services committees; recruited 75 Jewish chaplains; served 135,000 men in the U.S. and overseas; and helped in the reorganization of the United Service organizations (U.S.O.), taking responsibility for 25 clubs. The membership in 1951 included 331 Jewish community centres and Young Men's Hebrew associations with 502,000 members and 40 national affiliated organizations. Officers (1951): Irving Edison, president; S. D. Gershovitz, executive director. Headquarters: 145 E. 32nd St., New York 16, N.Y.

John Simon Guggenheim Memorial Foundation.—Founded in 1925 to improve the quality of education and the practice of the arts and professions in the U.S., to foster research and to provide for the cause of international understanding, the organization during 1951 awarded 194 fellowships with grants totalling $838,500 to citizens of the U.S., Canada, the Latin American republics and the Republic of the Philippines. Endowment: $29,000,000. Officers (1951) included Mrs. Simon Guggenheim, president; Henry Allen Moe, secretary. Headquarters: 551 Fifth Ave., New York 17, N.Y.

Kellogg Foundation.—The W. K. Kellogg foundation was established in 1930 to promote the health, education and welfare of mankind, but principally of children and youth. It functions through these divisions: dentistry, education, medicine and public health, hospitals, nursing and the international division. It is administered by a board of nine trustees, and its assets, Aug. 31, 1951, totalled $61,214,210. Officers (1951): Emory W. Morris, president; Glenn A. Cross, vice-president; Bessie Rogers Young, secretary and treasurer. Headquarters: 250 Champion St., Battle Creek, Mich.

Kiwanis International.—Founded Jan. 21, 1915, in Detroit, Mich., this service organization operates through community Kiwanis clubs, comprised of business and professional men. During 1951 Kiwanis clubs presented on more than 500 radio stations 14 transcribed biographical sketches of leading Americans. It was co-sponsor of the third annual National Kids' day, Sept. 22, and members raised $500,000 to continue youth programs. Clubs provided lunches and milk for 658,473 needy children, sponsored 2,347 activities promoting economy in government and raised $16,385,861 for public welfare campaigns. Membership in 1951 included more than 205,000 in 3,350 clubs of the U.S., Canada, Alaska, Hawaii and the Yukon territory. Publications: *Kiwanis Magazine, Monthly Club Bulletin,* and *The Keynoter*, organ of the Kiwanis-sponsored Key clubs for outstanding high school youths. Officers, 1951–52: Claude B. Hellmann, president; O. E.

Peterson, secretary; Walter J. L. Ray, treasurer. Headquarters: 520 N. Michigan Ave., Chicago 11, Ill.

Knights of Columbus.—This Roman Catholic men's organization was founded in 1882 for the mutual help of its members and to conduct educational, charitable, religious, social, war relief and public relief work. During 1951 the organization continued radio and periodical advertising for the dissemination of religious information. In July it voted to establish the Knights of Columbus Foundation for the Preservation of Historic Documents at the Vatican library. Its membership in 1951 was 805,774. Publication: *Columbia*, a monthly. John E. Swift was supreme knight during 1951 and headquarters were at 45 Wall St., New Haven 7, Conn.

League of Women Voters of the United States.—Founded Feb. 14, 1920, to promote political responsibility through informed and active participation of citizens in government, the membership of this organization in 1951 was 105,000. It operates through state and local leagues, and its 1951 program emphasized support of U.S. mutual security measures and action against inflation. Officers, 1951: Mrs. John G. Lee, president; Mrs. Walter Neale, secretary; Mrs. Bradford L. Patton, treasurer. Headquarters: 1026 17th St. N.W., Washington 6, D.C.

Lions Clubs, International Association of.—Founded in 1917 as a nonpolitical, nonsectarian association of service clubs, the purpose of The International Association of Lions Clubs is to create international good will, promote good citizenship and good government, take an active interest in community welfare and provide for good fellowship and free discussion. In 1951 individual Lions clubs engaged in activities designed to further these aims, with special emphasis on aid to the blind, community betterment and health and welfare. Membership in 1951 was 425,000. Publication: *The Lion*, monthly. Officers (1951) included Harold P. Nutter, Camden, N.J., president; R. Roy Keaton, Chicago, Ill., director general. Headquarters: 332 S. Michigan Ave., Chicago 4, Ill.

Milbank Memorial Fund.—A membership corporation under the laws of the state of New York, this organization was founded April 3, 1905, to improve the physical, mental and moral condition of humanity and generally to advance charitable and benevolent objects. In 1950 the fund appropriated $478,281.69 to support activities and projects in its field of interest, including $289,800 for grants and fellowships to outside agencies. Total funds (Dec. 31, 1950) amounted to $11,172,785.56. Publication: Milbank Memorial fund *Quarterly*. Officers (1951): Morris Hadley, president; Frank G. Boudreau, executive director; Catherine A. Doran, secretary. Headquarters: 40 Wall St., New York 5, N.Y.

Music Library Association.—Founded in 1931, this association seeks to promote the establishment and growth of music libraries and collections in the U.S. In 1951 its membership was 850. The association met with the American Library association in Chicago, Ill., during July 1951. Publications: *Notes* and *Supplement to Notes*, both quarterly. Officers (1951) included Edward E. Colby, president; George R. Henderson, secretary. Headquarters: Music division, Library of Congress, Washington 25, D.C.

National Academy of Sciences.—Founded in 1863, by act of congress, the academy's purpose is to advise the government on any subject of science or art; stimulate research in science and its application to national welfare; and promote co-operation in research in the U.S. and internationally. During 1951, it administered research fellowships supported by philanthropic foundations and industry, advised government departments and maintained a large number of committees of civilian scientists for joint study of specific problems. Membership in 1951 was 475; there were 225 members of the National Research Council (founded 1916) and about 3,000 members of committees. Publications: *Proceedings of the National Academy of Sciences;* periodicals; numbered series of technical publications reviewing research. It is endowed by the Carnegie Corporation of New York. Detlev W. Bronk was president of the academy in 1951. William W. Rubey was chairman of the National Research Council. Headquarters: 2101 Constitution Ave. N.W., Washington 25, D.C.

National Association for the Advancement of Colored People.—Founded in 1909, this organization directed its 1951 activities toward abolishing segregation and discrimination in housing, the armed forces, recreation facilities, employment and education. Membership in 1951 was approximately 250,000. Publication: *Crisis* magazine. Officers (1951): Arthur B. Spingarn, president; Walter White, executive secretary. Headquarters: 20 W. 40th St., New York 18, N.Y.

National Association of Manufacturers.—The N.A.M. was founded in 1895 to promote the industrial interests of the U.S., foster domestic and foreign commerce, improve employer-employee relations, protect individual liberty and the rights of employer and employee, and support legislation in furtherance of these principles. Its activities in 1951 were exercised through 13 committees, and included employment relations clinics, vocational guidance forums and the annual Congress of American Industry. Membership in 1951 was approximately 16,500. Publications: *NAM News*, weekly; *NAM Law Digest*, quarterly; and others. Officers (1951) included: William H. Ruffin, president; Earl Bunting, managing director; Noel Sargent, secretary. Headquarters: 14 W. 49th St., New York 20, N.Y.

National Association of State Libraries.—This association was founded in 1889 to provide active co-operation among state libraries and to facilitate the exchange of state laws, court reports and public documents. Its 1951 membership included 46 state libraries. Its national convention was held in Chicago, Ill., in June 1951. Publications include check lists of collected public documents, legislative journals, session laws and statutes. Officers (1951): Roger H. McDonough, New Jersey State library, president; Alfred Decker Keator, Harrisburg, Pa., secretary-treasurer. Headquarters: New Jersey State library, Trenton, N.J.

National Education Association of the United States.—This organization was founded in 1857 "to elevate the character and advance the interests of the teaching profession and to promote the cause of education thruout the country." In preparation for its centennial anniversary in 1957, the 30th representative assembly at San Francisco, Calif., on July 6, 1951, adopted the charter of the Centennial Action program, 1951–57. Progress in the activities of its committees, in public relations, in its work with state and local associations and in the field of standards for the preparation and certification of teachers continued. As of May 31, 1951, the membership was 465,266; membership of affiliated state associations was 880,156. Publications: *NEA Journal* and *Research Bulletin*. Officers (1951–52): J. Cloyd Miller, president; Willard E. Givens, executive secretary. Headquarters: 1201 16th St. N.W., Washington 6, D.C.

National Temperance League, Inc.—This federation of state temperance organizations was formed by the merger in 1950 of the Temperance League of America (formerly the Anti-Saloon League of America) and the National Temperance Movement, Inc. Its purpose is to promote abstinence and to diminish and ultimately eliminate the traffic in alcoholic beverages. The official publication is the *American Issue*. Officers (1951) included: president, Robert G. Lee; secretary, James R. Swedenburg. Headquarters: 131 Independence Ave. S.E., Washington 3, D.C.

Parents and Teachers, National Congress of.—This organization, founded in 1897, had in 1951 a membership of 6,589,516 parents, teachers and other citizens interested in its objectives, organized in about 37,000 individual local associations. Its purpose is to promote the welfare of children; raise the standards of home life; secure laws for care and protection of children and youth; bring the home and school into closer relationship; and develop plans for joint action along these lines by educators and the general public. Activities in 1951 included establishment of a civil defense plan, inauguration of a program to combat illegal drug traffic and sponsorship of other programs dealing with parent-teacher leadership. Publications: the *National Parent-Teacher;* the *P.T.A. Magazine;* the *National Congress Bulletin*. Officers (1951): Mrs. John E. Hayes, national president; Mrs. Edgar F. Dixon, national secretary. National headquarters: 600 S. Michigan Blvd., Chicago 5, Ill.

Research Libraries, Association of.—Founded in 1931, this association of 48 institutions seeks by co-operative effort to develop and increase the resources and usefulness of the research collections in American libraries. Publications include *Doctoral Dissertations Accepted by American Universities* and *Newspapers on Microfilm: A Union Check List*. Charles W. David was executive secretary in 1951, and headquarters were at the University of Pennsylvania library, Philadelphia, Pa.

Rockefeller Foundation.—Founded in 1913 "to promote the well-being of mankind throughout the world," the foundation during 1951 made grants to institutions or agencies such as universities, research institutes or governmental agencies, in the following fields in which its program for the advancement and application of knowledge to human interest was currently concentrated: medical sciences, natural sciences, social sciences, humanities and public health. The 21 trustees are the 21 members of the corporation. Assets, Dec. 31, 1950, totalled $129,379,362. Officers: Chester I. Barnard, president; Edward Robinson, treasurer; Flora M. Rhind, secretary. Headquarters: 49 W. 49th St., New York 20, N.Y.

Rotary International.—Founded Feb. 23, 1905, this organization sponsors a program to encourage and foster the "ideal of service." By 1951, 284 Rotary fellowships for graduate study for one year in foreign countries, ranging from $1,800 to $3,400, had been awarded to students from 42 countries. In 1951 there were 7,400 Rotary clubs with a membership of 350,000 business and professional executives in 83 countries and regions. Publications: the *Rotarian* (English) and *Revista Rotaria* (Spanish), monthly magazine; *Proceedings* of 42nd annual convention; and pamphlets. Officers (1951) included: Frank E. Spain, president; Philip Lovejoy, secretary. Headquarters: 35 E. Wacker Dr., Chicago, Ill.

Russell Sage Foundation.—Established in 1907 by Mrs. Russell Sage for "the improvement of social and living conditions in the U.S.," the foundation's program underwent a revision in 1948 when its library collection, relating chiefly to social work, was divided between the New York School of Social Work and the College of the City of New York. Its later program consisted of varied research and consultation projects, designed to advance the use of the social sciences in the fields of health, education, government and welfare. Publications included *Selection for Parole*, by L. E. Ohlin, and *Social Science and Psychotherapy for Children*, by Otto Pollak. Assets of the foundation, as of Sept. 30, 1951, were $14,150,000. Officers (1951): president, Eli Whitney Debevoise; general director, Donald Young; treasurer, Dave H. Morris, Jr.; secretary, Ralph G. Hurlin. Headquarters: 505 Park Ave., New York 22, N.Y.

Seeing Eye, Inc.—A national philanthropy founded in 1929 and supported through annual memberships, public contributions and bequests. The society's purposes include securing and training dogs to guide blind persons, teaching instructors the technique of training the guide dogs and training the blind in the proper use of their guide dogs. During 1951, 187 blind persons were provided with dog guides. Membership in 1951 was about 20,000; in 1951 more than 1,900 people had received Seeing Eye dogs since the organization's inception. Publications: *The Seeing Eye Guide*, published quarterly for the members of The Seeing Eye, and printed booklets. Officers (1951): Henry A. Colgate, president; James Carey, treasurer; George Werntz, secretary. Headquarters: Morristown, N.J.

Sloan Foundation, Inc., Alfred P.—Founded in 1934, the foundation's primary purpose is the increase and spread of economic knowledge; it also promotes interest in cancer research, primarily through the Sloan-Kettering Institute for Cancer Research of the Memorial Cancer centre in New York city. Economic activities include grants to research organizations and institutions of higher learning and for the production and distribution of radio programs, motion pictures, pamphlets and related material in the field of economics. In 1951 its funds totalled $24,114,126. Officers (1951): Alfred P. Sloan, Jr., president; Arnold J. Zurcher, vice-president and executive director; James F. Kenney, secretary and treasurer. Headquarters: 30 Rockefeller plaza, New York 20, N.Y.

Sodality of Our Lady.—This international Catholic body was founded in 1563 to foster devotion to Mary, the Mother of God. During 1951 eight sodality summer schools of Catholic Action were held with a total attendance of 8,389. U.S. sodalists sent to Pope Pius XII, as a spiritual Christmas gift, offerings of 1,000,021 masses and 841,085 communions. In the U.S., membership in 1951 comprised 16,883 affiliated units with from 6 to 2,000 members in each. Publications include *The Queen's Work*, *Action Now*, *Junior Sodalist* and pamphlets. Officers are a number of priests of the Jesuit order. Headquarters: 3115 S. Grand Blvd., St. Louis 18, Mo.

Twentieth Century Fund.—Founded in 1919 by Edward A. Filene, this is a nonprofit, nonpartisan foundation for research and public education on current economic problems. Activities during 1951 included publication of *Monopoly and Free Enterprise*, *Financing Defense*, *Defense without Inflation* and *Short Selling on the New York Stock Exchange*, and completion of studies of employment and wages in the U.S., the Costa Rican economy and British planning and nationalization, all for publication in 1952. A sound film, *Producing for Defense,* was released for television and nontheatrical use, and a series of radio programs entitled "The People Act" was produced jointly by the fund and the National Broadcasting company. Other projects included studies of national and international economic problems such as agricultural policies in the U.S., antitrust policies and enforcement, government financing, international monetary policy, world needs and resources, U.S. imports, etc. Total assets, Dec. 31, 1950: $9,843,706. Officers: A. A. Berle, Jr., chairman of the board; Francis Biddle, chairman, executive committee; Evans Clark, executive director; J. Frederic Dewhurst, economist. Headquarters: 330 W. 42nd St., New York 18, N.Y.

United States Junior Chamber of Commerce.—This national civic service organization of young men, ages 21 through 35, had in 1951 a membership of approximately 175,000. There were local groups of "Jaycees" in more than 1,900 communities located in the 48 states, Alaska and Hawaii. Activities during 1951 included dedication of a national headquarters building in Tulsa, Okla., and the annual competition for the ten outstanding young men of the U.S. At the national convention in Miami, Fla., in June, the organization adopted a Junior Citizens' crusade, designed to eliminate the causes of juvenile delinquency and to help rehabilitate youthful offenders. Publication: *Future,* monthly. President (1951): Lee Price, Jr., Swainsboro, Ga. Headquarters: 21st and Main Sts., Tulsa, Okla.

Woman's Christian Temperance Union, National.—This organization was founded in 1874 to unite Christian women of the U.S. to rally public sentiment for total abstinence from all alcoholic liquors and to abolish traffic in alcoholic liquors. Membership in 1951 was about 400,000; publications include the *Union Signal* (weekly) and the *Young Crusader* (monthly), for children. During the year the organization continued its comprehensive educational program, distributing literature and educational films and conducting lectures and summer courses for teachers. Officers (1951): Mrs. D. Leigh Colvin, president; Mrs. B. Blanche Butts, corresponding secretary; Mrs. Jonathan B. Cook, treasurer. Headquarters: 1730 Chicago Ave., Evanston, Ill.

Women's Clubs, General Federation of.—Founded in 1890, this organization aims at uniting women's clubs throughout the world to promote education, philanthropy, public welfare, moral values, civics and fine arts. Its 1951 activities included a "Build Freedom with Youth" contest; an international good will program; and campaigns to provide supplies in emergency areas. During the school year 1950–51, 59 students from 27 countries were awarded a total of $30,253. Membership in 1951 included 803,401, with a total in affiliated organizations of about 11,000,000 in the U.S. and a number of other countries. Publication: *General Federation Clubwoman* (monthly). Officers (1951): Mrs. Hiram Cole Houghton, president; Mrs. R. I. C. Prout, treasurer; Mrs. J. L. McCaffrey, recording secretary. Headquarters: 1734 N St. N.W., Washington 6, D.C.

Young Men's Christian Association.—Founded in London, Eng., in 1844, this is a world-wide fellowship seeking to improve the spiritual, social, recreational and physical lives of young people. During 1950 (latest data available in 1951) there were 1,688 Y.M.C.A.s operating in cities and rural areas, with memberships of 2,804,691. More than 149,000 clubs, classes, teams, special-interest groups and councils met regularly with programs emphasizing physical, educational, social and religious features, plus emphasis on citizenship and world affairs. Among high school youth, 9,826 Hi-Y clubs for boys and 2,986 Tri-Hi-Y clubs for girls were functioning. Publications included *National Council Bulletin,* YMCA *Year Book* for 1951 and *History of the YMCA in North America* (1951). Endowments totalled $51,248,000. Officers, 1951: Harper Sibley, president; Eugene E. Barnett, general secretary. The corporate body, the National Board of Y.M.C.A.s, had headquarters at 291 Broadway, New York 7, N.Y.

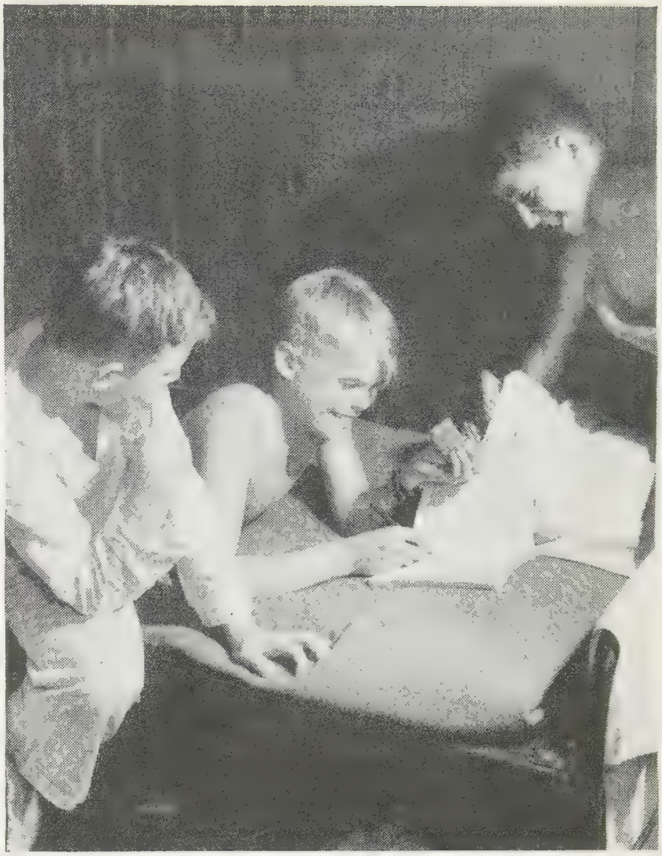
Young Women's Christian Association of the United States of America.—This organization was founded in England in 1855 and in the U.S. in 1858 to build a fellowship of women and girls devoted to the pursuit of Christian ideals in personal and social living. During 1951, 3,000,000 women and girls participated in its activities, which engage women from high school age on. Publications: *The Bookshelf* and *YWCA Magazine.* Officers, 1951: Mrs. Arthur Forrest Anderson, president; Mrs. Roland P. Beattie, treasurer; Mrs. Harrison S. Elliott, general secretary. Headquarters: 600 Lexington Ave., New York 22, N.Y.

Zionist Organization of America.—Founded in 1897, this organization's purpose is to provide assistance to the people of Israel and advance the Jewish cultural renaissance everywhere. During 1951 it sponsored Israel's bond campaign in the U.S.; provided assistance to three youth villages and veterans' organizations in Israel; awarded five Israeli scholarships; and conducted an international essay contest on the relationship between Israel and American Jewry. Membership in 1951 totalled 175,000. Publications: *The American Zionist; The Zionist Quarterly; Dos Yiddishe Folk;* and *Inside Israel.* Officers (1951): Benjamin G. Browdy, president; Sidney Marks, secretary. Headquarters: 41 E. 42nd St., New York 17, N.Y.

Zonta International.—A service organization of executive women in business and the professions, founded in 1919, this organization encourages high ethical business and professional standards, the improvement of the legal, political, economic and professional status of women, and international understanding through a world fellowship of executive women. Membership in 1951 included about 240 clubs with approximately 8,500 members in the U.S. and other countries. Publications: *Zontian* magazine and pamphlets. Officers (1951–52): Elizabeth Gist Dozier, San Fernando, Calif., president; Ellen Fireoved, Chicago, Ill., executive secretary. Headquarters: 59 E. Van Buren St., Chicago 5, Ill.

Sociology.

In 1951 the continuance of the cold war and the Korean war seemed to have accelerated, in the United States, the trend toward large-scale research. Funds in considerable amount became available for social-psychological, sociological and related investigation. The department of defense in its various branches let numerous contracts, the Rand corporation (an air force device for avoiding red tape) continued its "brain trust" program, the central intelligence agency almost certainly had, under tight security, an extensive research setup, and the department of state did a great deal of high quality work under severe handicap. Field workers were sent to many areas at home and overseas by some of these agencies to deal with problems such as how to avoid friction between U.S. forces abroad and the indigenous population. Lecturers from the universities were called in to work along lines reminiscent of the foreign area and language study curriculum and the civil affairs training program of World War II. The Point Four program, in which the department of agriculture played a large part, enlisted the research and field work services of many rural sociologists.



BUNKMATES at an international children's village set up near Cincinnati, O., in 1951. The children's interrelations and their diaries were used as research material by a staff of sociologists and psychologists headed by D. T. Allen, psychologist at the University of Cincinnati

All in all, government seemed to be sponsoring, supervising or conducting general social-scientific research on a large scale, and the various specialties in the science of social relations came in for a good share of attention. Most of the work was done by teams or at least by co-ordinated personnel, and was almost always anonymous and under security classification.

The private foundations, large and small, likewise fostered large-scale research. Some of them, notably the Ford foundation, gave support to programs aimed not at specific researches but at genuinely basic considerations. Large grants to individual researchers who then recruited assistants were also made, but not in most cases by the more conventional foundations.

The universities also showed signs of favouring large-scale research, especially on interdepartmental and teamwork bases. This was sometimes partially supported by the taking of contracts to do work for private concerns—advertising agencies, television and radio sponsors, industrial organizations and so on. Over and above this, however, appeared the increasing practice of giving release from teaching and committee duties in order to do research, and also the establishment of full-time research professorships.

Research of the small-scale type, much of it carried out by individuals, continued to be of importance although relatively less prominent. Fulbright appointments, Social Science Research council grants (especially for area training and investigation), university sabbaticals, special research leaves, reduced teaching schedules, provision for research assistants, Carnegie support, and self-financed projects accounted for a considerable flow of basic and applied work.

Many men who would have chafed under even the mild regimentation that some large-scale projects involved were thus enabled to make important contributions, more especially when the projects they undertook did not lend themselves to the use of standardized methods or techniques.

The teaching function of the social scientist also received recognition from government agencies. For example, the department of state brought in sociological and anthropological specialists for its summer and other staff courses, the air force college at Maxwell field, Ala., made use of social-science-trained lecturers on both permanent and visiting bases, the central intelligence agency had men on leave or "on career" who taught ordinary academic subjects with the special slant that the needs of the agency required, and the Pentagon not infrequently utilized academic consultants in a teaching capacity.

In the colleges and universities the teaching of this or that branch of the science of social relations at both undergraduate and graduate levels still took up the greater part of the time of most staff members of those branches.

Sociological and allied publication continued on its accustomed way. The usual flock of elementary textbooks made its appearance, but was peppered by the telling shots of A. H. Hobbs, whose *Claims of Sociology* (1951) showed clearly how much quoting of textbooks by other textbooks, and so on, was going on, and how flimsy some of the most widely accepted textbook generalizations were. The best textbook of the year, however, Don Martindale's and E. D. Monachesi's *Elements of Sociology* (1951) was not as vulnerable as others.

There was a continuance of the translation vogue with at least one worth-while result, H. H. Gerth's work on Max Weber's *The Religion of China* (1951).

Among important treatises published were Talcott Parsons' *The Social System* (1951) and a symposium edited by Parsons and E. A. Shils, *Toward a General Theory of Action* (1951). It was too early to assess the ultimate significance of these works, but it already seemed clear that they would call forth much comment. The careful student could readily determine where most of the theoretical insights came from by reading Howard W. Odum's *American Sociology* (1951) and Howard Becker's and Harry Elmer Barnes' *Social Thought from Lore to Science* (2nd ed., 1951).

In Great Britain there was a sound stress on field work and similar kinds of empirical research. At Birmingham there had already appeared an impressive research publication following a social-cartographic method that bore the title, reminiscent of Patrick Geddes, of *Conurbation;* North Americans would have classified it as urban sociology or human ecology. A survey of Banbury, with primary reference to neighbourhood and similar clusterings, was in full swing, and a somewhat similar survey of Coventry was well advanced. Liverpool researchers were working on the sociology of housing. At Edinburgh the department of anthropology was carrying on studies in remote Scottish parishes, small villages, and among minority groups that were essentially sociological. In the Institute of Agricultural Economics at Oxford researches were proceeding in the field of rural sociology.

The Tavistock Institute of Human Relations was doing studies along "group dynamics" lines, with heavy injections of psychoanalysis, labour economics and measurement techniques.

Outside the British universities and institutes there was some good sociological work that did not bear that label. Researches of social-science amateurs were often published in small local journals of high quality. County books and similar publications dealing with manners, customs and social institutions of all sorts abounded in the bookshops. Studies of regional characteristics in personality and culture were numerous. Signs of progress were clearly apparent, particularly in the pages of the important new periodical, the *British Journal of Sociology.*

In France the break with the period prior to World War II was not so strikingly evident as it was in Britain and in the United States. There was no notable increase in the number of students of sociology or of professorial posts.

Important French research centres were the École Pratique des Hautes-Études and the Centre d'Études Sociologiques (the latter a part of the Centre National de la Récherche Scientifique). Books and articles of significance were published by Georges Friedmann, Paul Maucorps, Georges Gurvitch, Roger Bastide and Marcel Mauss, and there appeared posthumously Maurice Halbwachs' *La Mémoire collective.*

Germany was slowly recovering from the nazi blight and the postwar confusion, but there was a deplorable dearth of younger men in important posts. Few chairs of sociology had been established; those that existed were occupied by men who were primarily philosophers, historians, journalists, or would-be political figures. At the same time, good research institutes granting some place to sociology were to be found at Frankfurt, Münster, Marburg, Giessen, Hanover, Darmstadt and Göttingen, to name only a few. The number of younger men who were sent abroad for sociological training was considerable. During the year, an imposing *Festschrift* was published in honour of Leopold von Wiese on his 75th birthday, with contributions by sociologists from all over the world.

FILMS OF 1951.—*Ages and Stages Series* (2 films) (McGraw-Hill Book Co., Text-Film Department); *Discussion Problems: Other People's Property, Discussion Problems: The Other Fellow's Feelings, Discussion Problems: The Outsider* (Young America Films, Inc.); *Going Steady, Heredity and Environment, How Friendly Are You? Sodality of Our Lady: *see* SOCIETIES AND ASSOCIATIONS, U.S.

Softball. The Dow Chemical Company nine at Midland, Mich., provided a thrilling finish for the 1951 world championships of the Amateur Softball association held at Detroit, Mich., when it came back from defeat to topple the Clearwater, Fla., Bombers, the defending titleholders. After losing to the Southerners, 3–1, earlier in the competition, the Dow team blanked Clearwater by 4–0 in the final round to force a playoff for the crown. John Skolnicki, who had held the Bombers to 3 hits in the last round contest, was called upon again in the deciding battle and he was in top form, allowing only 2 safeties.

Two California teams met in the title contest of the women's division and the honours went to the Orange Lionettes for the second year in a row when they set back the Fresno Rockets, 2–1, for their fifth victory in five tournament games. Behind the 7-hit twirling of Bertha Ragan, the Lionettes won in the 20th inning on a walk, a wild pitch and a single by Pat Collins.

(T. V. H.)

Soil Erosion and Soil Conservation. A significant trend noted during 1951 was the incorporation of soil and water conservation into programs designed specifically to improve conditions in underdeveloped countries. It was becoming apparent in most of these countries that better living conditions could not be achieved without increased agricultural production. And, fortunately, nearly everywhere there were at least a few agriculturists, holding positions of importance and trained in modern conservation methods, who could advocate care and improvement of the soil as a primary factor essential to greater yields of food and forage crops.

The Food and Agriculture organization of the United Nations was assisting in the spread of conservation methods to the needy nations. Other United Nations organizations gave impetus to the movement by setting up educational programs, such as the pilot projects of U.N.E.S.C.O. and stressing soil and water conservation as an important feature of educational activities for backward communities. These projects were proving especially valuable in some of the Latin-American countries. At the same time, a number of conservation technicians were dispatched into underdeveloped areas through the Point Four program, or through the Economic Co-operation administration, where funds were made available to assist worthwhile soil conservation programs already in operation.

The soil conservation service of the U.S. department of agriculture continued to train conservationists on a worldwide basis for the benefit of food production in general. By Nov. 1951, nearly 1,000 agricultural scientists or technicians had visited the United States from 90 nations, colonies or protectorates, to study soil conservation with the soil conservation service. About 200 of them had spent a year or more learning soil and water conservation in all its phases.

Some of the underdeveloped nations or colonies reporting benefits in the form of better food production from soil conservation were: the Belgian Congo, Algeria, Nigeria, Uganda, Tanganyika, Kenya, Nyasaland, Haiti, Guatemala and El Salvador.

In Europe there was a significant acceleration in planning and organizing for modern soil conservation as a basis for increasing food production to provide better nutrition in small countries with dense populations. Soil conservation work was started in Spain, Portugal, Switzerland, Austria, Germany and France. About 250 agricultural specialists from European countries, including Iceland, Great Britain and the Azores visited the United States to observe and study soil and water conservation methods applied on farm land.

Some of the technical problems encountered during the year were the restocking of derelict woodlands and the reclamation of land devastated by open-cast mining in Great Britain; water spreading and flood control methods adaptable to barren lands slated for reclamation in India; and suitable water spreading methods for the great plains of the United States, and parts of Australia and India. Special studies were being conducted in all these regions to devise the least expensive and permanently effective ways of solving such problems.

United States.—During 1951 there were several significant advances in soil and water conservation. The field of the work on the land broadened considerably as farmers and ranchers organized more than 80 new soil conservation districts including nearly 55,000,000 ac. and 100,471 farms. By Nov. 1, 1951, 2,412 such districts had been formed in the 48 states and in Alaska, Hawaii, Puerto Rico and the Virgin Islands. They covered approximately 1,333,000,000 ac. and included 4,929,464 farms and ranches. Technicians of the soil conservation service were located in all but 51 of the districts, helping farmers to plan their farms and to apply soil and water conservation methods to their land. Ten states and two territories were completely covered by the districts: Alabama, South Carolina, Delaware, Rhode Island, New Hampshire, Vermont, New Jersey, Massachusetts, Nebraska, Mississippi, and Puerto Rico and the Virgin Islands.

RECLAIMING LAND from the Zuider Zee to increase Dutch acreage, a project being financed in 1951 with the help of Marshall plan funds. Sand-laden water is shown being poured over a rising dike to leave a deposit of sand (rear) when the water drains off

The soil conservation districts, organized under state laws and functioning as local units of state governments, were proving the most important feature of the national soil and water conservation program. The primary aim of all districts is to apply needed soil and water conservation measures and to maintain the land for high production of agricultural products. The districts were especially effective during 1950–51 in gaining the interest and support of state and local agencies and institutions in soil conservation.

All state experiment stations continued to co-operate with the soil conservation service in soil and water conservation research, while many state nurseries assisted by producing seed and planting materials for erosion control plantings in the districts. The state legislatures were appropriating directly, on an annual basis, between $4,000,000 and $5,000,000 for use by the districts. In addition, many local government agencies, as well as civic and business groups, were contributing valuable aid in the form of technical assistance, benefit or incentive payments and grants, or materials and equipment needed by the districts for conservation works benefiting the communities.

As of July 1, 1951, 18,542 private contractors were engaged in soil conservation work in the districts. More than 50,000 pieces of heavy equipment were being used, including wheeled and crawler tractors, draglines, power shovels, ditching machines, well drillers, bulldozers, pickup scrapers, and others.

A working method developed by soil conservation service technicians and farmer supervisors of soil conservation districts, known as neighbour group action, was effective in speeding conservation work in many communities during 1950 and 1951. By this method, natural neighbourhood groups, bound by common interests and daily living, planned and worked together, with the technicians' assistance, to spread soil and water conservation within their farm communities. They made conservation plans of the whole communities, loaned one another machinery and seed, assisted each other in laying out terracing and strip cropping, formed working parties to build ponds and diversions, and co-operated in conservation work in many other ways.

The soil conservation service was providing technical assistance to nearly 26,000 such groups during 1951. About 16,500 additional groups had been identified and many had started this type of neighbourhood co-operation within soil conservation districts. The method was proving effective in speeding up the planning and application of conservation plans and methods, and in many instances it appeared that the work was more efficient.

Considerable attention was given by the soil conservation service to effective and inexpensive ways to maintain soil and water conservation practices in good working condition after they were applied. Nearly 150,000,000 ac. of farm and ranch land had been completely treated for erosion control and conservation use, and farmers were keenly interested in maintenance. Application of conservation plans was in progress on an additional 110,000,000 ac., so that the problem of maintenance was important to operators whose land totalled about 260,000,000 ac. All of this land was in use for production of food, livestock feed, and other crops necessary to the nation's economy.

Complete conservation farm plans had been prepared for more than 1,000,000 farms including 275,116,000 ac. by the end of the 1951 fiscal year. Conservation surveys had been completed on 375,300,000 ac.

Substantial progress was made in range conservation in 1951. Ranchers showed increased interest in conservation, and new soil conservation districts were formed in the range country. Conservation management plans were applied on 11,000,000 ac. of range, making a total of about 70,000,000 ac. that had been put under conservation treatment by July 1, 1951. Nearly 10,000,000 ac. of pasture and range seeding had been completed. Studies made of livestock production on ranges which were in poor condition, and those in good condition after conservation treatment, showed an average increase of 60% in pounds of beef per acre on the conservation treated ranges.

On Feb. 15, 1951, the secretary of agriculture designated the basic objective toward which all soil conservation activities of the department of agriculture were to be directed. The objective read: "The basic physical objective of soil conservation activities by Department agencies shall be the use of each acre of agricultural land within its capabilities and the treatment of each acre of agricultural land in accordance with its needs for protection and improvement." The secretary directed that co-ordinating activities be carried out between the soil conservation service, the agricultural conservation program of the Production and Marketing administration, the forest service and other agencies concerned with conservation.

Considerable progress was made in this co-ordinating program during the latter half of 1951. Under the new directive the soil conservation service became responsible for all technical phases of soil conservation work undertaken by the Production and Marketing administration in state and county programs and for giving technical assistance to farmer participants in the agricultural conservation program. The Production and Marketing administration continued to be responsible for payments for conservation practices, and the forest service and soil conservation service were directed to work closely together to improve farm woodlands and help farmers establish sustained yield woodland practices as part of their conservation farming plans.

World-Wide Developments.—Almost all organized nations, colonies or protectorates had taken steps toward conservation of soil and water resources by the end of 1951. Some of the year's developments which appeared promising were as follows:

A soil and water survey was started early in the year in Libya, North Africa, with funds alloted under the United States Point Four program. At the same time, an agricultural education program, including simple soil conservation methods, was launched in Eritrea. Programs already in operation in Algeria and the Sudan were stressing wind erosion control in flat lands, and attempting to develop sound practices to save all rain water falling in highlands.

In Pakistan a central soil conservation organization was established to conserve soil and water resources by extending sound land use practices and reducing hazards of floods and siltation. Intensified research was launched, including five new research stations in Baluchistan, North-West Frontier Province, Sind, Punjab and east Pakistan, in order to develop erosion control practices under local conditions. A survey had shown that soil erosion and waterlogging were putting about 200,000 ac. of land out of use every year and reducing fertility of other lands. Intensive research was said to be required to find remedies for Pakistan's waterlogged areas.

The Israeli Soil Conservation department established a large nursery for erosion control grasses and legumes at Migdal Got during 1951. Much of the area was seeded to a variety of grasses, which were to be studied to determine those best adapted to erosion control and grazing throughout the country.

A National Soil Conservation act was passed by the congress of the Philippines in May and approved by Pres. Elpidio Quirino in June 1951. The act established the Bureau of Soil Conservation, under executive control and supervision of the Philippine Department of Agriculture and Natural Resources. The new bureau absorbed all divisions, sections and field activities and agencies of the government theretofore connected with soils and conservation work. It was authorized to make erosion studies and surveys, establish conservation demonstrations, and carry on an active program of assistance to soil-conserving farmers. Four regional areas with field headquarters already had been established, and soil conservation tillage, sedimentation control and soil fertility demonstrations were under way.

In the Union of South Africa, 408 soil conservation districts, covering 118,390,000 ac. and including 46,393 farms, had been formed by the beginning of 1951. District committees were functioning in 298 of the districts, and soil conservation technicians were at work with farmers in 150 of them. In addition, seven conservation areas, covering about 4,400,000 ac. of critically eroded land, were being treated with gully control, cover cropping, regrassing, and reforestation methods adapted to the different conditions. The total area in the districts and the conservation areas represented about half the land farmed by Europeans in the Union. It mainly included, however, areas devoted to pastoral farming, that is, ranching and production of wool and mutton. Arable farms were proving much slower in becoming part of the soil and water conservation program. In May, officials of the Union's Division of Soil Conservation began assisting South West African farmers and farm organizations, upon request, in the formation of a soil and water conservation program for that country.

A soil conservation committee of five agricultural technicians was appointed by the minister of agriculture of Portugal in June 1951 to develop a soil and water conservation program for that country including the Madeira Islands. All of them were sent to the United States to study with the U.S. soil conservation service, as a first step in planning the Portugal program. In France, also, a new technical section to conduct research with special reference to soil conservation, irrigation and drainage problems, and to aid in development of conservation education, was set up and staffed within the ministry of agriculture's office of rural engineering. The newly organized staff visited the United States for study and observation during the summer of 1951. (*See* also AQUEDUCTS; DAMS; FORESTS; IRRIGATION.)

FILMS OF 1951.—*Earth, Erosion* (Gateway Productions, Inc.). (H. H. BE.)

Solar System: *see* ASTRONOMY.

Solomon Islands: *see* PACIFIC ISLANDS, BRITISH; TRUST TERRITORIES.

Somaliland, British: *see* BRITISH EAST AFRICA.

Somaliland, French.

This former colony situated in the Gulf of Aden, the status of which was changed in 1946 to that of overseas territory, is bounded north by Eritrea, west and south by Ethiopia and southeast by British Somaliland. Area: 8,376 sq.mi. Pop.: (1936 census) 46,391; (1950 est.) 60,000. Natives included 21,000 Danakils, 15,700 Somalis and 5,600 Arabs; Europeans 2,000, including 1,260 French. Capital: Jibuti (pop., 1949 est., 22,000). Governor: Numa Sadoul.

History.—In the elections of June 17, 1951, for the national assembly in Paris, the deputy going out, a Socialist, was replaced by a Gaullist. Work on the port and on the street plan of Jibuti was continued. Steps were taken toward establishing centres of cultivation in the hinterland, with a view to settling nomads. The new local assembly, based on a better distribution of seats among the various peoples, seemed to have given satisfaction. There were no reports of disturbances.

Education.—Schools (1950): primary 7, pupils 870.

Foreign Trade.—(1950): Imports 2,720,000,000 Jibuti fr.; exports 1,383,000,000 Jibuti fr. (coffee treated on the spot and re-exported, 963,000,000 Jibuti fr.; sea salt 91,000,000 Jibuti fr.).

Transport and Communications.—(1950) Roads 400 km.; motor vehicles 500. Traffic handled by the port of Jibuti 460,000 metric tons.

Finance.—Budget (1951 est.): balanced at 539,000,000 Jibuti fr. Jubuti franc = 1.64 metropolitan francs = .466 U.S. cents. (HU. DE.)

Somaliland, Italian.

This is an Italian trust territory (former colony) in east Africa, bounded southeast by the Indian ocean, west by Kenya and northwest by British Somaliland and Ethiopia. Area: 198,000 sq.mi. Pop. (1949 est.): 971,879 (incl. 2,985 Italians). Capital, Mogadishu (pop. *c.* 74,000). Administrator, Giovanni Fornari.

History.—The year 1951 was the first full year of trust administration designed to lead the territory to independent sovereign status within ten years. Italy, the administering authority, prepared machinery and plans to achieve this ideal. Activities were mainly concerned with picking up the threads of administration severed by a nine-year British interlude. By Somali standards the country was peaceful during the year.

Constitutional progress was initiated by the formation of a council, nominated by the administrator. It consisted of representatives of all the main interests and of provincial and municipal councils. These bodies had been given advisory powers only. An administrative school was opened in Mogadishu to train selected Somalis as future governing elements. The advisory council for the trusteeship administration of the United Nations consisting of representatives of three member states continued to function during the year. The Somali Youth league, which had strenuously opposed the re-entry of Italy to the colony, extended reluctant co-operation to the administration, but their spokesmen outside the territory continued to complain in petitions to the U.N. Trusteeship council of victimization.

The report by Italy was examined by the Trusteeship council in July, and received a favourable, although not uncritical, reception. It emphasized the country's economic instability, the need for capital investment to develop its scanty resources and the political immaturity of the people. (*See* also TRUST TERRITORIES.) (F. E. ST.)

Education.—Schools (1951): 68 elementary (6,892 pupils); 11 secondary (550 pupils). School of administration, 37 pupils.

Finance and Trade.—Currency: somalo (one somalo = Italian L.87.50, U.S.$1 = 7.14 somali). Budget 1950–51: revenue 55,907,454 somali, including grant-in-aid from Italy 30,527,324 somali; expenditure 55,907,454 somali. Foreign trade (April 1–Dec. 31, 1950): imports 43,632,289 somali; exports 18,816,107 somali. Principal exports (April 1–Dec. 31, 1950): bananas 5,504,447 somali, cotton 2,139,351 somali, hides 4,928,583 somali.

South Africa, British: *see* BRITISH SOUTH AFRICAN PROTECTORATES.

South Africa, The Union of.

A self-governing member of the Commonwealth of Nations, the Union of South Africa extends from the southernmost point of the African continent to the Limpopo river in the north. The mandated territory of South-West Africa is administered by South Africa. (*See* also TRUST TERRITORIES.)

Province	Area (sq. mi.)	Population (1951 census*)	Capital (pop., 1951 census)
Cape of Good Hope. . . .	277,113†	4,417,330	Capetown (571,638)
Natal	35,284	2,408,433	Pietermaritzberg (74,399)

Total, Union of South Africa	472,494	12,646,375	
South-West Africa.	317,725	430,354	Windhoek (1946 census, 14,933)

*Revised preliminary figures.

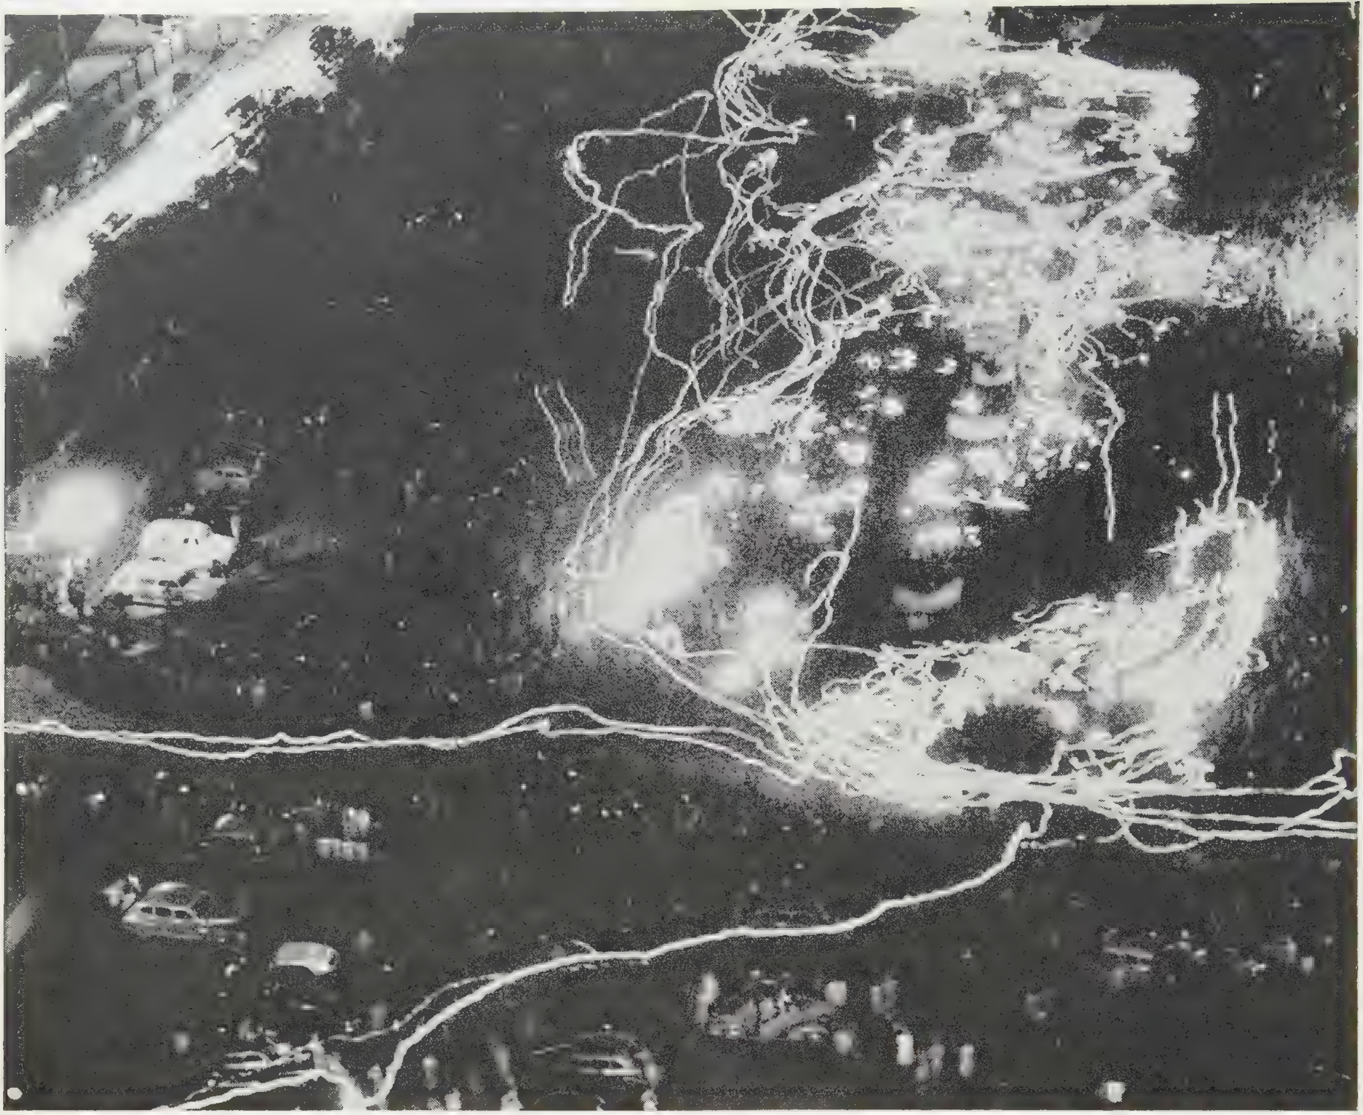
†Including Walvis Bay (430 sq.mi.; pop., 1946 census, 2,270) administered with South-West Africa.

The population of the Union included: European 2,643,187; Bantu 8,535,341; coloured (mixed) 1,038,766; Asian 365,524; Cape Malays 63,557. South-West Africa: European 49,641; African 380,686; Malay 16; Asians 11. Languages: official languages (1946 census, Europeans only), 69% spoke Afrikaans and English, 17% English only, 14% Afrikaans only; Africans, generally Bantu. Religions: (Europeans, 1946 census) Dutch Reformed Church 55%, Anglican 19%, Methodist 6%, Presbyterian 5%, Roman Catholic 5%, Jewish 4%, other 6%; (non-Europeans) 51% Christian.

Capetown is the seat of the legislature and Pretoria the seat of government. Other principal towns (total pop. and European pop., 1951 census) are: Johannesburg (880,014; 359,539); Durban (475,026; 148,980); Port Elizabeth (187,071; 78,315); Germiston (149,982; 65,854); East London (90,695; 43,668); Springs (115,880; 31,389); Governor general: Ernest George Jansen; prime minister and minister of external affairs in 1951: Daniel François Malan.

History.—A. J. Stals, minister of health and social welfare, who died in Feb. 1951, was replaced both in the cabinet and in parliament by Karl Bremer, who easily held the seat for the Nationalists at the by-election in Ceres. An important political development was the amalgamation of the two government parties, the small Afrikaner party led by N. C. Havenga and the Nationalist party led by Malan. A new Nationalist party was formally constituted with a somewhat broader program of general principles, and the prohibition against Jews as members of the Transvaal Nationalist party was lifted.

The work of the parliamentary session was overshadowed by the contentious Separate Representation of Voters act which transferred about 50,000 Cape coloured (mixed race) voters from the common electoral roll to a special roll. These voters would in future elect four Europeans to represent them in the house of assembly and two persons to the Cape provincial council. One senator would be nominated by the government to represent them in the senate. After hearing arguments from both sides, the speaker ruled that under the constitution a two-thirds majority was not required for the passage of the bill, thus con-



TORCHLIT GATHERING in the grand parade square of Capetown, U. of S. Af., called in May 1951 to protest passage of a new franchise bill segregating coloured (mixed race) and white voters at registration

firming the government's view. The opposition, however, contended that good faith, if not strict law, demanded that so momentous a constitutional step should not be taken by a small majority. On May 7 a strike of coloured factory and other workers occurred in Capetown to protest against the bill. The leader of the United party, J. G. N. Strauss, undertook to repeal the act when returned to power and to entrench the coloured franchise as well as other fundamental rights in a bill of rights. The validity of the act was contested in the supreme court, whose decision was awaited at the end of the year.

The act to suppress communism, passed in 1950, was amended to close loopholes. It also provided for the expulsion of Communist members of parliament and of the legislative assembly of South-West Africa at the instance of the minister of justice and with the approval of the house of assembly or the senate. The Bantu Authorities act abolished the Natives' Representative council which had existed since 1936 as a forum for the expression of African opinion. It provided instead for tribal or regional local authorities to be established with due regard for native law and custom and after consultation with the tribe concerned. Other acts defined the future sphere of African workmen in the building trade, regulated merchant shipping and increased the salaries of members of both houses of parliament from £(S.A.)1,000 to £(S.A.)1,400 a year.

A serious disturbance occurred near the end of 1950 in the native reserve of Witzieshoek, in the Orange Free State. There was a clash between 600 Africans and a small police force, as a result of which 14 Africans and 2 European policemen were killed. A commission of inquiry found that the unrest was the result of radical and unpopular changes in tribal agriculture imposed by officials of the native affairs department who had failed to realize how deeply the Africans were disturbed. The enforced culling of cattle was a major grievance. The people in the reserve misunderstood and resented efforts to improve their livestock and to alter their grazing and other rights. The commission recommended that the arable area of the reserve be extended by more than 10,000 ac. and that the needs of landless Africans be provided for.

Another stage was reached in the controversy between the United Nations and the South African government over the future status of the former mandated territory of South-West Africa. A committee of the United Nations submitted a draft agreement providing for a limited degree of international supervision over the administration of the territory. Rejecting this, the government put forward counterproposals involving an agreement with Great Britain, France and the United States as the only remaining members of the group of powers that conferred the original mandate. South Africa was willing to have such an agreement sanctioned by the United Nations, but unwilling to submit annual reports to the United Nations on its administration of the territory. In February Malan, on the occasion of the visit of Patrick Gordon Walker, secretary of state for commonwealth relations, renewed the proposal that the British South African protectorates should be transferred to South African administration. The Union strengthened its defense forces and undertook commitments in respect of joint defense with Great Britain against aggression in the middle east. An agreement was concluded with the United States for the supply of military equipment. (*See* also INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT.)

Education.—State schools (1947): primary 1,190 (European 1,110), pupils 115,368 (European 92,291), teachers 3,927; secondary and high schools 241, pupils 75,339 (European 65,232), teachers 3,122; mission schools 3,031; training institutions 32 (European 9), pupils 3,790 (European 874), teachers 218. Private schools (1947): kindergarten 92; primary 773; secondary 114; commercial and business 19; others 10; pupils at all private schools 73,787 (European 36,500). Technical colleges (1948) 11, students 46,000, teachers 2,150. Universities (1950) 6 and constituent colleges of the University of South Africa 3; total enrolment of students (1948) 23,887.

Finance and Banking.—Budget: (1950–51 actual) revenue £(S.A.)161,500,000, expenditure £(S.A.)156,600,000; (1951–52 est.) revenue £(S.A.)168,400,000, expenditure £(S.A.)182,000,000. National debt (Aug. 1951): £(S.A.)780,600,000. Currency circulation (Aug. 1951): £(S.A.) 79,500,000. Bank deposits (Aug. 1951): £(S.A.)321,700,000. Gold and foreign exchange (Sept. 1951): U.S. $581,000,000. Monetary unit: South African pound, at par with the pound sterling and with an exchange rate (Nov. 1951) of £(S.A.)0.357 to the U.S. dollar.

Foreign Trade.—(1950): imports £(S.A.)307,300,000; exports £(S.A.) 248,200,000. Main sources of imports (1950): U.K. 41.2%; U.S. 16.0%; Canada 4.2%; Iran 3.6%. Main destinations of domestic exports: U.K. 26.0%; France 12.2%; U.S. 8.5%; Southern Rhodesia 7.4%. Main imports: metals, metal manufactures, machinery and vehicles 33%; textiles and clothing 22%; petroleum and products 9%. Main exports, excluding gold and bullion: wool 25%; semiprocessed and processed gold 15%; diamonds 8%; fruits 4%.

Transport and Communications.—Roads (1950): national 6,000 mi.; provincial main roads 80,715 mi. Licensed motor vehicles (Dec. 1950): cars 466,000, commercial 134,000. Road services (1949–50): passengers conveyed 13,800,000; freight carried 1,754,500 metric tons. Railways (1950): 13,942 mi.; freight 11,570,000,000 ton-mi.; freight carried 39,600,000 metric tons. Shipping (merchant vessels of 100 gross tons and over, July 1950): 156; total tonnage 177,893. Air transport (1950): passenger-miles, 125,000,000; cargo net ton-miles, 4,200,000. Telephones (1950): subscribers 415,518. Radio receiving set licenses (Dec. 1949): 531,300.

Agriculture.—Main crops (metric tons, 1950–51): maize 2,470,000; wheat 680,000; oats (1949–50) 115,000; potatoes 270,000; dry beans 32,000; sugar, raw value 622,000; peanuts 180,000; sunflower seed (1949–50) 21,000; tobacco 19,700; grapes (1949–50) 430,000; oranges and tangerines 204,000. Wine production (1950–51) 2,670,000 hl. Livestock (Aug. 1949): cattle 12,242,000; sheep 31,908,000; goats 5,529,000; pigs 761,000. Meat production (metric tons, 1950): total 430,000, of which beef and veal 307,000, mutton and lamb 74,000, pork 49,000. Dairy production (metric tons, 1950): butter, factory production, 27,100; cheese, factory production, 9,400. Wool production, greasy basis, including Basutoland and South-West Africa (1950–51) 102,000 metric tons. Fisheries: total catch (1949) 125,000 metric tons. Fish oil production (1950) 11,177 metric tons.

Industry.—Industrial establishments (1948–49): 14,361; persons employed 670,000 (Europeans 228,000). Fuel and power (1950): coal 26,064,000 metric tons; electricity 10,872,000,000 kw.hr. Raw materials (metric tons, 1950): iron ore, metal content 1,188,000; pig iron 733,000; steel ingots and castings 816,000; copper, smelter 33,000; chrome ore 496,000; manganese ore 791,000; asbestos 79,300; gold 11,659,000 fine oz.; diamonds 1,926,000 carats; silver 1,134,000 fine oz.; osmiridium 6,450 oz. Cement production (1950): 1,847,000 metric tons.

South Carolina. A south Atlantic state of the United States, eighth of the original 13 to ratify the constitution (1788), South Carolina is known as the "Palmetto state." Area: 31,055 sq.mi. (30,305 sq.mi. land). Population (1950): 2,117,027, an increase of 11.4% over 1940; density: 69.6 per square mile; distribution: 61.1% white, 38.9% nonwhite (almost entirely Negro), 63.3% rural. Capital: Columbia. Chief cities (with populations): Columbia (86,914); Charleston (70,174); Greenville (58,161); Spartanburg (36,795); Rock Hill (24,502); Florence (22,513).

History.—Constitutional amendments abolishing the poll tax as a voting requirement, eliminating separate registration for municipal elections and allowing larger school districts received final ratification by the legislature of 1951. The proposal of Gov. J. F. Byrnes for a referendum on the calling of a constitutional convention for general revision, however, was defeated, as was the recommendation for a state civil service merit system. Two additional plans submitted by the commission on government reorganization also failed to receive legislative approval. But significant laws were passed, at the governor's request, to curb activity of the Ku Klux Klan and to launch a greatly expanded educational program.

The school reorganization law provided a 3% retail sales tax earmarked for education and a long-range expansion program designed to improve and equalize physical facilities for white and Negro schools. It established a state educational finance commission with power to require school district consolidation and other reforms as conditions for its approval of state aid distributed on the basis of $15 annually for each pupil in daily attendance. State bond issues up to $75,000,000 were authorized to finance immediate advances amounting to 75% of the sum due to school districts for the following 20 years.

Impetus to educational reform was given by a nationally publicized suit filed in federal district court by Clarendon county Negroes to end segregation in the schools. Though urging equalization of school facilities, Governor Byrnes announced that South Carolina would abandon the public school system should the court decree nonsegregation. The legislature gave some consideration to meeting such a contingency. In a hearing before a three-judge court at Charleston May 30 Clarendon school officials freely admitted facility inequalities but asked for time to remove them. In a two-to-one decision the court on June 23 upheld segregation but warned that facilities should be equalized and ordered a progress report within six months. An appeal to the U.S. supreme court was pending at the end of 1951.

Chief state officials in 1951 were: J. F. Byrnes, governor; G. B. Timmerman, lieutenant governor; C. F. Thornton, secretary of state; T. C. Callison, attorney general; J. B. Bates, treasurer; E. C. Rhodes, comptroller general; J. T. Anderson, superintendent of education.

Education.—For the year ending June 30, 1951, enrolment in white elementary schools was 193,239, an increase of 2,774; in Negro elementary schools, 187,532, an increase of 661; in white high schools, 84,575, an increase of 2,735; in Negro high schools, 37,744, an increase of 2,755; total white and Negro teachers, respectively, numbered 10,137 and 7,007. State expenditures for current expenses were $34,910,817 for white and $14,392,448 for Negro pupils, the total, $49,303,265, being an increase of $6,592,171.

Social Insurance and Assistance, Public Welfare and Related Programs.—In the year ending June 30, 1951, federal allocation for needy persons totalled $11,146,407, to which the state added $5,076,343. As of June 30, assistance was being given to 43,138 aged, 1,617 blind, 19,493 children, 2,623 totally and permanently disabled and 2,745 persons needing general assistance, a total of 69,616 persons. The total number of cases under care during the year was 76,861. The state employment security trust fund was $53,589,823 on June 30. Payments totalling $6,572,907 went to an estimated 38,300 individuals during the year. Patients in the state hospital for mentally diseased on June 30, 1951, numbered 5,334; in the school for feeble-minded, 1,319; prisoners in the penitentiary, 1,537; in Negro boys' reformatory, 177; in reformatory for white boys, 219; in reformatory for white girls, 96.

Communications.—Paved highway mileage, June 30, 1951, was 13,384; total under state highway department, 22,503; under county highway systems, 26,532. State highway department receipts of $45,331,980 included $22,894,676 from the gasoline tax, total receipts from which were $32,545,945. Railroads measured 3,563 mi. South Carolina ports handled 4,598,564 tons of cargo in 1950. Eastern, Delta, Southern and Southeastern air lines crossed the state.

Banking and Finance.—On June 30, 1951, there were 25 national banks plus 34 branches, 102 state banks plus 14 branches, with capital account, deposits and resources, respectively, as follows: national, $24,075,000, $424,449,000, $452,828,000; state banks and depositories, $21,447,733, $235,668,685, $258,369,829. Resources of the 32 federal building and loan associations totalled $108,096,955; of the 41 state associations, $40,644,997. For the year ending June 30, 1951, the state operated under a general appropriations budget of $108,538,717 and showed a surplus of $389,228; the general appropriations bill for the new year totalled $144,499,437. On June 30 the state debt was $71,090,898 ($71,009,000 being for roads). Federal income taxes totalled $109,248,478; employment and withholding

Table II.—*Value of Principal Industrial Products of South Carolina*

Industry	Year ending June 30, 1951	Year ending June 30, 1950
Textiles (including knitting)	$1,608,984,643	$1,206,433,982
Lumber products (barrels, boxes, baskets, veneering, paper and pulp, furniture, woodwork)	174,506,481	120,636,711
Clothing	68,360,432	50,507,224
Electricity	50,233,303	45,090,928
Fertilizers	36,362,721	31,107,743
Textile supplies	28,588,097	

taxes, $62,943,459; unemployment taxes, $1,473,459. Exports amounted to $78,600,000; imports, $77,600,000; duties on imports, $2,938,652, an increase of more than $400,000 over the previous year.

Agriculture.—The total 1951 value of 21 field and 13 commercial truck crops was $393,535,000, which was 40% above 1950 and 9% above the previous record of 1919. Harvested acreage was 3,998,000, or 2% above 1950. Preliminary estimates showed that cash income from agriculture in 1951 exceeded by about 33% that of 1950, when income from crops was $219,840,000; from livestock, $67,479,000; from government payments, $3,959,000.

Manufacturing.—The value of products manufactured in 1,795 establishments during the year ending June 30, 1951, was $2,230,507,920, an increase of $522,124,291 over 1949–50. Employees numbered 183,596, an increase of 10,634. Total manufacturing capital was $867,285,102, an increase of $91,981,066. (C. E. Cn.)

Table III.—*Mineral Production of South Carolina*

(In short tons)

Mineral	1950		1949	
	Quantity	Value	Quantity	Value

Stone	2,557,510	3,836,056	2,440,540	3,628,596
Other minerals		?		1,456,480
Total		?		$9,026,000

Mineral Production.—Table III shows the tonnage and value of mineral production in the state in 1949 for commodities having values in excess of $100,000, and corresponding data for 1950.

South Dakota.

A north-central state of the United States, admitted as the 40th state on Nov. 2, 1889, South Dakota is popularly known as the "Coyote state." Area: 77,047 sq.mi., of which 511 sq.mi. are water; pop. (1950 census): 652,740 (an increase of 1.5% since 1940), with 436,030 listed as urban; the Indian population in 1945 was 26,432. Capital: Pierre (5,715). Principal cities: Sioux Falls (52,696), Rapid City (25,310), Aberdeen (21,051), Huron (12,788), Watertown (12,699) and Mitchell (12,123).

History.—The legislature convened on Jan. 2, 1951, for a 60-day session. Record appropriations totalling $43,813,931 were authorized and the state gasoline tax was raised from four cents to five cents to provide more revenue for highway construction. The major enactment concerning education provided for school district reorganization through county committees on petition by 10% of the school board members but subject to approval by the voters. The state teachers' retirement system was repealed to enable teachers to participate in the federal social security program. A legislative research council was also provided for.

State officials (all Republican) in 1951 included Sigurd Anderson, governor; Rex Terry, lieutenant governor; Ralph A. Dunham, attorney general; Geraldine Ostroot, secretary of state; Theodore Mehlhaf, treasurer; and Harold S. Freeman, superintendent of public instruction (elected on nonpartisan ballot).

Table I.—*Principal Crops of South Dakota*

Crop	1951	1950	Average 1940–49
Corn, bu.	85,624,000	101,124,000	92,154,000
Wheat, bu.	57,260,000	33,488,000	41,358,000
Oats, bu.	116,365,000	86,086,000	86,060,000
Barley, bu.	19,693,000	18,942,000	32,982,000
Rye, bu.	6,656,000	5,460,000	5,390,000
Flaxseed, bu.	4,584,000	4,527,000	4,168,000
Potatoes, bu.	1,650,000	2,100,000	2,435,000
Hay, all, tons	4,517,000	3,303,000	2,903,000
Soybeans, bu.	870,000	875,000	260,000

Source: U.S. Department of Agriculture.

Education.—The school census, ages 6–20, inclusive, was 159,890 in 1950–51, compared with 159,232 in 1949–50. The enrolment was 90,881 in elementary schools and 29,324 in high schools. Total expenditures were $27,859,456. Average salaries paid were $1,952 for elementary teachers and $2,925 for high school teachers.

Social Insurance and Assistance, Public Welfare and Related Programs.—During the calendar year 1950 the state department of social security distributed $5,820,019 among 12,206 persons in old-age assistance; $2,002,550 to 2,500 families as aid to 6,069 dependent children; and $98,458 for the needs of 223 blind persons. Eight penal and charitable institutions were in operation on a legislative appropriation of $2,749,620.

Unemployment benefit payments during 1950 amounted to $1,122,658 at an average weekly rate of $17.54 to 6,471 individuals. The average total amount received by each individual was $173.54. Readjustment allowances paid to unemployed veterans under the Servicemen's Readjustment act totalled $95,826 in contrast with $863,823 paid to unemployed veterans in 1949. This decrease was attributable to a two-year limit placed on readjustment allowances and was reflected in an increase in the total payments for unemployment benefits.

Communications.—The state in 1951 maintained a highway system of 6,289 mi. including 3,106 mi. of bituminous surface, 401 mi. of concrete pavement, and 2,638 mi. of gravel surface, at a maintenance cost of $4,618,600. There were 3,960 mi. of railroad in operation in 1951. Telephones in use on Jan. 1, 1951, numbered 152,675, of which 41,146 were classified as rural.

Banking and Finance.—There were 35 national banks in operation on Dec. 31, 1950, with total assets of $278,345,000 and total deposits of $262,471,000. The 134 state banks and trust companies on June 30, 1951, had resources of $249,400,553 and deposits of $231,880,542. Eight building and loan associations on June 30, 1951, reported total resources of $6,638,224.

Total receipts for the state treasury for the fiscal year ending June 30, 1951, were $71,689,225; disbursements were $68,087,126. The total bonded indebtedness on Nov. 1, 1951, was $23,965,000, including $11,000,000 of veterans' bonus bonds scheduled to mature July 1, 1953, for which sufficient revenues had already been collected.

Federal internal revenue collections for the fiscal year 1950–51 totalled $64,181,473, of which amount $55,947,728 was derived from the income tax.

Agriculture.—Cash farm income was estimated at $384,056,000 for 1951 and $298,225,000 for 1950. Above-average production totals were forecast for all crops except barley, corn, sorghum and potatoes, with the hay crop the largest on record. Unfavourable planting conditions and early killing frosts resulted in a lower corn yield.

Industry.—In 1947 there were 494 establishments engaged in manufacturing, paying a total of $25,796,000 in salaries and wages to 10,265 employees. The total value added by manufacture was $51,398,000. A total of 645 establishments was reported in 1951. Eight meat-packing plants comprised the largest industry. Creamery and poultry products ranked next in importance. A state-owned cement plant produced 1,001,169 bbl. of cement in 1950. (H. S. S.)

Table II.—*Mineral Production of South Dakota*

(In short tons, except as noted)

Mineral	1950		1949	
	Quantity	Value	Quantity	Value
Clays	205,585	$ 2,207,827	151,341	$ 1,529,542
Feldspar	49,140	249,176	36,145	156,548
Gold (oz.)	567,996	19,879,860	464,650	16,262,750
Sand and gravel	5,392,247	2,750,847	5,456,742	2,315,430
Stone	1,205,910	4,860,858	1,023,710	4,473,432
Other minerals		?		1,985,154
Total		?		$26,722,856

Mineral Production.—Table II shows the tonnage and value of mineral production in the state in 1949 for commodities having values in excess of $100,000, and corresponding data for 1950, so far as they were available at the end of 1951. South Dakota ranks first among the states as a producer of gold.

Soybeans.

The 1951 U.S. soybean crop of 280,512,000 bu. was second only to the record 299,279,000 bu. of 1950, and much larger than the 1940–49 average crop of 178,-

567,000 bu. Planted acreage was 3% less than the 1950 record; 13,211,000 ac. were harvested compared with 13,814,000 ac. in 1950 and 9,348,000 ac. average for 1940–49. An average yield of 21.2 bu. per acre was favourable compared with the 19-bu. average for 1940–49 but lower than the 21.7 bu. of 1950. Early drought in the south, floods in the early growing season in the western area and some late drought in Ohio were handicaps to the crop. Illinois, as usual, produced about one-third (94,562,000 bu.) of the total.

A ceiling price of $3.33 per bushel (at Chicago, Ill.) was put on soybeans early in 1951, after which the price declined about 60 cents per bushel, only to rise about 40 cents per bushel contraseasonally during the harvest period. The average price at the farm was estimated at $2.75 per bushel, compared with $2.47 in 1950. A production goal of 276,000,000 bu. on 13,000,000 ac. was recommended for 1952.

Prospects for U.S. export to Europe and Japan appeared to be somewhat less than the 1,614,000,000 lb. of soybeans and 361,488,000 lb. of soybean oil in 1950–51.

World soybean production in 1951, estimated at 650,040,000 bu. (less than half of it in non-Communist countries), was slightly less than the 653,900,000 bu. of 1950, but almost half again as large as the 463,720,000-bu. annual average before World War II. The 1951 Manchurian crop was estimated to be considerably in excess of 100,000,000 bu., with the likelihood that considerable amounts would be exported. (J. K. R.)

Spain.

A country of southwestern Europe, Spain is bounded north by the Bay of Biscay and France, west by the Atlantic and Portugal and south and east by the Mediterranean. Area: 194,945 sq.mi., including the Balearic (1,936 sq.mi.) and Canary (2,804 sq.mi.) Islands. Pop. (1940 census) 25,877,971; (1950 est.) 28,287,000, including the Balearic (1940 census, 407,497) and Canary (680,294) Islands. Language: mainly Spanish (Castilian); Catalan, Galician and Basque are also spoken. Religion: mainly Roman Catholic. Chief towns (pop., 1947 est. if not otherwise stated): Madrid (cap., 1950 est., 1,609,524); Barcelona (1950 est., 1,205,909); Valencia (562,967); Seville (382,013); Zaragoza or Saragossa (292,965); Málaga (277,582); Murcia (226,702); Bilbao (220,333). Leader (*caudillo*), chief of state and prime minister, Gen. Francisco Franco (*q.v.*).

History.—Asked by Dean Acheson, U.S. secretary of state, in Jan. 1951 whether Spain would be willing, given modern arms, to put forces under Gen. Dwight D. Eisenhower's command, General Franco indicated a preference for direct collaboration with the United States rather than with the North Atlantic Treaty organization. The Spanish ambassador to Washington, D.C., spoke in June of Spain's interest in a military alliance with the United States and in receiving economic aid toward developing vital communications and industries. Reports of such a bilateral pact provoked sharp political reactions in London and Paris, and in western Europe generally suspicions of a U.S. intention to defend the Pyrenees. U.S. senators visiting Spain in July on a mission of inquiry into western defense on behalf of the senate foreign affairs committee were told by General Franco that it would depend on circumstances whether Spain would participate in a general war but that, given the equipment, it could produce an army of 2,000,000 men. Gen. Omar N. Bradley, chairman of the U.S. chiefs of staff, gave 300,000 to 400,000 men as his estimate. Talks held in Madrid in mid-July by Adm. Forrest P. Sherman to discuss the use by U.S. forces of Spanish naval and air bases, in return for military aid, were described by Acheson as "purely exploratory." The "unfriendly attitude" to these conversations shown by Great Britain and France led the Spanish government on July 21 to lodge formal protest with both powers against "these new attempts at interference in a matter which concerns Spain's sovereign right to hold direct relations with another power." A U.S. military survey team representing the three services went to Spain in August to inspect bases. In September it was announced that Spanish officers of infantry and armoured units were being sent to the U.S. for six months' training, and Brig. Gen. Gavado Caballero, military governor of Bilbao, went to Frankfurt, Ger., in October to attend U.S. autumn manoeuvres. Three new destroyers, their armament including three 4-in. guns, were launched in September at Ferrol, where the hulk of the former Italian battleship "Trieste" was taken for conversion into an aircraft carrier. A committee on nuclear energy was set up by the cabinet in October.

SECURITY POLICE lining the streets of midtown Barcelona in March 1951 after a one-day general strike against high food prices, the first serious challenge to the Franco regime since the Spanish Civil War

The decision of Dec. 27, 1950, to exchange ambassadors (José Félix de Lequerica and Stanton Griffis) between Madrid and Washington, after a lapse of five years, was followed early in January by the resumption of full diplomatic relations with Spain by Great Britain and France. Relations were resumed with the Netherlands in January, and instituted with Ethiopia in April, with the German Federal Republic in May, with South Africa in June and with Pakistan in September. In Paris in June the "Basque government-in-exile" was evicted from a building held by a civil court to have been bought (in Feb. 1939) with assets which were the property of the Spanish state. The new British government officially informed Spain on Nov. 7 of its desire to see established more friendly relations between the two countries.

On July 19 General Franco announced the reconstitution of his government after six years. Alberto Martín Artajo (foreign affairs), Blas Pérez González (interior), José Antonio Girón (labour) and Gen. Eduardo González Gallarza (air) retained their portfolios. Four new ministries were created: presidency (designed to relieve General Franco of routine business), Capt. Luis Carrero Blanco; information, Gabriel Arias Salgado; commerce (previously one with industry), Manuel Arburúa; and Falange, Raimundo Fernández Cuesta. The remaining appointments were: army, Gen. Agustín Muñoz Grandes; navy, Adm. Salvador Moreno; justice, Antonio Iturmendi; finance, Francisco Gómez Llano; industry, Joaquín Planell; agriculture, Rafael Cavestany; education, Joaquín Ruiz Jiménez; public works, Count Fernando de Vallellano. Nine ministers in the new cabinet were reported to be monarchists, against six in the old. Earlier, on July 10, the pretender Don Juan had sent a personal letter from Lisbon, Port., to General Franco calling for an immediate restoration of the monarchy and of personal liberties to all Spaniards, and indicating his rejection of any suggestion of a regency with General Franco as regent and Juan Carlos as heir. Prince Xavier de Bourbon-Parma, known as "regent of the Traditionalist communion," arrived from France in November to visit Carlist communities in the Basque provinces, Navarre, Seville and Barcelona.

A one-day general strike in Barcelona on March 12, observed by 300,000 workers, was the first sign of acute and prolonged labour unrest. The government sent a cruiser and three destroyers to the port, and the *Cortes,* meeting on March 12, approved a 30% increase in police pay and one of 20% for civil servants. In April, when Madrid students went on strike, General Franco initiated a series of emergency cabinet meetings to study the country's economic difficulties. A 48-hour strike called in Bilbao and other northern towns for April 23 was observed by 100,000 workers in spite of government threats of dismissal; another strike followed in Pamplona in May. Official statements sought to pin responsibility on separatist and Communist elements working from across the Pyrenees; and of 41 persons arrested in Barcelona in March, 27 were at the end of the year awaiting court-martial on charges of active membership in the banned United Socialist (Communist) party of Catalonia and of issuing clandestine Communist newspapers. New municipal elections, the second since 1939, began on Nov. 25.

Of the U.S. $62,500,000 loan authorized by the U.S. congress in 1950, $10,000,000 was advanced in February and March to buy wheat and cotton; the intention was in the main to exclude consumers' in favour of capital goods, and Washington announced in July the sending to Spain of an economic survey group to study applications for credits. A further $5,600,000 was released in August for hydroelectric and mineral production. Foreign trade agreements were signed with Norway (the first since World War II) in January, with Turkey (providing for the supply by Spain of arms and ammunition) in June and with France in November. Existing agreements with Great Britain were extended to the end of 1951, with some reduction of British exports arising from rearmament. An associate of the Banco Exterior de España, to be known as the Banco Español en Londres, was founded in London in October to help develop trade between the two countries. An adjustable type of railway axle allowing trucks to cross the Franco-Spanish frontier in spite of the difference of gauge came into use in May.

(W. C. An.)

Education.—Schools: primary (1947–48) 55,111, pupils 2,425,762 (1,212,921 girls), teachers 55,833 (30,030 women); secondary (1948–49) 119, pupils 212,210 (74,319 girls); training colleges for elementary teachers (1948–49) 53, students 24,171 (17,575 women). Universities (1948–49) 12, students 49,980 (6,866 women), professors and lecturers 3,300. Illiteracy (1947): 20.8%.

Finance and Banking.—Budget: (1952–53 est.) revenue 22,208,000,000 pesetas, expenditure 22,477,000,000 pesetas. National debt (Sept. 1951): 58,195,000,000 pesetas. Currency circulation (July 1951): 31,600,000,000 pesetas. Bank deposits (March 1951): 38,100,000,000 pesetas. Gold reserve (July 1951): U.S. $61,000,000. Monetary unit: peseta with an official exchange rate (Nov. 1951) of 30.66 pesetas to the pound and 10.95 pesetas to the U.S. dollar.

Foreign Trade.—(Gold pesetas, 1950): imports 1,199,000,000; exports 1,090,000,000. Main sources of imports (1950): Spanish colonies 24%; U.S. 13%; France 8%; western Germany 7%. Main destinations of exports (1950): Spanish colonies 24%; U.S. 15%; U.K. 14%; France 6%. Main imports (Jan.-June 1951): machinery, apparatus and vehicles 16.6%; food and drink 15.5%; chemicals and derivatives 10.6%; textiles 12.7%. Main exports: food and drink 54.7%; textiles 11.2%; minerals, earths and stones 8.4%; metals and metal goods, including gold and silver, 5.2%.

Transport and Communications.—Roads (1949): 68,651 mi., of which 51,202 mi. were macadamized. Licensed motor vehicles (Dec. 1950): cars *c.* 100,000, commercial 65,000. Railways (1950): 11,068 mi., of which 925 mi. were electrified; passenger-miles 4,422,000,000; freight net ton-miles 4,004,000,000; freight carried 25,000,000 metric tons. Shipping (merchant vessels of 100 gross tons and over, July 1950): 1,163; total tonnage 1,192,928. Air transport (1949): aircraft entering Spain 19,426; passengers 234,790; freight 3,576 tons; passengers leaving Spain 249,460; freight 4,070 tons. Telephones (Dec. 1949): subscribers 591,948. Radio receiving sets (1949): 375,635.

Agriculture.—Main crops (metric tons, 1950): wheat 3,380,000; barley 1,500,000; oats 500,000; rye 560,000; maize 620,000; rice, paddy 240,000; sugar, raw value 177,000; potatoes 2,800,000; cotton, ginned, 2,000; tobacco 15,000; groundnuts 12,000; linseed 7,000; olives (1949) 1,924,000; olive oil 194,000; oranges and tangerines 970,000; lemons 43,000. Wine production (1950) 15,680,000 hl. Livestock: cattle (Dec. 1948) 4,000,000 head; horses (Dec. 1949) 600,000; asses (April 1948) 747,000; mules (April 1948) 1,079,000; pigs (April 1948) 2,668,000; sheep (Dec. 1950) 23,000,000; goats (April 1948) 4,222,000; chickens (July 1950) 35,000,000. Meat production (1949) total 110,000 metric tons, of which beef and veal 71,000 and pork 9,000. Wool production, greasy basis (1950) 39,000 metric tons. Index of agricultural production (on basis of 1934–38=100, 1949–50) 90. Fisheries: total catch (1949) 550,000 tons.

Industry.—Fuel and power (1950): coal (metric tons) 11,040,000; lignite 1,344,000; manufactured gas 267,000,000 cu.m.; electricity 6,312,000,000 kw.hr. Raw materials (metric tons, 1950): iron ore, metal content 2,076,000; pig iron 671,000; steel ingots and castings 818,000; copper, black and blister 9,700; lead 34,600; zinc 21,300. Manufactured goods (metric tons, 1950): cement 2,100,000; cotton yarn 57,800; wool yarn 10,000; rayon filament yarn 10,000; rayon staple fibre 14,600. New dwelling units completed (1950): 16,608. Index of industrial production (on basis of 1948=100, 1950): 104.

Spanish Colonial Empire.

Under this heading are grouped the Spanish possessions in Africa. Their total area is approximately 134,715 sq.mi. and the total population (1950 est.) 1,610,000. Areas, populations, capital towns, status and governors of the territories composing the empire are given in the table.

History.—A Franco-Spanish commercial agreement on interzonal trade in Morocco was concluded at Tetuán in March. The Spanish government approved at the same time plans for the utilization of the waters of the river Moulouya to irrigate 15,000 ha. of desert land and to power hydroelectric stations; the project was linked with similar plans in the French zone, and some of the hydraulic installations would be common to both.

Lieut. Gen. José Enrique Varela, high commissioner for Spanish Morocco since 1945 and one of the outstanding Nationalist leaders in the civil war, during which he relieved the Alcázar of Toledo, died in Tetuán on March 24. Lieut. Gen. Rafael García

Spanish Colonial Empire

Country	Area (sq.mi.)	Population (1950 est.)	Capital	Status	Governor
Spanish Morocco					
Northern zone	7,592	1,180,000	Tetuán (pop., 1945, 93,658)	Protectorate	*High commissioner:* Lieut. Gen. Rafael García Valiño y Marcén *Khalif (viceroy of the sultan of Morocco):* Muley Hassan Ismael el Mehedi
Southern zone	10,039	12,000	Cabo Yubi	Protectorate	
Ifni territory	741	43,000	Ifni	Colony	
Ceuta, Melilla, Alhucemas, Chafarinas and Peñón de Velez	82	163,000	—	Administered as part of Spain	—
Spanish Sahara					
Rio de Oro	73,362	37,000	Villa Cisneros	Colony	—
Saguia el Hamra	32,047				
Spanish Guinea . . . . . . including Fernando Po and four small islands	10,852	175,000	Santa Isabel, on Fernando Po (pop., 1945, 17,000)	Colony	—

Valiño y Marcén was appointed his successor.

Four thousand troops, comprising infantry, artillery, cavalry, engineers and the air arm, took part in manoeuvres at Bu Hazchan, near Larache, in October; they were attended by members of the U.S. military mission in Spain. (W. C. An.)

Finance.—Spanish Morocco, budget: (1947) balanced at 211,000,000 gold pesetas. Spanish Guinea, budget: (1943) revenue 23,300,000 pesetas, expenditure 23,600,000 pesetas.

Foreign Trade.—All territories: (1947) imports 526,300,000 gold pesetas, exports 168,200,000 pesetas; (1948) imports 578,400,000 pesetas, exports 206,400,000 pesetas. Ceuta and Melilla only: (1949) imports 123,000,000 pesetas, exports 55,000,000 pesetas; (1950, six months) imports 59,500,000 pesetas, exports 21,200,000 pesetas.

Transport and Communications.—Spanish Morocco: (1947) roads, 1,430 mi.; railways 140 mi. Shipping: (1949) vessels entered, 120,000 net registered tons.

Spanish Literature. Poetry, represented by Fernando Gutiérrez's *Anteo e Isolda* and Dionisio Ridruejo's *En once anos,* was less prominent in 1951 than fiction, though the new Aguilar edition of the poems and plays of Miguel Hernandez gave it distinction. The veteran novelist Concha Espina published *Un Valle enelmar.* Another woman writer, Elena Quiroga, was successful with a Galician novel *Viento del norte.* Successful, too, were Mariano Pombo Angulo's *Sin Patria,* Ramon Ledesma Miranda's *La Casa de la fama* and Francisco Montero Galvache's *El Mar está solo.* A notable play was Claudio de la Torre's *Cortesana.*

In criticism, the year was most fruitful. Dámaso Alonso published a collection of lectures and essays under the title *Poesia española* and (with Carlos Bousoño) *Seis Calas en la expresión literaria española.* The first two volumes appeared of the gigantic *Homenaje* to Menéndez Pidal, who contributed to the Colección Austral its 1000th volume, *El Cid Campeador.* An outstanding historical work was Francisco Elías de Tejador's *Las Doctrinas políticas en la Cataluña medieval.* Joaquin Casalude Casalduero published a new and enlarged edition of his biography of Pérez Galdós. Ricardo Gullón's *Cisne sin lago* was a critical biography of Enrique Gil y Carrasco. E. Correa Calderon edited a volume of selections from *costumbristas* of the 17th to 19th centuries. Esteban Pujolls brought out a substantial study of Espronceda and Byron, and Vicente Garcia de Diego an equally substantial treatise on linguistics. Guillermo Diaz-Plaja published the second volume of his omnibus history of Spanish literature, and José Simón Díaz continued his Hispanic bibliography. Don Francisco Sánchez-Castañer edited a two-volume *Homenaje a Cervantes,* containing the text of a series of lectures delivered by various scholars at the University of Valencia for the quatercentenary of Cervantes' birth.

Of literary reviews, always abundant in Spain, though generally short-lived, *Intus* established itself in Salamanca, *Platero* in Cádiz and *La Calandria* in Barcelona. Notable works published in Catalan included the first volume of Ferran Soldevila's biography of Peter the Great of Aragon-Catalonia and two anthologies, one of 20th-century verse and one of the short story, both by Joan Triadu.

Ciriano Pérez Bustamante was elected to the Academy of History, and the well-known author Don Pedro Lain Entralgo was appointed rector of the University of Madrid. (E. A. P.)

Sports and Games: *see* Angling; Archery; Automobile Racing; Badminton; Baseball; Basketball; Billiards; Bobsledding; Bowling; Boxing; Canasta; Chess; Contract Bridge; Cricket; Curling; Cycling; Fencing; Football; Gliding; Golf; Gymnastics; Handball; Hockey, Field; Hockey, Ice; Horse Racing; Ice Skating; Lacrosse; Lawn Bowling; Motor-Boat Racing; Olympic Games; Polo; Roller Derby; Rowing; Shooting; Skiing; Soccer; Softball; Squash Racquets; Swimming; Table Tennis; Tennis; Track and Field Sports; Wrestling; Yachting.

Squash Racquets. Edward Hahn of Detroit, Mich., kept his national singles title in 1951 when he defeated Henri Salaun of Boston, Mass., former junior tennis champion of Brittany, Fr., 9–15, 15–4, 11–15, 15–12, 15–4, at Chicago. Hahn again was first on the United States ranking list, with Salaun second and Charles Brinton of Philadelphia, Pa., third.

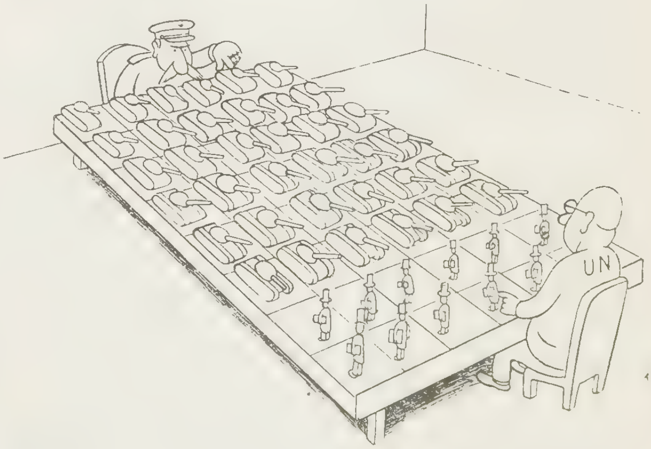
Diehl Mateer and Calvin McCracken, Philadelphia, annexed the doubles title by halting Germain Glidden and Cliff Sutter, New York pair, 18–13, 15–13, 8–15, 15–12. Earlier in the campaign, Hunter Lott, of Philadelphia, and Mateer won the Lockett trophy for the fourth consecutive season when they conquered Brinton and Ned Madeira, their Merion (Pa.) Cricket club teammates, 15–13, 15–8, 15–7.

Jim Tully, Pittsburgh, Pa., regained national professional honours with a victory over Al Ramsay, Cleveland, O., at Philadelphia. Tully won, 15–9, 9–15, 15–7, 2–9 and default when his rival pulled a leg tendon and was forced to quit. W. William LaRoche, Philadelphia, and Allan Cummings, Rye, N.Y. took the pro-amateur doubles crown.

George Waring of Boston was U.S. veterans' king and Henry Foster of Harvard university gained national intercollegiate laurels to help the Crimson racquet swingers annex the team championship.

Jane Austin, Philadelphia, beat Betty Howe Constable, Princeton, N.J., 15–11, 6–15, 15–12, 10–15, 15–12, for the women's national singles crown, the doubles honours going to Mrs. John Carrott, Greenwich, Conn., and Frances McGurn, Philadelphia. Mrs. E. I. Beatty, Jr., Philadelphia, took the women's veterans' title. (T. V. H.)

Stalin, Joseph Vissarionovich (1879–), Soviet prime minister, was born at Gori, Georgia, Transcaucasia, on Dec. 21. For his early career see *Encyclopædia Britannica.* According to U.S. government sources, Stalin interrupted the writing of his memoirs early in 1951 and returned to Moscow when the Communists began to advance below the 38th parallel in Korea. He made a bitter attack on Feb. 16 on Clement Attlee, the British prime minister, for a statement in the house of commons that the Soviet Union had not fully demobilized after World War II. This, Stalin said to a *Pravda* representative, was a lie. He prophesied that if Great Britain and the United States rejected Chinese peace proposals "the war in Korea can end only in the defeat of the interventionists."



"THE CHESS GAME," a 1951 cartoon published in *Candido* (Milan, It.)

Stalin attended the budget session of the Russian Soviet Socialist Republic in April and a display of about 500 soviet planes in Moscow in July. He sent a sable coat and a writing set of Urals stone to Queen Narriman of Egypt as a wedding present in May.

On Oct. 6 he announced that one type of atomic bomb had been tested in the U.S.S.R., the first admission that an atomic bomb had in fact been exploded there. Tests on "various calibres" of bomb, he said, would be carried out. He thought that the advocates of the use of the atomic bomb might agree to its prohibition now that they could see that they did not have a monopoly in atomic weapons. (*See* also UNION OF SOVIET SOCIALIST REPUBLICS.)

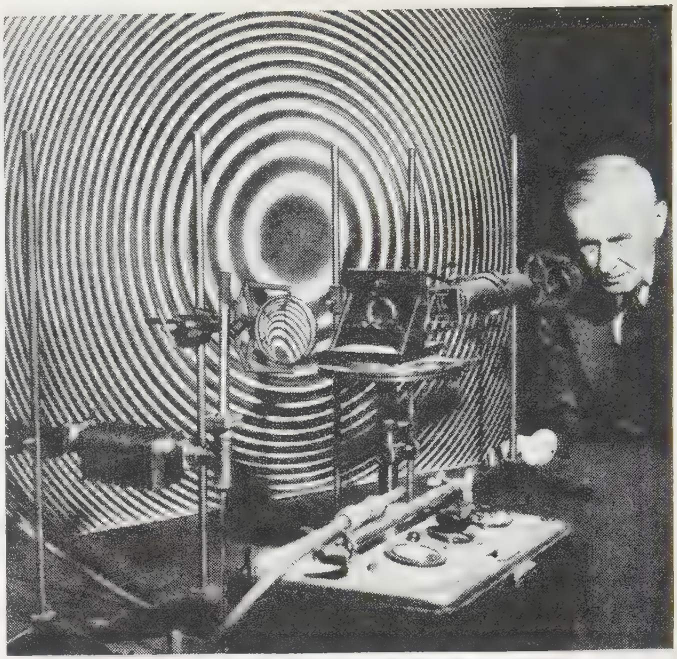
Stamp Collecting: *see* PHILATELY.

Standards, National Bureau of. Established by act of congress, March 3, 1901, the national bureau of standards is the principal agency of the federal government for basic and applied research and development in physics, mathematics, chemistry and engineering. During 1951 it consisted of 24 divisions and offices: 15 scientific divisions (electricity, optics and metrology, heat and power, atomic and radiation physics, chemistry, mechanics, organic and fibrous materials, metallurgy, mineral products, building technology, applied mathematics, electronics, ordnance development, radio propagation and missile development); 3 offices (basic instrumentation, scientific publications and weights and measures); and 6 administrative divisions (fiscal, personnel, shops, plant, supply and services).

New facilities were obtained during the year. A 100-ac. site with 300,000 sq.ft. of buildings was acquired from the navy at Corona, Calif., and modified for laboratory work. At the end of the year the bureau's missile development division had completed its move to Corona. Projects in electronic physics, optics and engineering were also initiated there. Construction of facilities for cryogenic research was well under way, initiated for the bureau by the Atomic Energy commission, at the 200-ac. Boulder (Colo.) site acquired by the bureau. A major radio laboratory also was to be constructed, beginning early in 1952.

Major military programs included guided missiles (navy), proximity fuses (army) and nuclear and atomic research (Atomic Energy commission). Details on these and other defense projects were necessarily restricted. The nonmilitary work of the bureau covered every field of the physical sciences and was concerned with scientific standards of measurement, instruments and methods of measurement, properties of materials, physical constants and a wide variety of services (calibration, testing, standard samples and advisory services). This work was in many cases basic to progress in other laboratories and in industry.

The diversity of the 1951 program is suggested by the work related to the medical and dental professions, which included more than a score of projects. For example, a study of the skin temperature differences between corresponding points on the limbs of patients having peripheral vascular disorders was made. Work was begun on the development of an instrument for use by anaesthesiologists to measure continuously, to indicate visually and to record systolic and diastolic blood pressure, pulse rate, arrhythmia and respiration volume and rate during surgery. An investigation of dextran as a blood plasma extender was begun, and various materials for possible stockpiling as blood plasma were assessed. In studying the fundamental character of tooth structure, progress was made toward understanding the structure of the basic calcium phosphates which comprise the major portion of the inorganic constituent of teeth. A new silicone resin pigment was developed for marking clinical thermometers, which resists constant immersion in germicides and cleaning solutions. A simple method was worked out for determining the correct sound pressures which must be produced in the ear canal by the audiometers used to measure hearing loss.



PRIMARY STANDARD OF LENGTH adopted by the National Bureau of Standards in 1951, consisting of a spectroscopic lamp (left foreground) containing one pure isotope of mercury. Measurements were based on the circular interference fringes of green light (background) from the lamp

A broad program of research was carried on in atomic and radiation physics. Radiation scattering experiments were begun to obtain data for the design of nuclear shielding. Studies were made with the 50,000,000-v. betatron to determine optimum wall thicknesses for protective barriers against high-energy X-rays. A new type of photographic film dosimeter for detecting and measuring atomic radiation was developed. A special radiation source and related equipment were developed to provide field calibration of radiation measuring instruments. Development of a standardized line of field X-ray equipment was substantially completed. The first comprehensive descriptions were made of the optical spectra of technetium and promethium, two new elements produced by uranium fission.

Work in physics included extensive studies at extremely low and high temperatures. At temperatures close to absolute zero, investigations of the isotope effect in superconductivity were continued and extended to isotopes of tin and thallium. Further studies of liquid helium II guided methods for measuring its basic thermodynamic properties. In connection with turbojet combustor design, the rates of inter-change of temperature and velocity between coaxial streams of hot and cold gas were studied under a variety of operating conditions. Studies of flame temperatures were carried out spectroscopically in the ultraviolet and infra-red regions of the spectrum. The heat capacities of sodium, potassium and three sodium-potassium alloys were determined at temperatures up to 1,173° K.

The magnetic properties of various iron and steel alloys were studied. The dielectric properties of new electrical insulating materials were measured. A new type of battery, delivering large currents for an unusually long time, was developed, as well as a dry cell for use in regions of extreme cold. A new and economic system for measuring visibility at airport weather stations was devised. Sonic methods were developed for measuring the viscosity of gases and for continuous indication of the velocity of sound in a liquid. An instrument was designed and constructed for accurate measurements of vibrations having very small amplitudes, and applied in calibrating gauges for vibration measurements in machinery, buildings and the soil.

Studies of the upper atmosphere and its effect on the propagation of radio waves included ionospheric winds, atmospheric radio noise and radio astronomy. Extensive work was conducted on frequency-channel allocations at very high frequencies. Monthly predictions were issued on the best radio frequencies, and standard frequency and time signals were broadcasted continuously over national bureau of standards stations WWV in Maryland and WWVH in Hawaii. A new atomic clock, using atomic-beam techniques, was nearing completion.

The work in electronics largely involved new and highly specialized circuits, components and devices. A low-cost multichannel telemeter system was developed and constructed. High-temperature adhesive-tape resistors were developed for use in printed circuits. A new casting resin was developed for potting electronic circuits. A currency counter was developed for the treasury which would save the government $250,000 annually in treasury counting operations. A large-scale electrostatic memory for computers was designed. The national bureau of standards computer was operated continuously during the year, day and night, on a wide variety of critical problems in the physical sciences and mathematics.

More than 300,000 calibrations and tests were performed, and 25,000 standard chemical samples were issued. Typical services: sample testing of 3,000,000 clinical thermometers, 10,000,000 bbl. of cement and 7,000,000 light bulbs; calibration of 4,500 gauge blocks, 900 water current meters and 35,000 capacity measuring devices; distribution of 1,300 samples of radioactive materials and measurement of 800 radon-breath samples from workers in radioactive environments.

The results of the bureau's work are available through three monthly periodicals (*Journal of Research*, *Technical News Bulletin* and *Basic Radio Propagation Predictions*) and a series of nonperiodical publications. An indexed list of publications (*Publications of the National Bureau of Standards*, circular 460) is available from the superintendent of documents, U.S. government printing office, Washington 25, D.C. (H. Od.)

Stars: *see* Astronomy.

Stassen, Harold Edward

(1907–), U.S. college president, was born on April 13 in West St. Paul, Minn. He studied at the University of Minnesota, Minneapolis, was admitted to the bar in 1929 and in 1930 was elected county attorney, holding the post for eight years. He was elected governor of Minnesota in 1938 on the Republican ticket, and was re-elected in 1940. He was temporary chairman and keynote speaker at the Republican national convention in 1940, and resigned as governor in 1943 to join the U.S. navy, where he served as flag officer to Adm. William F. Halsey, Jr. He was a delegate to the United Nations San Francisco conference in 1945, and in 1948 was a strong rival for the Republican presidential nomination, but lost in the convention polling to Gov. Thomas E. Dewey of New York.

Stassen accepted the presidency of the University of Pennsylvania later that year.

On Nov. 3, 1951, he won the Minnesota state Republican convention's endorsement for the 1952 presidential nomination. He did not immediately announce his intention to campaign actively for the nomination, but he did state that he opposed the candidacy of Sen. Robert A. Taft of Ohio. In early 1952, however, he confirmed that he was a candidate and his name was entered in several state primary elections.

He was considered an advocate of the policy of restraining Communist aggression by giving full support to the European rearmament program, and it was on this issue in particular that he was considered to be in active opposition to Senator Taft.

Stocks and Bonds.

U.S. Stocks.—Based upon Standard and Poor's composite index of 90 stocks, as shown in Table I, U.S. common stock prices in 1951 continued the bull market which began about the middle of 1949. The index showed a substantial increase, January to March 1951, when a reaction occurred. Thereafter, common stocks moved up until June, when a second decline occurred. After this the average moved up again until November when another decline was experienced. A broader index of the Securities and Exchange commission, based upon an average of 265 common stocks on the New York Stock exchange, showed a similar trend. At the end of December, common stock prices were close to their highs for the year and were the highest since 1930.

Table I also reveals that the industrial and public utility stocks carried the composite average to new highs. In January the industrial average was 213. At its high in September it was almost 239, an increase of more than 12%. At the year-end, industrials were up more than 11%. Public utility stocks ended the year with an increase of approximately 11%. On the other hand, the railroad stocks declined from March to July; and in spite of a recovery thereafter, they ended the year with slightly lower average. Preferred stocks of the highest grades also declined in price during the greater part of 1951.

The number of shares traded on the various exchanges, as reported by the Securities and Exchange commission for the first nine months of 1951, was about 3% less than for the same period of 1950. Expressed on a money value basis, the trading on all exchanges during the first nine months of 1951 was about 5% more than in the comparable 1950 period. For the full year 1951, the volume of shares traded on the New York Stock exchange was 443,504,076 as compared with 524,799,621 shares in 1950, 272,203,402 shares in 1949, 302,218,965 shares in 1948, 253,623,894 shares in 1947 and 363,709,312 shares in 1946.

On Nov. 1, 1951, according to a compilation of the New York Stock exchange, there were 2,592,311,000 shares listed on the

SALES AND PRICES on the New York Stock exchange, 1951

exchange, with a total value of $106,439,230,000 and a flat average price per share of $48.28. Of the 1951 total value (Nov. 1), United States stocks amounted to $104,263,384,000 and foreign stocks were $2,175,848,000 in value. The total number of shares were distributed over 1,462 separate United States issues and 22 foreign issues.

Dividends paid to stockholders during the first nine months of 1951, as reported by the New York Stock exchange, were much larger than in the same period for 1950, in spite of larger taxes. A total of $3,730,093,000 was paid out to owners of common stocks listed on the New York Stock exchange during the first three quarters of 1951, or 9.4% more than was paid in the same period of 1950. Also, 1951 was the ninth consecutive year in which dividend payments for the first nine months were larger than in the same period of the preceding year.

For the last quarter of 1951, however, dividend payments fell below those paid in the last quarter of 1950. For all of 1951, nevertheless, they exceeded somewhat those paid out during the whole of 1950. In 1950, dividend payments of $9,200,000,000 constituted 40% of profits, which totalled $22,800,000,000. In the third quarter of 1951, according to department of commerce estimates, profits of domestic corporations were at an annual rate of slightly more than $17,000,000,000; and for the last quarter of 1951, dividend payments were at an annual rate of slightly more than one-half of profits earned.

The following factors may be mentioned as important in their influence on common stock prices during 1951: (1) a high yield compared with that from good-grade corporate bonds; as shown by Table I, the yield throughout the year on a composite list of 90 stocks was about 6%; as shown by Table II, the yield on high-grade corporate bonds throughout the year was a little less than 3%; (2) an excess of earnings over dividends paid by corporations, approximating roughly 100% of their dividend payments; (3) the protection against inflation, which many believed that common stocks afforded. Regarding this latter point, the accelerated war-defense program, the strong demand for basic raw materials, the cutbacks in production of some civilian goods, the increased commitments to Atlantic pact countries, the failure of wage and price controls and other similar factors all tended to increase the attraction of common stocks as an inflation hedge.

U.S. Bonds.—U.S. government long-term bond prices, according to Table III, started a steady and appreciable decline in March 1951, reaching their lows for the year in December. There was considerable recovery in July, August and September, with a decline thereafter until the end of the year. Corporate bond prices, as shown in Table II, followed a similar pattern. They started to decline in March, reached a low in July, recovered until September and then started to decline again. According to the Standard and Poor's indexes, U.S. government bonds ended the year 1951 with a decline of a little more than 3.8%; and U.S. corporate A1+ bonds with a decline of slightly more than 5.4%.

Sales of bonds on the New York Stock exchange for 1951 were lower than those for 1950 but higher than for 1949. Total sales for 1951 amounted to $824,002,920, compared with $1,112,425,170 for 1950, $817,949,070 for 1949 and $1,013,829,210 for 1948.

According to a compilation by the New York Stock exchange, the total par value of bonds listed on the exchange on Nov. 1, 1951, stood at $99,205,637,000, with a market value of $97,511,474,000. U.S. corporation bonds (Nov. 1) amounted to $17,848,262,000 par value, with a market value of $16,803,315,000; company bonds of other countries with a par value of $503,723,000 and a market value of $407,224,000; U.S. government bonds (including state and municipal, etc.) with a par value of $79,214,497,000 and a market value of $79,072,453,000; and foreign governments with a par value of $1,339,154,000 and a market value of $937,989,000. The total listed bonds of United States corporations were distributed over 610 issues of 302 issuers; U.S. government bonds over 62 issues of 3 issuers; and foreign government bonds over 185 issues of 51 issuers.

Source: *Commercial and Financial Chronicle*, Dec. 3, 1951.

As shown in Tables II and III, yields increased with the decline in bond prices. On corporate bonds, yields rose from 2.61% in January to 2.92% in July; and on U.S. government long-term bonds the increase for this period was from 2.40% to 2.68%.

From January to December the increase was from 2.61% to 3.01% for corporate bonds; and from 2.40% to 2.72% for long-term governments.

The spread between the yields of bonds and stocks narrowed in 1951 as compared with 1950, although the difference still was wide by comparison with the years prior to World War II. In Jan. 1951 the average yield on A1+ corporate bonds was 2.61% and the average yield on 90 composite stocks was 6.34%, a difference of 3.73 basis points. In Dec. 1951 this difference had narrowed to 2.97 basis points.

The most important factor affecting prices of high-grade bonds in 1951 was the unpegging of government bonds by the federal reserve board which started in March. Prior to this date the board had supported the federal bond market when necessary in order to keep long-term government bonds above par. In this manner the board co-operated with the treasury department for the purpose of maintaining a low interest-rate policy. As soon as the board withdrew its support, prices of some long-term government bonds found their own level well under par. Support of bond prices was withdrawn by the board in order to increase interest rates and thereby help in curtailing the expansion of credit and, hence, inflation.

New York Stock Exchange.—On Jan. 15, 1951, the exchange announced the details of an $800,000 public educational program. On Jan. 16 the exchange announced its co-operation in the observance of the federal reserve board's increase in margin requirements from 50% to 75%, effective Jan. 17. On Feb. 15 the board of governors appointed a committee for consideration of closing the exchange on Saturdays throughout the year, rather than closing only on Saturdays in June, July, August and September.

On April 12 the board announced that the exchange would not close Saturdays, except during the four summer months. On May 24, it was announced that George K. Funston, president of Trinity college, Hartford, Conn., had accepted the presidency of the exchange under a three-year contract. On Oct. 9 the exchange reported that for the nine months ending Sept. 30, 1951, operation had been conducted with a profit of $456,202, compared with a profit of $769,349 for the same period of 1950, and a net loss of $325,995 for the like period of 1949.

New Issues.—The amount of common stock issued by U.S. private corporations in 1951, as reported in the *Commercial and Financial Chronicle,* was higher than in any previous year from 1946. A comparison of the years of 1947, 1948, 1949 and 1950 with 1951 showed a steady increase each year in the issuance of common stock of new capital purposes. Public utility corporations issued many more securities of all kinds in 1951 than any other single type of corporation; and this was true also for the years going back to 1946.

TRADING IN STOCKS on the New York stock exchange: yearly range of prices and number of shares sold, exclusive of odd-lot and stopped sales

Another important feature of equity financing by private corporations in 1951 was the large amount of convertible preferred stocks issued.

Issues of farm loan and other government agencies and issues by states and their subdivisions were large during 1951, although issues by states and their subdivisions during this year were somewhat less than in 1950. (*See* Table IV.)

Private placement of security issues continued to be a much used method in 1951, with issues privately placed during the first nine months averaging over 38% of the total. (*See* also SECURITIES AND EXCHANGE COMMISSION.) (C. A. K.)

Great Britain.—British government securities fell roughly 10% between the opening and close of the year; most if not all issues touched the lowest prices since 1933, that is, almost since the era of cheap money was first ushered in with the conversion of the war loan in 1932 from a 5% to 3½% coupon.

In the first six months, industrial ordinary shares rose by more than 20% and virtually attained again the record postwar level of Jan. 1947, but by the end of the year prices were nearly back again to the Jan. 1951 levels. Prices of gold-mining shares sank to those ruling before sterling devaluation raised the price of gold in 1949. In the main, shares in commodity-producing companies did well, especially in the oil, copper and tin industries, but following the slump in rubber after its spring boom, rubber shares could do no more than hold their ground on the year.

Despite official warnings that the nation was faced with a series of economic problems as difficult as any after World War II, a current of optimism ran through markets in the early months of the year. The popularity of the Labour government was on the wane and investors were prepared to discount the prospect of an early general election and the return of a Conservative government to power. World-wide inflation of the prices of goods and services brought about by the rearmament and stock-piling programs tended to promote a movement out of fixed interest stocks into equities, mainly into industrial ordinary and those of commodity-producing companies.

The sympathetic influence of Wall street on London prices had always been considerable, and Wall street encouraged investors by reaching 20-year peaks. The nationalization of the iron and steel industry in the United Kingdom on Feb. 15 resulted in about £236,000,000 3½% British Iron and Steel Guaranteed stock, with maturity dates 1979–81, being issued in compensation. The terms of issue implied a reduction of income for many holders who sought reinvestment in equities offering higher yields.

Equity investment was also stimulated by the publication of record profits by many industrial companies, partly as a re-

sult of the rise in the value of stocks of materials and goods. Industrial share prices went further ahead when the Labour government's budget proposals proved to be less drastic than had been feared. The worst feature of the budget so far as company taxation was concerned was a rise from 30% to 50% in the distributed profits tax, but against this the optimists could point to the official expectation that company profits in 1951 would be a good deal higher than in 1950, a forecast which turned out to be correct.

The election of a Conservative majority to parliament on Oct. 25 was a critical point for markets. When the new economic and monetary policy of the Conservative government to prevent the country from becoming "bankrupt, idle and hungry" was introduced, the effect on stock markets was profound. The Labour government had already abandoned the cheap money policy to the extent of allowing long-dated British government securities to find their own level while holding short-term rates unnaturally low. It became apparent, however, that the Conservative government, which had raised the bank rate from 2% to 2½%, was prepared to allow its new monetary measures—aimed at discouraging credit expansion—to work themselves out in both "short" and "long" securities. As a result, by the end of the year substantial falls had taken place without the market yet finding a stable level. (A. L. W. S.)

Stomach and Intestines, Diseases of.

Peptic ulcer probably is more common than is generally appreciated; thus, in a group of children examined by X-ray the incidence was 10%. The importance of stomach acidity in the formation of ulcer received additional emphasis during 1951. In dogs, stimulation of gastric secretion by the hormone gastrin caused typical ulceration; surgical removal of the antrum of the stomach eliminated this hormonal influence and decreased the acidity. In man, the recurrences of peptic ulcer during the administration of ACTH and cortisone were attributable directly to the increased production of acid and pepsin. The search for better methods of controlling the acid continued during 1951. The results with protein hydrolysates, anion exchange resins and enterogastrone remained disappointing; and the effects of several new antacid preparations were not impressive.

Suppression of gastric secretion by compounds acting upon certain nerve mechanisms (cholinergic blocking agents) was studied in detail. Atropine was not effective since it decreased stomach acidity in only one-third of patients with duodenal ulcer; uncomfortable side effects developed frequently. The action of the synthetic preparation dibuline was similar. Tetraethylammonium salts, given by injection, and hexamethonium compounds, taken by mouth, decreased gastric secretion temporarily, relieved pain and facilitated the healing of peptic ulcer. These compounds produced undesirable reactions, however, including a fall in blood pressure upon standing, fainting, weakness, blurring of vision and dryness of the mouth. Banthine decreased acidity and gastrointestinal motility when injected intramuscularly; these effects were less pronounced when the drug was administered by mouth. Banthine also produced reactions similar to those already mentioned. Although it was not consistently effective in many cases, banthine appeared to be a useful addition to antacid treatment.

There was no unanimity of opinion among surgeons regarding the most effective operative treatment of duodenal ulcer. The value of cutting the vagus nerves to the stomach (vagotomy) in the surgical treatment of duodenal ulcer was reaffirmed by Lester Dragstedt, whose series now exceeded 740 patients. Persistent lowering of gastric secretion was demonstrated two to seven years after operation, indicating that the nerves do not regenerate. Many surgeons, though accepting the usefulness of vagotomy for ulcers developing after certain operations upon the stomach, nevertheless preferred partial removal of the stomach (gastric resection).

Gastric acidity was found to be subnormal in patients with cancer of the stomach; the lowered secretion apparently preceded the development of the tumour. Earlier recognition of this disease had become increasingly important because of improving surgical techniques and survival rates. The operating gastroscope, permitting removal of tissue for examination, revealed the cancer in some cases; however, this procedure was not generally applicable. Study of the cells in the stomach contents as a method of diagnosis seemed more promising. The use of a solution of papain and the introduction of a balloon encased in a hat veil into the stomach were designed to provide more suitable material for this purpose; the early results were encouraging. A new "stomach" was created in patients requiring total removal of this organ for cancer by transplanting a portion of the large bowel; initial observations indicated surprisingly adequate function in the transplanted structure.

Intestines.—Antibiotics, including chloramphenicol (chloromycetin), terramycin, neomycin, bacitracin and polymixin, were administered in the treatment of various gastrointestinal infections. Chloramphenicol induced prompt improvement in typhoid fever; however, haemorrhage or perforation complicated treatment occasionally and development of the chronic carrier state was not prevented. None of the antibiotics excelled sulfadiazine in the treatment of bacillary dysentery. Results in other bowel infections varied but were good in individual cases. Polymixin B was most effective in the control of infections with certain resistant bacteria (proteus and pseudomonas). Aureomycin and chloramphenicol appeared helpful in the rectal inflammation accompanying the venereal disease lymphopathia venereum. Favourable results with aureomycin were observed occasionally in patients with inflammation of the gall bladder and acute and chronic infections of the liver. It should be noted that large quantities of this antibiotic by mouth and by vein injured the liver in animals and occasionally in man. Antibiotics had no specific effect in ulcerative colitis or regional enteritis but they were of value in the treatment of secondary infection. Many reports emphasized the undesirable side effects occurring during antibiotic therapy; these were probably even more common than the literature indicated. Increasing attention was directed also to superinfection with bacteria originally regarded as harmless, bacterial infections resistant to current antibiotics, and to the laboratory demonstration that chloramphenicol interfered with the antibacterial action of penicillin or streptomycin.

New developments in the treatment of intestinal amoebiasis included the combination of carbarsone and atabrine, and the administration of terramycin, aureomycin and bacitracin. Chloraquine was more effective in amoebic infections of the liver. Antibiotics may be most useful in the management of amoebiasis as adjuncts to standard amoebicidal therapy.

The causes of ulcerative colitis and the treatment of this serious disease were investigated extensively during 1951. The large quantities of lysozyme produced experimentally after injury of the bowel and the failure of this enzyme persistently to damage the colon in dogs suggested that lysozyme was not of primary importance in the development of the disease, as had been thought originally. The concentration of lysozyme in the faeces increases during the active stage of ulcerative colitis and decreases with healing. However, the administration of anti-lysozyme compounds did not improve the course of the disease significantly. The importance of emotional stress was re-emphasized; psychotherapy was helpful in several groups of patients. As in other diseases, ACTH or cortisone did not cure ulcerative colitis but were definitely beneficial. The clinical response included subsidence of abdominal distress and diarrhoea, increased appetite and sense of well-being and healing of the inflammatory process. The improvement was no more complete than had been observed previously without ACTH, but it was more rapid and at times dramatic. Relapses were frequent but they seemed to be less severe.

ACTH and cortisone also were helpful temporarily in some patients with regional enteritis, but the results were less striking. Attitudes concerning the need for operation in ulcerative colitis continued to vary in 1951, although medical treatment was recommended in the majority of cases. Removal of the diseased large bowel and the establishment of a new opening in the small intestine (ileostomy) were necessary in a small group of cases with especially severe ulcerative colitis. The frequency of cancer of the bowel in two groups of patients with ulcerative colitis was 3.9% and 4.9% respectively, definitely higher than in the general population. In a more encouraging report, sustained improvement, clinically and by X-ray, was demonstrated in 24 patients with the disease.

Examination of the rectum by the proctoscope continued to be a valuable method for the earlier diagnosis of cancer in this region of the alimentary tract. Several surveys based upon this procedure indicated an incidence of polyps ranging from 7% to 10%. Since these polyps frequently undergo malignant transformation, their prompt removal is an effective method of cancer prevention.

Liver.—The course of infectious hepatitis, a viral infection of the liver, usually is mild and ends in complete recovery. Chronic hepatitis, cirrhosis, or massive destruction of the liver occurred in a small percentage of cases. A new skin test for the diagnosis of this disease was undergoing evaluation in 1951.

Cirrhosis of the liver had proved to be more common than appreciated; it may not produce symptoms. Examination of liver tissue obtained by the introduction of a needle remained the best method of diagnosis. The bromsulfalein excretion test was the most useful measure of liver function in patients without jaundice. Patients with cirrhosis and excess abdominal fluid (ascites) reacted unfavourably when the fluid was removed too frequently, because this procedure resulted in serious loss of protein and electrolytes. A low intake of salt and the use of resins facilitating the removal of sodium via the bowel proved helpful in retarding or preventing the reaccumulation of fluid. The value of a high protein diet, including salt-poor human albumin, in the treatment of this disease was re-emphasized.

Haemorrhage from enlarged veins in the oesophagus is an important cause of death in cirrhosis. Excellent results were reported in the treatment of this complication by surgically uniting the portal vein to the inferior vena cava or the splenic to the renal vein. In one series, 47 of 50 patients treated by these procedures were alive and well; in a second group of 111 cases the over-all mortality was reduced to 16.2%. The operation is most effective in patients with good liver function.

Pancreas.—The diagnosis of pancreatic disease had been handicapped by the lack of adequate tests of pancreatic function. More frequent measurement of the serum amylase led to the increased recognition of pancreatitis in 1951. Favourable results in relieving the severe pain of acute and chronic pancreatitis were reported with the surgical procedures of cutting the vagus, sympathetic or splanchnic nerves.

Strikes.

In 1950 there were 4,843 strikes in the United States, an increase of 1,237 from the 1949 total of 3,606. However, the number of workers involved (2,410,000) and the idle man-days (38,800,000) in 1950 were considerably less than in the previous year, as shown in Table I.

The number of strikes in the first eight months of 1951 did not differ greatly from the number of strikes for the corresponding period in 1950. Likewise, there was no significant difference in the number of workers involved in strikes during these two periods. Nevertheless, there was a large decline in the idle man-days in the 1951 period, the eight-month 1951 figure of 14,900,000 being approximately 50% less than the corresponding figure for 1950.

These statistics published by the U.S. bureau of labour statistics included all known work stoppages arising from labour-management disputes that continued for at least one full day or shift and involved six or more workers. The data on man-days idle and workers involved covered all workers made idle in establishments directly involved in a stoppage and not those employees made idle through material or service shortages incurred by such stoppages.

Table I.—*United States: Number of Strikes Beginning in the Year, Workers Involved and Man-days Lost*

Year	Number of strikes	Number workers involved	Man-days idle during year	Per cent of estimated work time
1935–39 (average)	2,862	1,130,000	16,900,000	0.27
1946	4,985	4,600,000	116,000,000	1.43
1947	3,693	2,170,000	34,600,000	.41
1948	3,419	1,960,000	34,100,000	.37
1949	3,606	3,030,000	50,500,000	.59
1950	4,843	2,410,000	38,800,000	.44
1951 (8 mo.)	3,075	1,550,000	14,900,000	.24

PICKET LINE formed by pilots of the United Air Lines who demanded pay based on miles rather than working hours because of increased flying speed. The ten-day walkout by 900 pilots ended June 29, 1951

Work stoppages arising from industrial disputes in Great Britain for the first nine months of 1950 and 1951 are indicated in Table II. As in 1949 and 1950, the majority of strikes in the first nine months of 1951 arose in coal mining, with 796 strikes through Sept. 1951—the total number of work stoppages having been 1,318 during this period. Although the number of strikes in the coal mining industry was greater in the first nine months of 1951 than in the similar period for 1950, the number of workers involved in these strikes and the number of working days lost were not so large. Other industries with a relatively large number of strikes were shipbuilding and ship repairing, building and contracting, transport, engineering and vehicles. Although the number of strikes in each of these industries was less than 10% of the number of stoppages in mining for the 1951 period under consideration, the number of working days lost in the transport industry was more than double the number lost in mining, and the number of working days lost in the vehicles group was not much smaller than that lost in mining.

Wage disputes were the predominant cause of industrial stoppages in Great Britain for the first nine months of 1951. The major share of these wage disputes was not for wage increases, but was concerned with other wage issues. Disputes over the employment of particular classes or persons, and other working arrangements, were also major causes of work stoppages.

Comparative figures for the first nine months of 1950 and 1951 showed a larger number of strikes in progress in every month except March in 1951.

As Table IV indicates, however, the number of working people involved and the number of working days lost did not necessarily increase (decrease) when the number of stoppages increased (decreased).

In Canada in the first eight months of 1951 there were 55 more strikes and lockouts than for the corresponding period in 1950. However, the number of workers involved in industrial disputes and the number of days lost during the 1951 period were considerably less than 50% of the corresponding numbers for 1950, the latter having been greatly increased by the railway dispute of that year. (*See* also LABOUR UNIONS; NATIONAL LABOR RELATIONS BOARD; UNITED STATES.) (P. TA.)

Table III.—*Analysis of Principal Causes of Industrial Disputes in Great Britain: First Nine Months of 1951*

Principal causes	Number of stoppages begun during 1951	Number of workers directly involved
Wage increase	152	59,400
Other wage disputes	491	70,000
All wage disputes	643	129,400
Hours of labour	27	2,200
Employment of particular classes or persons .	185	58,100
Other working arrangements	389	54,800
Trade union principle	23	7,600
Sympathetic action	11	16,900
Total	1,278	269,000

Suez Canal.

For two reasons the Suez canal was the subject of international political tension during 1951: first, because Egypt was accused before the security council of the United Nations for its restrictions on goods in transit through the canal; second, because the Egyptian government took drastic steps to enforce the evacuation of the Suez canal zone by the British troops stationed there.

Claiming that it was formally at war with Israel, Egypt continued its policy of "blockading" it, that is, refusing to allow the transit through the canal of war material, mainly fuel oil, to Israel. The British government protested in Cairo against these restrictions, describing them as illegal because they contravened the 1888 convention guaranteeing free passage to all traffic through the canal, and also because an Egyptian-Israeli armistice was concluded on Feb. 24, 1949. Ten other governments sent similar protest notes to Cairo but Egypt remained adamant. The dispute was referred to the security council and the formal complaint came from Israel. The case was considered at Flushing Meadow, N.Y., from July 26. A resolution sponsored by Great Britain, France and the United States was introduced on Aug. 16 calling on Egypt to terminate the restrictions on the passage of shipping and goods through the Suez canal wherever bound. The resolution was passed on Sept. 1 by eight votes to none, the U.S.S.R., India and nationalist China abstaining. An Egyptian government spokesman declared on the same day in Cairo that his government had no intention of implementing the resolution.

On Oct. 8, Mustafa el Nahas Pasha, prime minister of Egypt, tabled among others a decree abrogating the Anglo-Egyptian treaty of 1936 under which British troops were stationed in the Suez canal zone. It was passed by both houses of parliament on Oct. 15. On the night of Oct. 16–17, Lieut. Gen. Sir George Erskine, commanding the British troops in Egypt, seized Ismailia, Kantara East and West, the railway bridge linking Egypt and Sinai at El Ferdan and the ferry at Kubry, 5 mi. north of Suez. At the same time reinforcements were rushed to the canal zone by air from Cyprus and Libya and by sea from Britain. By the end of the year the British position in the zone was considered defensible.

At the annual general meeting of the Suez Canal company held in Paris on June 12, François Charles-Roux, its president, said that the traffic through the canal in 1950 was larger than ever: 11,751 transits were made, representing a total of 81,795,523 net registered tons, compared with 10,420 transits in 1949 (68,861,548 n.r.t.). Receipts for 1950 amounted to 28,020,300,000 fr., an increase of 2,083,300,000 fr. over those of 1949, whereas expenses at 10,705,500,000 fr. showed a reduction of 334,800,000 fr. After deduction from the gross profit of 1,152,600,000 fr. for interest and amortization of the capital, the available profit stood at 16,162,200.000 fr., but 2,000,000.000 fr. were allocated to improvement works planned in the company's seventh program.

Goods in Transit Through the Suez Canal

('000 metric tons)

	1938	1946	1949	1950	(6 months) 1951
Southward	7,767	6,000	13,032	12,144	7,528
Northward	21,012	15,936	48,024	60,468	29,469
Total	28,779	21,936	61,056	72,612	36,997

The first stage of the seventh program—the 7½-mi. by-pass canal halfway between Port Said and the Bitter lakes—was completed during the year. (*See* also EGYPT.)

Sugar.

The average U.S. civilian in 1951 consumed three-fourths of his weight in sugar, only one-fourth of which was produced domestically. Sugar production in 1950–51 in the principal areas supplying the United States was a record 12,198,000 tons, with a slightly larger crop in prospect for 1951–52. Production in the U.S. proper was estimated at only 1,967,000 tons as compared with 2,576,000 tons in 1950 and an average for 1940–49 of 1,924,000 tons. The 1951 U.S. crop included an indicated 1,588,000 tons of beet sugar and 379,000 tons of cane sugar; in 1950 the comparable data were 2,012,000 tons and 564,000 tons, but the averages for 1940–49 were 1,482,000 tons and 442.000 tons, respectively.

The U.S. sugar-beet crop in 1951 was 10,584,000 tons, 22% less than the 1950 record crop of 13,535,000 tons but more than the 9,880,000-ton average for 1940–49. The yield was favourable at 15.1 tons per acre, as compared with 14.6 tons per acre in 1950 and an average for 1940–49 of 13.1 tons. Hence, the crop decline was accountable to a sharply reduced acreage, from 925,000 ac. in 1950 and the 750,000-ac. average for 1940–49, to 702,000 ac. in 1951. Plantings of 887,000 ac. were indicated by farmers in March but the July crop report showed only 770,000 ac. planted—a reduction apparently based on fear of inability to obtain beet field labour and competition with other more profitable crops. California, as usual, was the leading state.

The U.S. sugar-cane crop of 1951 for sugar making was 5,187,000 tons, as compared with 6,481,000 tons in 1950 and an average of 5,491,000 tons for the previous decade. The yield of 18.5 tons per acre and the harvested acreage of 280,500 were sharply lower than comparable data for 1950 and slightly below the 1940–49 average.

Sugar-cane syrup production in the south in 1951 continued its sharp decline of prior years, falling to 5,140,000 gal., the smallest crop on record, compared with 9,230,000 gal. in 1950 and an average for 1940–49 of 19,008,000 gal. A sharply decreased acreage accounted for most of the decline. Sorgo (or sorghum) syrup production in 1951 declined to 2,831,000 gal., from 3,691,000 gal. in 1950. Even maple syrup and maple sugar declined in 1951—1,809,000 gal. of syrup (2,062,000 gal. in 1950) and 200,000 lb. of sugar (a record low) as compared with 257,000 lb. in 1950. Honey in 1951 was an excellent crop of 249,053,000 lb., as compared with 233,013,000 lb. in 1950. Colonies of bees in production were 5,572,000 as compared with 5,612,000 in 1950.

U.S. sugar consumption for 1951 was initially estimated (in Dec. 1950) at 8,000,000 tons by the U.S. department of agriculture for official quota purposes. After sugar exports from the U.S. had been curbed in the spring to conserve lower-priced supplies, the estimate was raised to 8,250,000 tons, but as demand stabilized and inventory building ceased it was lowered to 7,900,000 tons. In Dec. 1951 the official estimate of U.S. requirements for 1952 was set at 7,700,000 tons, moderately

Table I.—*U.S. Sugar-Beet Production*

(In thousands of tons)

State	1951	1950	Average 1940–49
California	2,660	3,927	2,130
Colorado	1,900	2,183	1,882
Idaho	1,253	1,508	1,045
Nebraska	682	812	717
Michigan	589	1,020	704
Montana	544	744	816
Wyoming	445	454	416
Utah	413	535	517
Ohio	126	277	258
Other states	1,972	2,075	1,393

Table II.—*U.S. Sugar-Cane Production*

(In thousands of tons)

State	1951	1950	Average, 1940–49
Louisiana	3,993	5,312	4,577
Florida	1,194	1,169	914

Table III.—Centrifugal Sugar Production of the Principal Producing Countries

(In thousands of tons, raw value)

Country	1951	1950	Average 1935–39
Cuba	6,800	6,349	3,183
U.S.S.R.	2,300	2,400	2,761
United States	1,967	2,576	1,992
Brazil	1,725	1,646	786
India	1,575	1,480	1,300
France	1,375	1,592	1,060
Puerto Rico	1,325	1,230	974
Western Germany	1,200	1,121	610
Republic of the Philippines	1,180	935	1,058
Hawaii	1,100	1,005	980

lower than the revised total for 1951, and sharply below the 8,500,000 tons for 1952 as suggested by commercial users, who ordinarily take about 70% of the total.

In Sept. 1951 the Sugar Act of 1948 was slightly modified and extended to the end of 1956. The major changes (effective beginning in 1953) were to increase Puerto Rico's quota from 910,000 tons to 1,080,000 tons and to double the Virgin Islands' share from 6,000 tons to 12,000 tons. As applied to the 7,700,000 tons estimated for consumption in 1952, the following quota amounts would apply: U.S. beet sugar, 1,800,000 tons; Louisiana and Florida cane sugar, 500,000 tons; Hawaii (cane), 1,052,000 tons; Puerto Rico (cane), 910,000 tons; Virgin Islands (cane), 6,000 tons; Philippines (cane), 974,000 tons; Cuba (cane), 2,424,571 tons; other countries, 33,429 tons, with 250 tons not allocated.

World production of centrifugal cane and beet sugar in 1951–52 was expected to total 36,500,000 tons, slightly more than the 36,400,000 tons of the previous year and much more than the prewar average of 28,900,000 tons. In addition, 6,285,000 tons of noncentrifugal sugar were produced, largely for local consumption in India, Pakistan and some Latin-American countries.

Of the centrifugal sugar total, cane sugar amounted to 22,900,000 tons, 6% more than the record 21,600,000 tons of 1950–51 and 34% larger than the pre-World War II average. Although area planted to sugar beets was increased by 2%, the season was such that the beet crop (98,700,000 tons, about two-thirds of this in Europe) was about 5% less than in 1950 though 20% more than prewar; it gave 13,600,000 tons of sugar, or 9% less than the 14,900,000 tons of 1950–51, but exceeded the 1935–39 average of 11,800,000 tons.

World prices reached a level of about seven and four-tenths cents per pound free alongside ship Cuba in June, but thereafter declined almost two cents per pound. (J. K. R.)

Suicide Statistics.

The mortality record for suicide in the United States during 1951 was appreciably under that for 1950, according to indications provided by the industrial policyholders of the Metropolitan Life Insurance company for the first nine months of both years. The improved suicide situation may be a reflection of the increased tempo of business activity and also of the war in Korea; corresponding situations were observed during World War I and again in World War II. It was estimated that the United States had 17,179 suicides during 1950, so that the rate was 11.4 per 100,000 total population, identical with that for 1949. The 1950 record for Canada was much lower than that for the United States; with 1,054 deaths from suicide, Canada had a rate of only 7.6 per 100,000 total population. England and Wales recorded 4,476 suicides during 1950, and a rate of 10.2 per 100,000 total population.

According to a 10% sample of death certificates gathered by the national office of vital statistics during 1951, the monthly suicide rates per 100,000 total population in the United States were: January, 7.8; February, 9.9; March, 11.1; April, 11.1; May, 11.9; June, 11.3; July, 10.5; and August, 10.5. The rise in rates from a low in winter to a high in spring is typical of the seasonal fluctuation in suicides.

BIBLIOGRAPHY.—Louis I. Dublin, Alfred J. Lotka and Mortimer Spiegelman, *Length of Life* (1949); National Office of Vital Statistics, *Current Mortality Analysis* (issued monthly); Metropolitan Life Insurance Company, *Statistical Bulletin* (issued monthly). (M. Sp.)

Sulphur.

After declining from 5,940,000 short tons in 1948 to 5,820,000 tons in 1949, world sulphur production advanced to 6,380,000 tons in 1950, a new record high. More than 90% of the world total comes from the United States. A dozen minor producers have outputs of a few thousand tons, but the only countries with outputs of significant proportions are Italy and Japan; the former turned out 207,835 tons in 1949 and 234,939 tons in 1950, and the latter 68,784 tons and 101,853 tons in the same years.

United States.—The U.S. bureau of mines reported data on the industry as shown in the table.

Data on Sulphur Industry in the United States

Supreme Court of the United States.

The annual term of the court began Oct. 2, 1950, and ended June 4, 1951. There were no changes in the personnel of the court. Resolutions of the bar adopted at meetings held to commemorate the life and works of Justices Frank Murphy and Wiley B. Rutledge, who died during 1949, were presented to the court at mid-term.

Cases disposed of totalled 1,216 as compared with 1,308 at the previous term. There were 91 signed majority opinions, all but 12 of which involved either the federal or state governments.

The 16 five-to-four decisions rendered represented an increase of 10 over the number of cases decided by one vote at the preceding term. The number of dissenting opinions was the same, or 54.

The number of cases filed totalled 1,181, a decline of almost 100 from the previous term and 300 from the 1948 term.

Members of the Court.—The United States supreme court was composed in 1951 of the following members (dates indicate year appointment was confirmed by the senate): chief justice, Frederick M. Vinson (1946); associate justices, Hugo L. Black (1937), Stanley F. Reed (1938), Felix Frankfurter (1939), William O. Douglas (1939), Robert H. Jackson (1941), Harold H. Burton (1945), Tom C. Clark (1949), and Sherman Minton (1949). (*See* also LAW.) (H. B. Wy.)

Surgery.

Whereas burns were formerly treated locally by occlusive and compression bandages, much emphasis was placed during 1951 upon the importance of the open or exposure treatment of burns. This was in reality a revival of the method of treatment used approximately a quarter of a century earlier. The exposure method of treating burns was abandoned at that time because of the bad results caused by infection. A. B. Wallace and T. G. Blocker showed that open air treatment of burns gave good results. Infections of burns were less likely to occur, and the patients got along better and required less transfused blood than those on whom the occlusive dressings or compression bandages were applied.

Although the importance of the administration of whole blood to patients who were severely burned had previously been emphasized, only recently had this method been used effectively. Because patients who are badly burned have an increased number of red cells, there is a tendency on the part of physicians not to give blood. Blood, however, is extremely valuable. If blood is not available, plasma should be used, and there are also other satisfactory substances which can be used in place of plasma. H. Rosenqvist and H. G. R. Thorsén used successfully a high molecular polysaccharide of glucose, known as macrodex, which was quite successful in the early treatment of burn shock.

Anaphylactic reaction is supposed to be diminished or abolished by the administration of ACTH or cortisone. Therefore, it was suggested that the use of homologous skin graft (grafts from other persons) could be made successfully if the recipient were given ACTH or cortisone. E. H. Ellison and his co-workers and P. A. Weisman and his associates showed that the transplantation of skin from one person to another was not successful even though ACTH and cortisone were administered to the person receiving the grafts.

In cases of cardiac arrest—a condition in which the heart stops and which is incompatible with life, if the action of the heart cannot be re-established quickly—Julian Johnson and C. K. Kirby emphasized that resuscitation can be successfully accomplished. Of greatest importance is immediate massage of the heart to maintain sufficient circulation so that the brain will remain viable. Not more than a few seconds should be allowed to elapse before the chest is opened and the heart is massaged. Johnson and Kirby showed that a continuous contraction of the heart which is spoken of as ventricular fibrillation may occur as a result of lack of sufficient oxygen. This fibrillation may be stopped by means of an electric shock. J. C. Callaghan and W. G. Bigelow used an electrical instrument to re-establish the normal contraction of the heart, and Jerome Kay and A. Blalock used calcium chloride together with other methods of resuscitation in patients with heart arrest.

In patients with cirrhosis of the liver, massive bleeding from the enlarged veins in the esophagus frequently occurs and there may be an associated accumulation of fluid within the abdomen. In order to control the undesirable effects of cirrhosis of the liver and the resultant back pressure on the veins emptying into the liver, J. K. Berman and his associates employed an operation which consists of tying off the main artery to the liver and the spleen. Because the pressure within the vein emptying into the liver is greatly increased in cirrhosis, ligation of these arteries decreases the venous pressure and tends to control haemorrhage and other symptoms associated with cirrhosis of the liver.

Persons who have their gall bladders removed occasionally have persistence of pain which is thought to be caused by spasms of the outlet of the duct leading from the liver into the intestine. This condition was successfully treated by George Crile, Jr. and D. W. Miller by cutting the vagus nerves. A relatively rare condition which consists of a chronic inflammation of the pancreas (chronic pancreatitis) was treated by R. F. Bowers and J. Greenfield by making a new opening between the outlet of the duct leading from the liver and the intestines. In five cases in which this operation was done, all were benefited.

Before the introduction of cortisone, it was impossible to remove both adrenal glands because complete absence of adrenal secretion is not compatible with life. However, with the availability of cortisone and other hormones, it became possible to remove the adrenals and maintain life. Charles Huggins and D. M. Bergenstal successfully treated, by bilateral removal of the adrenal, extensive cases of carcinoma of the prostate, in which satisfactory results had been temporarily obtained by the administration of the female sex hormones, but in which progression of the disease had occurred because the adrenal glands had taken over some of the function of the female sex glands. In these cases, dramatic relief of symptoms and regression of the metastatic prostatic tumours occurred. H. A. Zintel and coworkers successfully treated patients with severe hypertension by removal of the suprarenal glands. As in the patients with cancer of the prostate, these patients with hypertension, who had the suprarenal glands removed, required the administration of cortisone in order to maintain life.

Alton Ochsner *et al.* showed that in the Charity Hospital of Louisiana at New Orleans, in spite of conservative treatment, there was a progressive increase in the incidence of vein clotting. Tying of the veins in certain cases of clotting within the vein was popular. John McLachlin and J. C. Paterson showed that tying the vein is likely to fail in preventing death from the detachment of a clot, because the clot is located on the heart side of the ligature. This was corroborated by Ochsner and his associates, who advocated in such cases tying the large vein (inferior vena cava) and draining the lower extremities and pelvis.

C. T. Klopp and his associates treated inoperable cases of cancer with some success by injection of nitrogen mustard into the artery leading to the tumour in order that the chemical action on the tumour could be more effective. (*See* also Medicine; Physiology.)

Surinam (Dutch Guiana). Surinam lies between French Guiana and British Guiana, in northeastern South America, with an area of 54,291 sq.mi. It consists of a plain slightly above sea level, and seldom attaining a depth of 100 mi., and a high plateau, rich in timber and minerals. The bulk of the population (est. 1951, 211,000) lives on the coastal plain, and includes more than 85,000 indigenous and mixtures of indigenous and European elements, 20,000 Afro-Americans, 35,000 Javanese, and more than 50,000 who were either born in India or descended from persons born there. Approximately 2,000 were born in Europe. The capital is Paramaribo with an estimated population of 78,000 (1951). No other community exceeds 5,000. All citizens of Surinam are Netherlandish subjects. The official language is Netherlandish, but other languages and dialects are widely used. Governor during 1951: J. Klaasesz.

History.—Early in Jan. 1951 a member of the Netherlands cabinet, J. R. H. van Schaik, visited Surinam, announcing the forthcoming conferment of political autonomy. During June, the future financial and economic relations between Surinam and the Netherlands were explored at The Hague, and in December a formal agreement was concluded. Steps were taken to arrange for a comprehensive round table conference between Netherlandish, Surinam and Antilles representatives in the spring of 1952, to settle future constitutional relations.

A mission from the International Bank for Reconstruction and Development reviewed major economic problems of Surinam late in 1951, but its report had not yet been submitted by the end of the year. It was expected to provide a ten-year development program. In the election of March 14, the National party won 12 of the 21 seats in the legislative council, the Hindustani party 6, the Javanese 2. The cabinet was headed at the end of the year by J. A. E. Buiskool. (*See* also NETHERLANDS ANTILLES.) (C. ME.)

Education.—On Jan. 1, 1950, there were 118 elementary schools with 30,381 pupils and 768 teachers, 10 higher elementary schools with 2,866 students and 106 teachers and 1 secondary school with 18 students.

Finance.—The monetary unit is the Surinam guilder, valued at $0.530264 U.S. currency, official rate in 1951. The 1951 budget estimated expenditure at 27,863,000 guilders and revenue at 27,895,000 guilders. Actual revenue in 1950 was 26,829,000 guilders.

Trade and Communications.—Exports in 1950 totalled 31,477,145 guilders; imports were 39,814,281 guilders. Principal customers were the U.S. (80%) and the Netherlands (7%); the chief suppliers were the U.S. (42%), the Netherlands (28%), Trinidad (7%), the United Kingdom (6%) and Canada (3%). Important exports included bauxite (about 70%), rice, citrus fruit, timber, gold, balata and coffee.

Internal transportation is largely by water; in 1950 there were 83 mi. of railway and about 250 mi. of roads. Motor vehicles at the end of 1949 included 908 automobiles, 408 trucks and 127 buses. In 1948 there were 1,505 telephones and 500 mi. of wire.

Production.—The major economic activity is the extraction of bauxite, most of which is exported to the U.S. Production figures in 1950 included bauxite 2,302,705 short tons; gold 4,545 troy ounces; balata 196 short tons; sugar 3,181 tons; rice 55,587 tons; and coffee 478 tons. There were 43,000 cattle in 1949. (J. W. MW.)

Sweden. A democratic monarchy of northern Europe. Area: 173,390 sq.mi.; pop. (Dec. 1950): 7,047,000. Capital: Stockholm (pop. Dec. 31, 1949) 732,281. Other principal cities (pop. Dec. 31, 1949) were Göteborg 349,323; Malmö 189,391; Norrköping 84,228; Hälsingborg 71,263; Örebro 65,630; Uppsala 61,561. Religion: Lutheran Christian. Ruler in 1951: King Gustav VI Adolf. Prime minister in 1951: Tage Erlander.

History.—The debate on Sweden's "alliance-free" policy was intensified in 1951. The majority of Swedes seemed to approve participation in the United Nations and for this reason many questioned the government's hypercautious attitude in the United Nations on such questions as Chinese trade.

In the autumn of 1951 the Swedes were shocked by revelations of espionage within their own ranks. On Sept. 29 a chief petty officer of the Swedish navy, Ernst Hilding Andersson, confessed that for two years he had been gathering and transmitting information for the U.S.S.R. The security police had intercepted his report on the Karlskrona naval base, intended for W. Orlov of the soviet embassy. Orlov's recall was demanded immediately, and Andersson was tried and sentenced to life imprisonment.

Even before the espionage cases the government had raised its defense appropriations to unprecedented heights. The total for 1951–52 was estimated at 1,380,000 kronor ($266,400). This represented from 5% to 6% of the total national production and 20% to 25% of the national budget.

Inflation was a serious danger, and revaluation of the krona was repeatedly suggested—and refused. Wage increases for about 1,000,000 organized workers averaged 16.6% by May 1, when the major agreements were concluded. But the cost of living index had risen 19% since the outbreak of the Korean war. People dependent on social welfare benefits felt a decline of 20% since 1947 in the real value of their grants. For workers, however, real wages had increased 30% since 1939.

PRINCESS SIBYLLE of Sweden handing an award to 17-year-old Mona-Lisa Englund, chosen sportswoman of the year at a festival in the Royal Tennis hall, Stockholm, early in 1951

Since 1945 the Social Democrats had guided the government, but in 1951 demands for a coalition increased. The Socialists had only 112 of 230 members in the second chamber, and 79 out of 150 in the first chamber. At last the leading party yielded and on Oct. 1 created a government in coalition with the Farmers Union (Agrarians). Most notable in the general shift was the retirement of Gustav Moeller, "father of the Swedish social security system." Another significant replacement was the appointment of Torsten Nilsson, formerly minister of communications, as defense minister to replace Allan Vougt.

Coalition with the Agrarians added 30 votes to the government side in the second chamber and 25 in the first chamber, giving a clear working majority in each house. But it was yet to be seen whether the Farmers and the Socialists could pull together consistently. One basic difference was hard to reconcile: farmers wanted high agricultural prices and low industrial prices; the labourers' immediate interest was just reversed. All parties watched such issues, conscious of the general elections scheduled for the fall of 1952.

Problems of the Baltic and its border peoples were more acute than usual in 1951. In July Sweden joined Denmark in a request to Moscow that the soviet claim for a 12-mi. limit off its Baltic shores be submitted to The Hague for adjudication; at the end of August the U.S.S.R. rejected the plea, asserting that it had the sole right to set its own limits. Repeated landings of refugees from Poland and the Baltic states brought Russian demands for return of the fugitives, but Sweden maintained its right of asylum. By the autumn the Balts who had fled to Sweden in 1944 had fulfilled the required seven years of residence and could apply for citizenship; it was expected that about 20,000 of the 25,000 still in Sweden would do so. Another 5,000 had emigrated to Canada, the United States and South Africa.

On May 19 a new law on religious dissenters was passed, the result of 40 years' agitation. It made easier an individual's renunciation of Lutheranism, permitted establishment of monasteries and convents and approved marriage by ministers of other than the state church. (F. D. S.)

Education.—Schools (1950): elementary 28,850, pupils 611,869, teachers 20,093; secondary 404, pupils 134,843, teachers 7,822; technical, pupils 147,359; teachers' colleges 29, students 6,512, professors and lecturers 1,102. Universities 4 and institutions of higher education 12, students 11,142, professors and lecturers 1,484. Illiteracy: nil.

Finance and Banking.—Budget: (1950–51 actual) revenue 5,821,000,000 kronor, expenditure 6,260,000,000 kronor; (1951–52 est.) revenue 6,406,000,000 kronor, expenditure 6,650,000,000 kronor. National debt (Jan. 1950) 12,055,000,000 kronor. Currency circulation (Oct. 1951) 3,755,000,000 kronor. Gold reserve (Sept. 1951): 664,000,000 kronor. Deposit money (July 1951): 3,400,000,000 kronor. Monetary unit: krona (pl. kronor) with an exchange rate (Dec. 1951) of 5.18 kronor to the U.S. dollar.

Foreign Trade.—(1950): Imports 6,101,000,000 kronor, exports 5,710,000.000 kronor.

Transport and Communications.—Roads (1951): 90,474 km. Motor vehicles licensed (Jan. 1951): cars and buses 260,049, trucks 84,904. Railways (1951): 16,516 km.; passenger traffic (1950), 6,252,000,000 passenger-km.; freight traffic (1950) 8,016,000,000 ton-km. Shipping (Jan. 1951): number of merchant vessels 2,202; total tonnage 2,135,183 gross tons. Air transport (1950): km. flown 10,764,000; passenger-km. 223,692,000; cargo net ton-km. 6,768,000. Telephone subscribers (1950): 1,591,473. Radio receiving set licences (1951): 2,153,000.

Agriculture.—Main crops (metric tons, 1951): wheat 484,000, barley 250,000, oats 820,000, rye 176,000, potatoes (1950) 1,734,000. Livestock (Sept. 1950): cattle 2,648,000; sheep 279,000; pigs (1949) 1,238,000; horses 440,000; poultry (1949) 8,204,000. Fisheries (salt): total catch (1949): weight 182,419 metric tons; value 104,000,000 kronor.

Industry.—Industrial establishments (1948) 17,491; persons employed 666,344. Fuel and power: electricity (1950) 18,348,000,000 kw.hr. Raw materials (metric tons, 1950): iron ore 13,728,000; pig iron 784,800; crude steel 1,440,000. Manufactured goods (metric tons): cement (1950) 1,944,000; wood pulp (1949) 2,886,000. Timber (1949) 5,250,000 cu.m.

Swimming.

The London *Daily Mail's* second annual swimming contest across the English channel was held in Aug. 1951. Eighteen of twenty starters survived the exhausting trip from France to England. Hassan Hammad of Egypt, a 34-year-old member of King Farouk's bodyguard, was first to complete the route in 12 hr. 12 min., landing one minute ahead of Roger le Morvan of France, who had also been second in 1950. Brenda Fisher of England, 23, led the women in 12 hr. 42 min. and broke the women's record of 13 hr. 23 min., set by Florence Chadwick of the United States. Later in the season Miss Chadwick became the first woman to have spanned the channel from either side by swimming from England to France in 16 hr. 19 min.

Ford Konno, 18, of Hawaii, swimming in a 100 m. pool at Honolulu, covered 200 m. free style in 2 min. 8.8 sec., 400 m. in 4 min. 34.8 sec., 800 m. in 9 min. 30.7 sec. and 1,500 m. in 18 min. 25.6 sec. Only the time for 800 m. bettered the world record officially, but if the gain afforded by the racing turns were estimated, all four of these feats would be materially faster than the listed standards of 2 min. 4.6 sec., 4 min. 26.9 sec., 9 min. 35.5 sec. and 18 min. 19 sec. Allowing for the differences in length of course, in fact, Konno's marks represented an approximate pace of 2 min. 1.8 sec., 4 min. 20.8 sec., 9 min. 22.7 sec. and 18 min. 10.6 sec. under the conditions prevailing when the records were set.

John B. Marshall, a Yale university student from Australia, clipped three standards officially, dropping the free style marks for 400 m. to 4 min. 27.9 sec., 440 yd. to 4 min. 28.1 sec. and 500 m. to 5 min. 43.7 sec. U.S. fours cut the relay times for 400 yd. to 3 min. 21.6 sec., 400 m. to 3 min. 47.9 sec. and 800 yd. to 7 min. 40.6 sec, while a French quartet lowered the relay figures for 800 m. to 8 min. 33 sec. L. Meshkov of the U.S.S.R. and H. Klein of Germany brought down the breast stroke marks for 100 m. to 1 min. 6.6 sec. and 200 m. to 2 min. 27.3 sec.

In the women's field Gretjen Wielema of the Netherlands reduced the record for 150 yd. back stroke to 1 min. 40.4 sec., and Dutch trios sliced those for the 300 yd. and 300 m. medley relays to 3 min. 19.4 sec. and 3 min. 35.9 sec.; Hungarian girls bettered breast stroke standards, E. Szekely shaving the time for 100 m. to 1 min. 16.9 sec. and E. Novak that for 200 yd. and 200 m. to 2 min. 34 sec. and 2 min. 48.5 sec.

H. Furuhashi of Japan, international free style topnotcher in 1949, turned in two sparkling feats in the national championships, thrashing 200 and 400 m. in 2 min. 8 sec. and 4 min. 38.8 sec. in a 50 m. pool.

The Pan-American games were held in Buenos Aires, Arg., and U.S. entrants garnered premier aquatic laurels, winning four events for men and six for women. The first Mediterranean games took place at Alexandria, Egy., with the competition con-

Switzerland. A republican confederation of 22 cantons in west central Europe, Switzerland is bounded west by France, north by Germany, east by Austria and Liechtenstein and south by Italy. Area: 15,940 sq.mi. Pop.: (1950 census) 4,714,992. Languages: German 72.6%; French 20.8%; Italian 5.2%; Romansch 1.1%. Religions: Protestant 57.6%; Roman Catholic 41.1%; Jewish 0.5%. Chief towns (pop., 1946 est.): Berne (cap., 136,700); Zurich (360,500); Basle (170,300); Geneva (137,600); Lausanne (99,300). President of the confederation for 1951: Eduard von Steiger; vice-president of the federal council (government): Karl Kobelt.

History.—Switzerland appeared to be increasingly prosperous during 1951, for the industrial boom and the expansion of foreign trade, the first signs of which had become evident in Aug. 1950, continued. Nevertheless, the unsolved problem of the year was to find the money to finance the rearmament program approved by the parliament in Oct. 1950. Many schemes were brought forward, and after the elections of Oct. 28 the federal council in November went back to the recommendation of a plan put forward in February which involved heavy taxes on luxury foods and on drinks, but this was opposed by the powerful hotelkeepers' interest and was again shelved by a parliamentary commission. Meanwhile, prices and, with them, administrative and military costs were rising, so that at the end of the year a budget was brought forward for 1952 which envisaged a deficit of 250,000,000 Fr.

The elections to the council of nationalities were held on Oct. 28; on the same day most of the cantons elected or re-elected their representatives in the council of states. There were even fewer changes than had been foreseen. For the Communist party (called the Partei der Arbeit or Parti Ouvrier Populaire), which had been expected to disappear except in Geneva, was reduced—by the loss of two seats in the Vaud canton—only from seven to five. The three large parties—Radical, Catholic Conservative and Social Democrat—were returned, respectively, with 51, 48 and 49 representatives as against 52, 44 and 48 in the previous parliament, while the smaller but important Peasant party increased its seats from 21 to 23. (Because of the increase of population to 4,714,992 officially recorded in the census taken on Dec. 1, 1950, the number of parliamentary seats was increased from 194 to 196). The smaller parties virtually disappeared, with the exception, not only of the Communists, but also of the so-called Landesring der Unabhängigen, the followers of the erratic Gottlieb Duttweiler, owner of a chain of stores. While this independent party increased its seats in the council of nationalities from eight to ten, its leader, who had been elected to represent the canton of Zurich in the council of states in Sept. 1949, was defeated by a radical, Ernst Vaterlaus. Zurich had hitherto been regarded as Duttweiler's stronghold and he barely succeeded in saving his face by taking one of the council of nationalities seats won by his party in Berne.

After the election the two in some ways most prominent federal councillors (or ministers) resigned. One was the outgoing president of the confederation, a member of the Peasant party and minister of justice and police, Eduard von Steiger, who had held office since 1940. The other was the minister of finance, Ernst Nobs, the first Social Democrat to become a federal councillor (in 1943). They represented respectively Berne and Zurich, the two most important cantons. When the new federal assembly (council of nationalities sitting with the council of states) met in December it elected as their successors Markus Feldmann (Berne, Peasant party) and Max Weber (Zurich, Social Democrat). On the same day Karl Kobelt was elected president of the Swiss confederation for 1952 and Philip Etter vice-president of the federal council.

Toward the end of November the federal council brought a case against Pierre Nicole, son of Léon Nicole, the president of the Swiss Communist party. Pierre Nicole had published articles abroad accusing the federal council of abandoning Swiss neutrality by associating the country with the "aggressive" United States and the western anti-Communist bloc; he was condemned to 15 months' imprisonment for calumny and for undermining the independence of his country.

Education.—Schools (1948–49): primary, pupils 434,498, teachers 14,136 (5,460 women); secondary and lower middle, pupils 78,587 (girls 36,266), teachers 3,275 (women 427). Universities (1949–50) 7, students 14,903, professors and lecturers 1,379; institutions of higher education 2, matriculated students 3,957, teachers 453.

Finance and Banking.—Budget: (1950 est.) revenue 1,622,000,000 Fr., expenditure 1,466,000,000 Fr.; (1951 est.) revenue 1,577,000,000 Fr., expenditure 1,901,000,000 Fr. National debt (Dec. 1950): 11,176,000,000 Fr. Currency circulation (Sept. 1951): 4,919,000,000 Fr. Bank deposits (Aug. 1951): 6,927,000,000 Fr. Gold and foreign exchange (Sept. 1951): 1,425,000,000 Fr. Monetary unit: franc, with an exchange rate of 4.36 Fr. to the U.S. $1.

Foreign Trade.—(1951) Imports 5,900,000,000 Fr.; exports 4,600,000,000 Fr. Main sources of imports (1950): U.S. 13.8%; France 11.3%; Germany 11.0%; U.K. 8.1%. Main destinations of exports: U.S. 13.2%;

Italy 13.2%; Germany 9.3%; France 9.2%. Main imports: machinery 4.5%; coal 4.1%; fruit and vegetables 4.1%; raw cotton 3.8%; cars 3.7%. Main exports: machinery 22.1%; watches 18.7%; instruments and apparatus 6.6%; paint 5.7%; cotton fabrics 3.2%.

Transport and Communications.—Roads (1949) 10,250 mi. Licensed motor vehicles (Dec. 1950): cars 146,998, commercial 41,514. Railways (1949): total 3,345 mi.; state 1,812 mi.; passenger-miles (1950) 3,356,000,000; freight, ton-miles, 1,215,000,000. Shipping (1951): number of merchant vessels 20; total tonnage 100,000 tons; freight handled (1949) 2,252,020 metric tons. Air transport (1950): passenger-miles 91,487,000; cargo net ton-miles 2,450,000. Swissair traffic (1950): passengers flown 196,625; freight carried 2,349 metric tons; mail carried 1,554 metric tons; miles flown 5,618,309. Telephones (1950): subscribers 574,400. Radio receiving sets (1949): 986,679.

Agriculture.—Main crops (metric tons, 1951): wheat 207,000; rye 32,000; barley 46,000; oats 55,000; sugar, raw value (1950) 28,000; potatoes (1950) 1,130,000. Wine production (1950) 720,000 hl. Livestock (April 1950): cattle 1,530,000; pigs 908,000; goats 180,000; sheep 180,000; horses 134,000; chickens (April 1951) 6,268,000; geese, ducks and turkeys 85,000. Meat production (1950) 69,600 metric tons. Dairy produce (1950): butter 18,800 metric tons; cheese 52,100 metric tons.

Industry.—Industrial establishments (1950): 11,568; persons employed 492,563. Fuel and power: manufactured gas (1949) 299,000,000 cu.m.; electricity (1950) 9,120,000,000 kw.hr. Index of industrial activity (1938=100; 1950) building 116; cotton 99.5; silk 119.5; embroidery 108; metals 136; watchmaking 123; chemicals 162; foodstuffs 129. Index of employment in manufacturing (1937=100; 1950) 125.

Syria.

An independent Arab republic, formerly under French mandate, Syria is bounded by the eastern Mediterranean, Turkey, Iraq, Jordan, Israel and Lebanon. Area: 72,200 sq.mi. Pop.: (1938 census) 2,930,107, including the inhabitants of Hatay, ceded to Turkey in 1939; (1950 est.) 3,516,000. Language: Arabic is the mother tongue of about 86% of the population, but Kurdish, Armenian, Turkish and Circassian are also spoken. Religions: Moslem 82% (mainly Sunni Arabs); Christian 14%; other 4% (Druze, Jewish, Yezidi, etc.). Chief towns (pop., 1947 est.): Damascus (cap. 312,000); Aleppo (331,000); Homs (109,000); Latakia (90,000); Hama (80,000). Presidents in 1951: Hashem el Atassi and (from Dec. 3) Col. Fawzi Silo. Prime ministers: Nazim el Kodsi; (from March 27) Khalid el Azam; (from Aug. 9) Hassan Hakim; and (on Nov. 28, for nine hours) Maruf ed Dawalibi.

History.—Early in Jan. 1951 there was the first resumption of internal trade between Syria and Lebanon since Syria's denunciation of the Lebanese-Syrian customs union in March 1950; but in June it was reported that resumed negotiations for the re-establishment of the union had broken down. Meanwhile, local Syrian development projects were being pursued such as the reclamation of the Ghab valley in the northeast of the country and the development of cotton cultivation in the Euphrates valley, while in April bids were invited for the improvement of the port of Latakia and for the building of a railway from there to Aleppo. In March there arose serious Israeli-Syrian tension in the upper reaches of the Jordan river, where Israel claimed the right to extend its drainage work in the Lake Huleh swamps while the Syrian authorities asserted that, as the area was part of the demilitarized zone between the two countries, no work of this nature could be undertaken without their approval. There followed a series of clashes between the frontier posts on both sides and on April 5 the Israelis bombed a Syrian frontier position. These outbreaks brought the Arab League into action with offers of assistance from Saudi Arabia, Lebanon and Iraq, while the Syrian chief of staff proceeded to Cairo to consult Egyptian army authorities. Clashes of varying intensity continued through April and the first week in May when the U.N. Security council, whose services had been solicited by both parties, stepped in, and on May 15 both Syria and Israel agreed to cease hostilities.

In March, Nazim el Kodsi, who had been prime minister for seven months, resigned, and Khalid el Azam succeeded him. In July, however, he in his turn resigned following a strike of government employees against his labour policy. He was succeeded by Hassan Hakim.

In September Syria, with the other Arab delegates, rejected the proposals put forward by the U.N. Conciliation Commission for Palestine for a settlement. In October, after the abrogation by Egypt of the Anglo-Egyptian treaty of 1936 and of the Sudan condominium convention of 1899, Syria expressed its support of the Egyptian action. Later in the month there were anti-British demonstrations in Damascus. Meantime, the proposals for the organization of a middle east command had been rejected by Egypt, and on Oct. 23 the Syrian foreign minister, Faydi Atassi, denounced the four-power proposals. In November, however, the prime minister, Hassan Hakim, in a newspaper interview, announced his approval of Syrian participation in the four-power defense scheme and criticized Egypt for not having consulted the other members of the Arab league before its rejection of the four-power offer. On Nov. 10 the prime minister resigned, giving as his reasons the differences within the cabinet as to Syrian participation in the four-power scheme. He also sent a letter to the president of the Syrian chamber of deputies, affirming his support of the defense plan and of the U.S. mutual aid program, which, he stated, would strengthen the economic and military position of Syria and enable the country to resist Israeli aggression. In November the soviet government, in a statement to all members of the Arab league, warned them against the four powers' defense plan, which, it asserted, would forfeit them soviet friendship and ultimately lead to their loss of independence.

After Hakim's resignation and a three-week ministerial crisis, Maruf ed Dawalibi, the leader of the People's party, succeeded in forming a cabinet on Nov. 28. As he appointed himself defense minister and therefore showed his intention of controlling army and police, he was overthrown by the army nine hours after his nomination. The coup d'état was engineered by Col. Adib el Shishakly, chief of the general staff. On Dec. 2 President Atassi resigned. On Dec. 3 the higher military council, headed by Shishakly, appointed Col. Fawzi Silo as chief of state, prime minister and minister of defense. (O. M. T.)

Education.—Schools (April 1951): elementary 1,759, including private 228, foreign 38; total elementary pupils 260,759, including private 48,817, foreign 6,715; secondary 136, including private 69, foreign 18; total secondary pupils 28,595, including private 10,127, foreign 2,227. (1950) Technical schools 8 (including 2 private); university 1.

Finance and Banking.—Budget: (supplementary est., January-June 1951) balanced at L.S. 67,800,000; (1951–52 est.) balanced at L.S. 197,000,000. Currency circulation (April 1951) L.S. 225,000,000. Monetary unit: Syrian pound, with an exchange rate (Nov. 1951) of L.S. 2.20 to the U.S. $1.

Foreign Trade.—The Lebanese-Syrian customs union was terminated in March 1950. (April-December 1950): imports L.S. 198,000,000; exports L.S. 207,900,000.

Transport and Communications.—Roads (1950): 9,740 mi., of which 3,021 mi. are usable all the year. Licensed motor vehicles (Dec. 1950): cars 4,172; commercial 5,476. Railways (1949): 539 mi. Telephones (1948): 6,200. Radio receiving sets (1950 est.): 50,000.

Agriculture.—Main crops (metric tons, 1950): wheat 889,000; barley 357,000; maize (1948) 39,000; oats 5,000; potatoes (1948) 15,000; rice (1948) 20,000; cotton, ginned, 40,000; cottonseed 73,000. Fruit production (metric tons, 1950): grapes (1949) 150,000; olives 40,000; olive oil 5,000; oranges and tangerines 2,000. Livestock (Dec. 1949): sheep 2,750,000; goats 17,323,000; cattle 368,000; horses 98,000; donkeys (Dec. 1948) 245,000; mules 54,000; chickens (Dec. 1950) 2,171,000.

Industry.—Production: cotton textiles (1950 est.) 5,600 metric tons; natural and artificial silk textiles (1950) 26,700,000 m.; box calf and kidskin leather (1947) 29,000 sq.m.; salt (1947) 18,800 metric tons; cement (1950) 67,700 metric tons; asphalt (1947) 14,500 metric tons.

Table Tennis.

The 1951 world table tennis championships were played in Vienna, Aus., March 4 to 11; 35 nations took part in the tournament. The Swaythling cup was won by Czechoslovakia (Ivan Andreadis, Bohumil Vana, Y. Tereba). The Corbillon cup for women's teams was won by Rumania (Angelika Roseanu, Sari Szasz); men's singles by Johnny Leach (England); women's singles by Angelika Roseanu (Rumania); men's doubles, Ivan Andreadis and Bohumil Vana (Czechoslovakia); women's doubles, Rosalind and Diana Rowe (twins, England).

The 21st U.S. national table tennis championships were played at St. Louis, Mo., April 6–8, 1951. The following were the winners: men's singles, Richard Miles (New York city); women's singles, Mrs. Leah Neuberger (New York city); junior miss singles, Sharon Koehnke (Glen Ellyn, Ill.); boys' singles, Al Holtmann (St. Louis, Mo.); senior singles (35 or over), Tibor Hazi (Washington, D.C.); esquire singles (50 and over), Paul Jackson (Providence, R.I.); men's consolation, Alexander Hayday (Minneapolis, Minn.); women's consolation, Arlyn Shapiro (Los Angeles, Calif.); men's doubles, William Holzrichter (Chicago), M. Reisman (New York city); mixed doubles, L. Neuberger and Doug Cartland (New York city); senior doubles, Bill Gunn and Tibor Hazi (New York and Washington, D.C.).

English open championships played at Wembley, London, Nov. 28 to Dec. 2, 1950, produced the following champions: men's singles, A. Ehrlich (France); women's singles, Trudi Pritzi (Austria); men's doubles, Jack Carrington, Johnny Leach (London); women's doubles, Rosalind Rowe and Diana Rowe (England); mixed doubles, Victor Barna (England), Helen Elliot (Scotland).

The finals of the first U.S.S.R. championships were held in Moscow in November. The tournament was played on all-play-all system, winners being placed in order of results. Vilius Variskojis (Lithuania) won the men's title and Ona Zalivicute took the women's crown.

In the Canadian national championships, played at Toronto, Ont., Sept. 6, 7 and 8, the winners were as follows: men's singles, M. Reisman (New York city); women's singles, Mrs. Leah Neuberger (New York city); men's doubles, M. Reisman and M. Silvert (New York city); women's doubles, L. Neuberger and Jessop (Toronto); mixed doubles, L. Neuberger and Sol Schiff (New York city); junior miss, Sharon Koehnke (Glen Ellyn, Ill.); junior boys' singles, Bobby Gusikoff (New York city). In team matches the United States defeated Canada 6 to 0. (P. W. R.)

Taft, Robert Alphonso

(1889–), U.S. senator, was born on Sept. 8 in Cincinnati, O., the son of William Howard Taft, 27th president of the U.S. He graduated from Yale university, New Haven, Conn., in 1910, and from the Harvard law school in 1913. During World War I he served as assistant counsel of the U.S. Food administration, and after the war he helped organize relief services to Europe. He served in both houses of the Ohio legislature, and was elected to the U.S. senate in 1938 and re-elected in 1944 and 1950. He was a strong contender for the Republican nomination for the presidency in the 1940, 1944 and 1948 national conventions.

Throughout 1951 Taft was a leading critic of Pres. Harry S. Truman's foreign policy, and of most of his domestic policy as well. On Jan. 5 he declared that the president had not the right to send troops to Korea without the consent of congress. He held similarly that a limit should be imposed on the number of U.S. troops that could be committed to the defense of Europe. He declared that attempting to halt communism by ground forces in Asia was futile, and advocated the use of superior air and naval power instead. Urging that the nationalist Chinese on Formosa be given full U.S. support, he charged that the policies of Secretary of State Dean Acheson would ultimately turn both Korea and Formosa over to red China.

Taft was rated as a strong contender for the 1952 Republican presidential nomination and late in the year began stumping the U.S. for delegates to the 1952 convention.

Talal I

(1909–), King of Jordan, was born at Mecca. He succeeded his father King Abdullah who was murdered in Jerusalem on July 20. He received the education customary in a ruling Arab family and, after the setting up of the emirate of Trans-Jordan in close relationship with Great Britain, was sent to the Royal Military college, Sandhurst. In later years he took little part in affairs of state. He went to Beirut for treatment in June 1951 and afterwards left for Geneva to continue treatment there. The Emir Naif, Talal's younger brother, accepted the regency on his father's death on July 20 until his brother could return. Talal summoned Said Pasha el Mufti, minister for the interior, to Geneva on Aug. 7. By Aug. 25 Talal's health was pronounced restored. On Sept. 5 both houses of the Jordanian parliament proclaimed him king. He reached Amman by air the following day and took the oath. He stated that he intended to maintain the same friendly relations with Britain as his father had done. King Talal visited Saudi Arabia in November as the guest of the Emir Faisal. (R. JAN.)

Tangier.

Tangier has been, since 1912, an international and demilitarized zone of Morocco on the southern shore of the Straits of Gibraltar. Area: 232 sq.mi. Pop. (mid-1950 est.): 111,000 including 30,000 Europeans. Languages: Arabic, French and Spanish. Religion: mainly Moslem. On Oct. 11, 1945, the international administration was re-established with a committee of control composed of the resident consuls general of France, Great Britain, the United States, the U.S.S.R., Belgium, the Netherlands, Portugal and Spain. The soviet representative refused to take his seat on the committee as long as Franco Spain was represented. Italy was readmitted to the committee on March 8, 1949. The committee of control appoints a legislative assembly of 26 members (4 French, 4 Spanish, 3 British, 3 U.S., 1 Belgian, 1 Dutch, 1 Portuguese, 3 Jewish and 6 Moslem). Tangier remained under the nominal sovereignty of the sultan of Morocco, and his representative (the *mendoub*) was Hadj Mohammed el Tazi.

It was announced on July 25, 1951, that Jonkheer H. L. F. C. van Vredenburch (Netherlands) had terminated his three-years appointment as administrator and was succeeded by Jose Luis Archer, the Portuguese resident consul general.

History.—Allal el-Fassi, leader of the Moroccan Istiqlal (Independence) party, was arrested on March 9 to face charges before the mixed tribunal of spreading false rumours about the French policy in Morocco. Habib Bourguiba, leader of the Neo-Destour (New Constitutional) party of Tunisia, was banned on Nov. 2 from the international zone when he was conferring with Moroccan Nationalist leaders. Banking authorities estimated that about 50,000 kg. of gold worth more than $60,000,000 was stacked away in vaults of the tax-free city of Tangier.

Tariffs.

Three principal developments characterized world tariff history during 1951. Probably the most important of these was the further expansion of the General Agreement on Tariffs and Trade as a consequence of the Torquay conference. The second most noteworthy trend was adoption of new tariffs by a substantial number of countries. In contrast with these two rather comprehensive developments was the fact that minor tariff changes affecting duties on individual import items were much less in evidence than in previous years.

The Torquay Conference.—The Torquay Tariff conference, which had been in session since Sept. 1950, came to a close in April 1951. This terminated the third set of multilateral tariff negotiations sponsored by the member countries (contracting parties) of the General Agreement on Tariffs and Trade (G.A.T.T.). The first of these negotiations was held at Geneva, Switz., in 1947 and the second at Annecy, Fr., in 1949. At Torquay, Eng., as at Annecy, the contracting parties held a session during the conference to consider general issues under the agreement.

Thirty-four countries participated in the tariff negotiations at Torquay. Twenty-seven of them were already members of G.A.T.T., whereas seven—Austria, western Germany, Korea, Peru, the Republic of the Philippines, Turkey and Uruguay—were negotiating with a view to accession. One of these, Uruguay, had also participated in the Annecy negotiations, but had not yet acceded to the general agreement. As at Geneva and Annecy, the negotiations were conducted on a bilateral basis between pairs of countries. At Torquay, 147 such bilateral negotiations, ultimately involving 8,700 individual concessions, were completed; nearly three-fifths of these bilateral negotiations were between G.A.T.T. members and acceding countries; virtually all the remainder were between pairs of G.A.T.T. members. Compared with the aggregate of tariff concessions previously negotiated at Geneva and Annecy, those granted at Torquay were of relatively small importance, both in terms of the number of items negotiated and trade coverage. The Torquay conference, nevertheless, broadened the total trade coverage of the general agreement and established a working basis for the accession of seven more countries. By the close of the year all the aforementioned countries except Korea, the Philippines and Uruguay had signed the Torquay protocol and thereby entered into full membership in the general agreement.

At Torquay the contracting parties agreed to extend for three years the period of "firm validity" for the Geneva and Annecy concessions (except those modified or withdrawn at Torquay under article 28 of G.A.T.T.; *see* below). Thus, the contracting parties agreed that most of the Geneva and Annecy concessions, as well as the Torquay concessions, could not be modified or withdrawn before Jan. 1, 1954, without joint action by the contracting parties. As a result of the Torquay conference, therefore, import duties applicable to a large portion of world trade were stabilized, at least until 1954.

Reversals under G.A.T.T.—Until 1951 the countries participating in the General Agreement on Tariffs and Trade had made rather constant step-by-step progress toward the reduction of world tariff barriers. In 1951, however, certain developments resulted in measures which, directly or indirectly, offset in part the further progress attained at Torquay.

An important phase of the Torquay conference was the so-called article 28 negotiations. Under that article of the general agreement, individual G.A.T.T. members were permitted to modify or withdraw any of their Geneva or Annecy tariff concessions after Jan. 1, 1951, without joint action by the contracting parties. Sixteen countries availed themselves of this privilege at Torquay; they were the Benelux customs union, Brazil, Chile, Cuba, Denmark, Finland, France, Haiti, Italy, New Zealand, Sweden, the Union of South Africa, the United Kingdom, and Uruguay. As a consequence, 295 concessions were withdrawn or modified. To offset the loss of benefits to the other participating countries, the aforementioned 16 countries granted compensatory concessions on other commodities; presumably, therefore, there was no diminution in the over-all level of tariff concessions in the general agreement as a result of action under article 28.

Following the dissolution of their customs union, Lebanon withdrew from the general agreement in Feb. 1951 and Syria in Aug. 1951. The Chinese nationalist government had previously withdrawn. By the close of 1951, therefore, the bulk of the concessions made by and to China, Lebanon and Syria in the general agreement were no longer in effect.

In Nov. 1951 the United States and Czechoslovakia, both contracting parties, suspended the application of all trade-agreement concessions to imports from one another. The action by the United States was one of several taken to administer section 5 of its Trade Agreements Extension Act of 1951. That section directed the president to suspend, as soon as practicable, the application of all trade-agreement concessions to imports from Communist-dominated countries or areas. During the last five months of 1951, therefore, the United States made such suspensions effective as rapidly as was commensurate with its international commitments; it announced, however, that suspension of concessions on imports from the U.S.S.R., Poland and Hungary would not be effective until 1952, inasmuch as commercial treaties according most-favoured-nation treatment to those countries could not be terminated until then. As a result of these suspensions, the United States now had, in effect, a two-column tariff on a great many items: a trade-agreement rate applicable to imports from most countries and a higher rate —usually that originally specified in the Tariff Act of 1930—applicable to imports from most Communist-dominated areas.

The United States Trade Agreements Extension Act of 1951, which extended the authority of the president to negotiate trade agreements for a period of two years, became law in June 1951. While not changing a previous statute limiting reductions in duties to 50% of the 1945 rate of duty, the act contained several features which, in a sense, circumscribed the freedom of the president to grant tariff concessions or to maintain them in effect. First, the act included so-called peril-point provisions similar to those in the extension act of 1948. Those provisions required the United States tariff commission to report to the president, for each item listed for consideration in pending trade-agreement negotiations, the maximum concessions which could be made without causing or threatening serious injury to a domestic industry. If in concluding an agreement the president exceeded the "peril point" on any item, the law further provided that he must report that fact to the congress and that the tariff commission would thereby be required to transmit to the congress the section of its report dealing with that item. Second, the act directed that an "escape clause" be included in all future trade agreements and, as soon as practicable, in all existing trade agreements. Insertion of the escape clause in trade agreements had been a matter of executive policy rather than legislative directive. Third, as discussed above, the act required the president to suspend the application of all United States trade-agreement concessions to imports from the Soviet Union and Communist-dominated countries.

General Revisions of Schedules or Nomenclatures.—The trend toward comprehensive tariff revisions continued in 1951. World War II and the unsettled postwar years had constituted somewhat of a standstill period insofar as tariff revisions were concerned. In view of the time which had elapsed, therefore, three factors, among others, ultimately contributed to the need for revision of either schedules of import duties or tariff classifications by various countries. These were (1) the world-wide rise in prices, as well as the currency depreciation in individual countries, which seriously impaired the revenue and protective capacity of tariffs based principally on specific-type duties; (2) the changing composition of the import trade of many countries, together with the appearance in world trade of many new commodities (such as plastics, synthetic fabrics and antibiotics), which necessitated either the revision or modification of existing import classifications; and (3) the appearance of the "Brussels tariff nomenclature," which provided an additional impetus to countries considering replacement of outmoded tariff classifications with the more scientific model nomenclature originally sponsored by the League of Nations. In 1951, Brazil, Colombia, Costa Rica, Ecuador, El Salvador, Germany and Iran adopted, or were in process of adopting, new tariffs.

Brazil.—In August the Brazilian government created a commission to draft a new tariff. It appeared from the executive order authorizing the projected revision that Brazil was chiefly interested in adjusting rates of duty; increases in duties apparently were desired, not only to compensate for the decline which rising prices had caused in the revenue-raising capacity of Brazil's specific duties, but also to afford additional protection to domestic enterprises.

Colombia.—The revised tariff, officially described as "courageously protectionist," provided substantial increases in duty on manufactured products and smaller increases for semimanufactured articles; decreases in duty were provided for certain raw materials essential to Colombian processing industries.

Costa Rica.—A new schedule of duties, effective in October, was described as an "interim revision" to serve until a more comprehensive revision, then in project, could be completed. The interim tariff made only minor changes in the nomenclature previously employed; the principal modifications in the old tariff were increases in rates of duty.

Ecuador.—Early in 1951 Ecuador released a projected tariff which had been under consideration for some time. The new schedule, prepared in consultation with a United Nations mission, was scheduled to be placed in effect early in 1952. The projected tariff made almost exclusive use of specific rates of duty.

El Salvador.—Another tariff revision in project, but not completed at the close of 1951, was that initiated in El Salvador. As in Ecuador, this work was undertaken in consultation with a United Nations mission.

Germany.—The Federal Republic of Germany put into effect its new tariff in Oct. 1951. The schedule consisted primarily of ad valorem rates of duty, and the highest rate was reported to be 35%.

Iran.—Late in 1950 Iran introduced a new tariff with nomenclature which followed closely the League of Nations model. Although the new schedule of rates, like the preceding schedule, consisted largely of specific duties, ad valorem rates were employed more frequently than formerly.

(*See* also EUROPEAN RECOVERY PROGRAM; INTERNATIONAL TRADE.) (D. LH.; G. P. H.)

Taxation.

Pres. Harry S. Truman's message to congress in Jan. 1951 sought an immediate tax increase of $10,000,000,000, to be divided as follows: $3,000,000,000 from corporations, $4,000,000,000 from individuals and $3,000,000,000 from excises. He also stated that later in the year he would seek an additional $6,500,000,000 to make up the $16,500,000,000 deficit forecast in the budget for the fiscal year 1952. However, the latter proposal met with immediate congressional hostility and was abandoned. The Revenue Act of 1951, implementing the president's recommendation, was finally adopted in October but failed by almost 50% to meet President Truman's stated revenue requirements.

"FIRST SERVED," a cartoon by Page published in 1951 in the *Louisville Courier-Journal* (Ky.)

This legislation had an indicated additional yield, on the basis of a full year's operations, of $5,691,000,000, the increase being allocated $2,280,000,000 to individual tax increases, $2,207,000,000 to increases in corporation income and excess profits taxes and $1,204,000,000 to increases in excise taxes. The aggregate increase of $5,691,000,000 made it the second largest tax bill in the country's history, being exceeded only by the $6,100,000,000 tax bill enacted in 1950. These two bills, taken together with the $3,900,000,000 tax increase effected by the Excess Profits Tax act of 1950, brought to $15,691,000,000 the tax increases, on a full year basis, enacted since the beginning of the Korean war. For the fiscal year ending June 30, 1952, the federal tax load was estimated to amount to approximately $61,000,000,000. Assuming state and local taxes of $18,000,000,000 and a national income of $290,000,000,000, this meant that 28% of the national income during fiscal 1952 would be taken by taxes.

During 1951 federal tax collections exceeded $50,000,000,000, the highest on record and 15% more than the previous high of $43,000,000,000 collected in wartime fiscal year 1945.

U.S. Legislation.—Individual income tax increases, which represented the most important source of additional revenue under the Revenue Act of 1951, took the form of an increase equivalent to approximately 11.75% of the tax payable under prior law. This change was made effective as of Nov. 1, 1951, so that the increase for the calendar year 1951 was approximately 1.96%.

Next in importance were changes in corporate income and excess profits taxes. Increases in this field were made retroactive to April 1, 1951, and consisted primarily of an increase in the rate of normal tax from 25% to 30%. The surtax rate of 22% on all income of more than $25,000 was left unchanged but the combined effective maximum rate of slightly less than 52% represented an all-time high for this type of tax. The 1951 act retained unchanged the excess profits tax rate at 30% of corporate net income computed after deducting the applicable excess profits credit. Changes were made in the structure of the excess profits credit by providing that when this credit was computed on the basis of the average earnings of the best three out of four years of the 1946–49 base period, only 83% of such average should be taken rather than 85% as previously. This amendment was made effective as of July 1, 1951.

Another important corporate tax change involved the determination of the ceiling on corporate tax liability. In 1950 a ceiling of 62% of corporate income (before any deduction for the appropriate excess profits credit) was imposed upon the aggregate liability of a corporation for income and excess profits taxes. The 1951 law abandoned the approach of a ceiling on all corporate taxes and imposed a new ceiling on excess profits taxes alone. This ceiling, effective as of April 1, 1951, was set at 18% of corporate income computed before the deduction of the appropriate excess profits credit. The effect of this new ceiling was to increase slightly the excess profits tax liability of any corporation affected by the ceiling rate.

The new law increased the maximum rate of tax on capital gains recognized by both individuals and corporations from 25% to 26% for taxable years beginning after Oct. 31, 1951.

In excise taxes, congress confined itself to the increase of preexisting and the imposition of several new selective items. The 1951 law imposed higher excise taxes on liquor, beer, cigarettes, gasoline, autos, auto parts, trucks and buses. New taxes were imposed for the first time on many appliances, on diesel fuel, cigarette lighters, mechanical pens and pencils. The previously existing tax on electrical energy sales was repealed and the tax rate on pipe and chewing tobacco, telegrams and photographic equipment was reduced.

The movement for placing co-operatives, building and loan associations and various so-called mutual organizations on a comparable tax basis with ordinary business organizations achieved its first legislative success in the Revenue Act of 1951. This act subjected mutual savings banks, building and loan associations, co-operative banks and federal savings and loan associations to corporate income (but not excess profits) taxes, beginning with 1952, but allowed deductions for dividends paid to depositors or credited to their accounts and for additions to bad debt reserves until surplus, undivided profits and reserves reached 12% of deposits. Farm co-operatives also were subjected to corporate income (but not excess profits) taxes, but only on that portion of their earnings not paid out as dividends on capital stock or allocated to patrons with respect to their patronage.

While the 1951 act was designed chiefly as a revenue raising measure, it contained a number of important relief provisions. Corporations which commenced business after July 1, 1945, were granted substantial excess profits tax concessions. Individuals were freed from capital gains tax liability in the case of profits from the sale of a residence if the proceeds of such sale were invested within a year in the purchase of a new residence. The rule with respect to the taxation of family partnerships was liberalized by providing, contrary to a number of court decisions under previously existing law, that a person with a capital interest in a family partnership where capital is a substantial income-producing factor, must be recognized as a partner even though he received his interest through a gift from another partner. Finally a provision which had not been in the law after 1934 was reinstated to the effect that no gain should be recognized from the receipt of stock in corporate exchanges known as "spinoffs." A "spinoff" occurs when a part of the assets of one corporation is transferred to a new corporation in exchange for its stock and the stock in the new corporation is distributed to the shareholders of the original corporation without a surrender by them of any of their holdings of the original corporation's stock.

Long-standing uncertainty with respect to the treatment for federal estate tax purposes of property subject to a power of appointment was dispelled with the passage on June 28, 1951, of the Powers of Appointment Act of 1951. This legislation followed a liberalizing trend in estate tax legislation which began in 1948 with legislation permitting reduction of the taxable estate for certain property passing to a surviving spouse and continued with the Technical Changes Act of 1949 and the provisions of the Revenue Act of 1950 limiting the circumstances under which the government could claim that *inter vivos* transfers were taxable as being made in contemplation of death. In substance the Powers of Appointment Act of 1951 provided that only those powers were taxable which permitted the power holder to appoint to himself, his creditors, his estate or the creditors of his estate.

U.S. State Taxation.—The trend of state tax collections which had been steadily upward after 1933 continued throughout the fiscal year 1951. Total collections for the year amounted to $8,900,000,000, up 12.6% from 1950 collections of $7,900,000,000 and more than double the 1945 collections of $4,300,000,000. Reflecting the general inflationary situation, the rate of annual increase in state revenues was accelerated during 1951, the $1,000,000,000 rise during the year being larger than the rise which had occurred in either of the two preceding years. These figures for state tax collections do not include pay-roll levies for unemployment compensation since these receipts were transferred by the U.S. department of commerce in 1951 from the category of tax revenue to that of insurance trust revenue.

Although general sales and gross receipts taxes were in force in only 29 states during the fiscal year, and in one of these states only for the final quarter of the year, such taxes continued as the largest source of state tax revenue both absolutely ($2,000,000,000), and relatively (more than one-fifth of total collections). Comparable figures for 1950 were $1,679,000,000 and 18.7%.

During the year sales and use taxes were imposed for the first time in Georgia, South Carolina and Maine, bringing to 31 the number of states imposing a sales tax. West Virginia inaugurated a new use tax and Alabama and Rhode Island increased the rates of their previously existing sales taxes. Running counter to the general trend, the South Dakota sales tax, which had been earmarked for the payment of the veterans' bonus, was terminated when tax collections had been received in a sufficient amount to finance the bonus payments.

The next ranking source was the sales tax on motor vehicle fuel, which provided $1,710,000,000, $166,000,000 or 10.7% more than in 1950. Seven states increased their gasoline tax rates during the year while two effected reductions.

Taken together, general and selective sales and gross receipts taxes yielded $5,269,000,000, or nearly three-fifths of the total collected from all state tax sources.

The third major tax group from the point of view of yield was net income taxes on individuals and corporations which produced $1,492,000,000, up 13.9% from the 1950 figure of $1,310,000,000.

Tax Treaties.—The year 1951 witnessed a substantial increase in the area covered by international treaties seeking to eliminate double taxation. At the beginning of the year income tax conventions were in effect with Denmark, the Netherlands and Sweden, while both income and estate tax treaties were in effect with Canada, France and the United Kingdom. On Sept. 17, 1951, the senate ratified income and estate tax conventions with the Union of South Africa, Norway, Ireland and Greece, and a supplemental income and estate tax convention with Canada. At the same time income tax conventions were ratified with Switzerland and New Zealand. A signed income tax convention with Belgium awaited ratification at the end of the year.

Canada.—On April 10, 1951, the minister of finance, Douglas Abbott, presented certain budget resolutions dealing with the personal income tax, the corporation income tax and various excise taxes. The principal change in the individual income tax involved a defense surcharge of 10% of pre-existing tax liability for the calendar year 1951 and 20% for succeeding years. A similar surcharge of 20% for the calendar year 1951 was recommended for corporations. It was also recommended that the right to charge depreciation be deferred for three years beyond the date of acquisition in the case of certain capital assets acquired after April 10, 1951, which did not contribute to the defense effort. Whereas the United States during World War II had permitted accelerated amortization of new construction directly connected with the defense effort. the minister's proposal for deferred depreciation represented a novel method of channelling scarce materials into the types of construction thought to be most in the national interest. The budget resolutions included an increase in the sales tax from 8% to 10%, the imposition of new special excises on certain household goods such as gas and electric stoves, washing machines and refrigerators and the increase in the excise on automobiles, household electrical appliances, jewelry, furs and radios. The cigarette tax was increased and that on candy and chewing gum decreased.

The Excise Tax amendments received royal assent on June 20, the changes contained therein being effective as April 11, 1951. On June 30, 1951, the income tax amendments received royal assent.

On Oct. 25, 1951, the minister of finance presented his recommendations for financing old-age pensions. They included an additional 2% on the personal income tax with a maximum of $60 a year, an additional 2% tax on corporate income and the earmarking of 2% of the existing sales tax for old-age security. The proposed increases were to come into effect on Jan. 1, 1952, in the case of the corporate tax and on July 1, 1952, in the case of the individual tax. Legislation carrying out these recommendations received royal assent on Dec. 21, 1951. (*See* also BUDGET, NATIONAL; CO-OPERATIVES; DEBT, NATIONAL; LAW.)

(J. DE.)

Tea. Apparent civilian consumption of tea in 1951 in the U.S. was seven-tenths of a pound per person, slightly more than the 1950 or pre-World War II rates. Imports continued at the high 1949–50 level. British consumption continued under a weekly ration of two ounces per person. Trading in Mincing Lane, London, closed from 1939, in April 1951 replaced government bulk buying and allocation. Retail prices, firm since 1939, advanced 20% in London in November.

Tea Exports from Principal Producing Countries

(In thousands of pounds)

Country	1950*	1949*	Average 1935–39
India	391,000	490,000	332,735
Ceylon	289,099	297,573	221,568
Indonesia	69,873	52,743	153,175
China	25,000	20,000	79,483
Japan	15,944	16,049	43,280
Pakistan	15,935	27,265	†
Nyasaland	15,157	12,770	8,834
Formosa	15,116	24,000	22,779

*Preliminary †Included in India

World tea exports in 1950 approximated the pre-World War II level, but were 9% below the previous year. Indonesian production progressively recovered and east African production increased.

Telegraphy. The centennial of the Western Union Telegraph company on April 1, 1951, marked 100 years of progress in rapid communications. The crowning achievement of the century of progress was the completion of a network of 15 high-speed message centres which could be compared to a giant spider web spun over the nation and even reaching out to foreign countries. This network doubled the capacity of the nation's telegraph system and vastly increased its efficiency of operation. The cost of the system and other improvements was $100,000,000.

HIGH-SPEED TELEGRAPHIC switching centre for the U.S. air force, installed at the Pentagon, Washington, D.C., in 1951. The new push-button system meant an eventual saving of more than $1,000,000 annually

Each high-speed message centre serves an area covering one or more states. The operator transmitting a message from a telegraph office may type a routing symbol at the beginning of each telegram. That symbol causes an "electrical brain" at the message centre to route and flash the message to its destination. Under this system, a telegram is typed only once, at the point of origin.

With high-speed switching of telegrams, plus the addition of more than 2,000,000 mi. of radio beam and carrier circuits, and improved methods of picking up and delivering telegrams, including the Desk-Fax miniature facsimile machine, telegrams and cablegrams could in 1951 move faster and more efficiently than ever.

Desk-Fax.—The Desk-Fax takes up less than one square foot of space and enables the user to send and receive telegrams and cablegrams automatically and instantly by the push of a button. During 1951 the Western Union company handled more than 3,000,000 telegrams over about 4,000 Desk-Fax machines in the offices of business firms in 25 key cities. Installation of another 5,000 Desk-Fax machines was planned in 1952.

World's Fastest Telegraph.—High-Speed Fax, the world's fastest practical communication method, with a faster-than-speech speed of 3,000 words a minute, was publicly demonstrated in March. Ten times faster than any previous facsimile telegraph, the new high-speed facsimile machine could transmit and receive over any distance with absolute accuracy.

Any written, printed or picture matter to be sent by High-Speed Fax is inserted into a horizontal, transparent cylinder. Closing the end gate of the cylinder automatically starts it revolving before a scanning photoelectric "eye" at 1,800 r.p.m. Instantaneous, automatic reception takes place at the destination city where a receiving machine ejects facsimile reproductions of the sent pages. A 90-page issue of a magazine could be flashed by High-Speed Fax to a distant point in one hour.

U.S. Air Force Network.—The U.S. air force formally inaugurated on April 9, 1951, a nation-wide push-button telegraph network that linked more than 200 of its stations in the United States with high-speed communications. Leased by the telegraph company to the air force, the network included more than 130,000 mi. of telegraph circuits interconnecting the stations and the five push-button switching centres at the Pentagon building at Washington, D.C., Sacramento, Dayton, Montgomery and Ft. Worth. One feature was simultaneous transmission of multiple-address messages by means of "dual control" and "master sending" push-button panels. Approximately 1,500 operators on the network included 350 members of the women's air force.

Also in 1951 the Western Union company added new push-button centres connecting many additional stations to the extensive private wire switching systems leased to the United States Steel corporation and the General Electric company. Networks leased to the Bank Wire, serving many banks, and to many large companies also were expanded.

Rates and Taxes.—More words in telegrams, as well as additional words at reduced rates, were offered under rate revisions introduced in 1951. For the basic charge, under the new rates, the public could send 15 words instead of 10 in telegrams, and 50 words instead of 25 in night letters.

The federal excise tax imposed on senders of telegrams was reduced 40%, effective Nov. 1. It was estimated that the reduction in this tax would save the public more than $14,000,000 annually.

Submarine Cable Amplifier.—At the close of the year the Western Union company was tripling the capacity of its transatlantic cable system by installing submerged amplifiers on the ocean bottom in five cables between the United States, Newfoundland and Ireland. The amplifiers would triple the speed of the cables and provide additional all-weather communication facilities to ensure secret, high-speed handling of military and diplomatic communications in time of emergency, and at the same time to meet the growing peacetime demand for rapid and dependable international service.

FILMS OF 1951.—*Communications and Our Town* (Carl F. Mahnke Productions). (W. P. MA.)

Telephone. The world total of telephones on Jan. 1, 1951, was estimated at 74,800,000, 58% of which were in the United States. The United Kingdom was second with 5,433,614 and Canada was third with 2,911,900 (*see* table on page 670).

The year 1951 marked the 75th anniversary of Alexander Graham Bell's historic invention. U.S. telephone activity during the year was high-lighted by the completion of the first transcontinental microwave radio-relay system and the inauguration on a trial basis of long-distance dialing by customers. At the same time progress continued in the industry's expansion and improvement program to meet growing defense and civilian needs.

Telephones in service in the U.S. increased by 2,450,000 during the year to bring the total to 45,450,000, of which 82% were operated by the Bell system. The rest were served by about 5,500 non-Bell companies.

Of all U.S. telephones, 31,800,000 were residence installations, with 64% of all U.S. households having telephone service. Evanston, Ill., continued to top the list in this respect, with an average of 97 telephones for every 100 households at the beginning of 1951.

The United States also led the world in proportion of instruments to population, with 28.1 telephones per 100 persons at the beginning of the year. Sweden was second with 23.9 and Canada third with 20.8. The world average was 3.1 telephones per 100 persons. New York city continued to lead the world's cities in the number of telephones, with 3,137,405 instruments at the beginning of the year—more than any country in the world except the United Kingdom. Greater London was second with 1,632,900 telephones and Chicago, Ill., third with 1,526,156. Washington, D.C., led the cities in telephones per capita, with 60.6 per 100 persons, while San Francisco, Calif., was second with 55.5 per 100 persons and Stockholm, Swed., third with 47.9.

Acceleration of the U.S. defense program and continued heavy usage by civilians combined to set new records for total telephone conversations during the 75th anniversary year of the telephone. An average of more than 175,000,000 local and long-distance calls per day were completed during 1951, an increase of 5,000,000 per day over 1950. Long-distance calls alone averaged more than 6,000,000 per day.

U.S. Plant and Equipment.—During 1951, $1,100,000,000 was expended by the U.S. telephone industry to expand and improve its facilities, bringing total investment in plant and equipment to about $12,150,000,000. For the Bell system, the total was approximately $11,000,000,000. Since the end of World War II, more than $6,700,000,000 had been spent by the industry to improve and enlarge the U.S. telephone system.

The transcontinental microwave radio-relay system represented one of the most important single plant additions of the year. Consisting of 107 relay stations, the new system utilized directional antennas to beam telephone and television signals from one station to the next. Opened for telephone service on Aug. 17, it added hundreds of toll telephone circuits along its 3,000-mi. route. Other new toll circuits added during the year increased the industry's toll wire network to 28,500,000 mi.

During the year the industry continued its program of conversion of nondial telephones. The total number of automatic Bell telephones in operation increased to nearly 29,000,000, more than 77% of all Bell instruments in service. About 72% of all U.S. telephones were dial-operated at the end of the year.

Shipments by the Western Electric company—manufacturing and supply unit of the Bell system—included 49,000,000,000 conductor feet of exchange cable, 2,500,000 telephone sets and enough local central office switching equipment to serve more than 2,000,000 additional telephone subscribers. Western Electric also devoted a large part of its productive capacity to government orders.

Although Bell Telephone companies alone installed 9,000,000 telephones and achieved a net increase of 2,089,000, the Bell system had a backlog of nearly 800,000 orders for new service at the end of 1951. In addition, the Bell companies had 1,800,000 requests on file for better grades of service.

Television.—The first coast-to-coast U.S. television program was carried over the transcontinental microwave system on Sept. 4, when millions of Americans watched Pres. Harry S. Truman open the Japanese Peace conference at San Francisco. The new microwave system added 12 television stations in three cities to the existing network and, with other stations added during the year, increased the potential audience for network television by 10,000,000 people.

During 1951 approximately 12,000 mi. of radio-relay circuits were installed, while 3,000 mi. of coaxial cable circuits were added. Both were capable of carrying video signals as well as telephone messages. The total television channel mileage at the end of the year was 24,000. (*See* also TELEVISION.)

Long-Distance Dialing.—Dialing of long-distance calls by customers was inaugurated on a trial basis in Englewood, N.J. on Nov. 10, 1951. Individual and two-party line customers in that city could now dial directly to any of 11,000,000 telephones in cities as far away as San Francisco. Other areas within dialing range of Englewood included Boston, Mass., Philadelphia, Pa., Providence, R.I., Pittsburgh, Pa., Cleveland, O., Detroit, Mich., Chicago, Milwaukee, Wisc., Oakland, Calif., Sacramento, *Telephones in Selected Countries of the World, Jan. 1, 1951*

Calif., and New York city and several of its suburban areas. Automatic accounting equipment keeps track of the charges when a customer dials a long-distance call, summarizes the call information and prints it in final form on the customer's monthly bill. Customers using the new system could dial cross-country in a matter of seconds; 30 years before, when the first transcontinental call was made, it took about 14 min. to establish a connection.

The number of cities to which operators can dial long-distance calls directly also continued to increase during 1951. At year's end, approximately 1,250 localities could be dialed by operators, with 38% of all toll calls being handled in this manner.

Overseas Calls.—Bell system radiotelephone stations handled a total of 888,000 messages to foreign countries and ships on the high seas in 1951, representing an increase of 24% over the preceding year. During the year, telephone service was extended to British West Africa, Guam and Cyprus, making it possible for telephone users in the United States to reach approximately 90 foreign countries and territories, or all but about 4% of the total telephones in the world. Service to Korea was interrupted by war in January, but was re-established about one month later.

Mobile Service.—Bell system mobile telephone service was available at year's end in more than 500 communities. The Bell Telephone companies were providing general mobile service to 10,700 vehicles of all types, which were placing about 330,000 calls a month. The companies also furnished 5,500 mobile telephones for the exclusive use of specific customers. (*See* also FEDERAL COMMUNICATION COMMISSION.)

Television.

The freeze on construction of new U.S. television stations imposed by the Federal Communications commission late in 1948 was still in effect throughout 1951. As a result, only one additional station, authorized before the freeze, went on the air in 1951, making a total of 108. Practically all were operating profitably. The hearing which began in Oct. 1950 about reallocation of the 12 VHF channels and of the ultra-high frequency (UHF) television band, was concluded early in 1951. The decision included a revised allocation plan based on testimony received during the hearing. Channels in specific cities representing about 10% of the total assignments were reserved for noncommercial educational television. The petition of the American Telephone and Telegraph company for 30 mc. of the UHF television band for multichannel mobile radio-telephony was denied in favour of television broadcasting. The commission's revised allocation plan was scheduled for hearing in May 1951 but all parties agreed that, because of the complexity of an oral hearing and in the interest of lifting the freeze as quickly as possible, a written proceeding would be acceptable. All parties submitted their direct testimony and engineering data, followed by countercomments, on a prearranged timetable so that the final information was in the hands of the commission on Nov. 26, 1951.

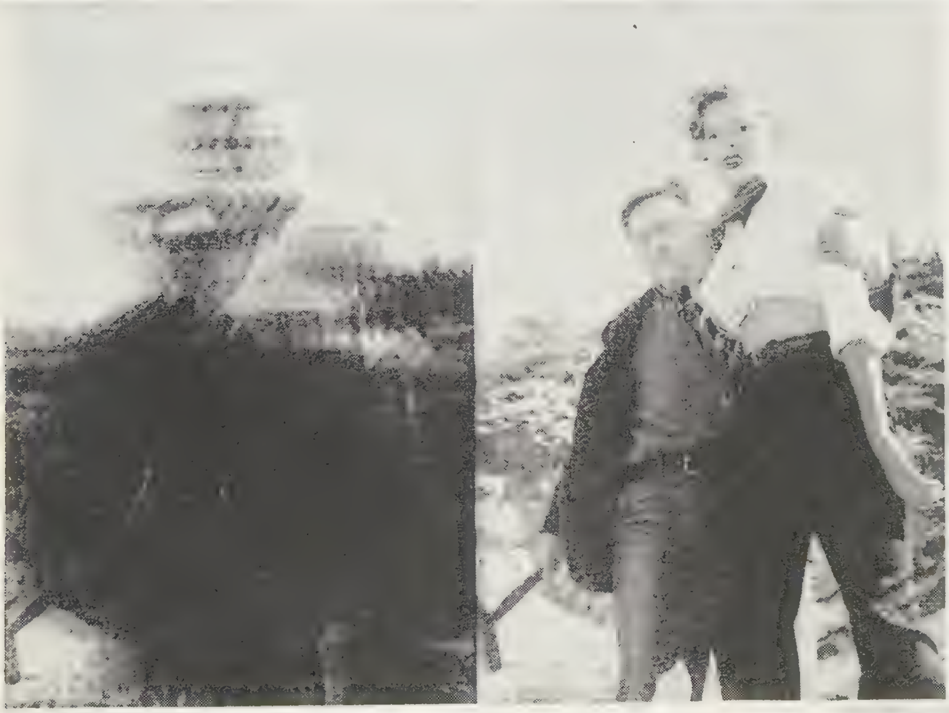
During the year the commission relaxed its freeze order slightly by permitting stations which had been required to operate their transmitters below maximum rating to increase their effective radiated power and utilize full transmitter power. Although the increase was small in most cases, there were a number of instances where a substantial increase in service area was possible. The new standards proposed by the commission would permit maximum effective radiated power of 100 kw. on very-high frequency (VHF) channels 2–6 and 200 kw. on the higher VHF channels and on all UHF channels. The existing ceiling was 50 kw. A number of applications were pending before the commission for increases to the higher value.

Extensive use was made of the RCA-NBC experimental UHF television station KC2XAK at Bridgeport, Conn., which was operated throughout the year on a regular schedule carrying the same programs as the WNBT-VHF transmitter in New York. A large number of television receiver manufacturers used the Bridgeport station as a proving ground to test their UHF receiver designs and to demonstrate the ease of converting VHF receivers to receive signals from UHF stations.

Colour Television.—The decision issued by the commission late in 1950 adopting the CBS colour television system was appealed to a three-judge district court by RCA and several other radio manufacturers. On Dec. 20, 1950, the court, by a 2 to 1 majority, sustained the FCC order. This decision was appealed to the supreme court by RCA and at the end of May 1951

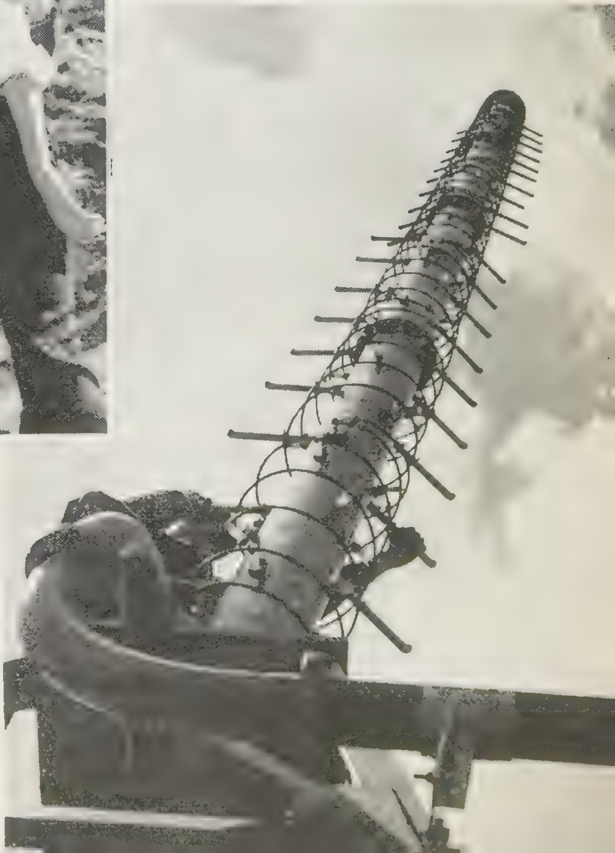
Above: TELEVISION VIEWER installed in a motorcar in 1951 for the convenience of rear-seat passengers. Controls were installed in one armrest and an aerial attached to the trunk

Above: IMOGENE COCA, TV comedienne, using salt to catch a faun in her parody of the ballet *Afternoon of a Faun.* Miss Coca was featured on *Your Show of Shows*, a 1951 program of the National Broadcasting company



Above: PHONEVISION, a 1951 experiment in televised films begun in Chicago, Ill., by the Zenith Radio corporation. Subscribers were billed $1 per showing for receiving the unscrambled picture at right; nonsubscribers received only the scrambled image at left

Below: "HELICAL" ANTENNA for ultrahigh-frequency television transmission, which increased TV transmitting power 20 times. It was developed by engineers of the General Electric company at Syracuse, N.Y., in 1951



the supreme court affirmed the district court's judgment sustaining the order of the commission. The commission revised its rules to include standards for the field sequential (CBS) colour system, and CBS began daily broadcasts of colour a half-hour in the morning and a half-hour in the afternoon. All or part of these broadcasts were carried by stations in New York city, Boston, Mass., Philadelphia, Pa., Baltimore, Md., Washington, D.C., and Chicago, Ill.

The commission's order provided that the door was still open for further hearings on colour systems provided they could meet certain criteria. RCA announced that it would continue development of its all-electronic system. The Radio-Television Manufacturers association also outlined a program for development and field testing of a compatible colour television system according to standards agreed upon by the colour television panel of the R.T.M.A.-sponsored National Television Systems committee. Tests of experimental colour systems over existing commercial television broadcasting stations were limited by the commission to periods outside normal program hours. Under experimental authorization, RCA conducted colour television tests in New York city and Washington, D.C., including remote pickups, microwave relay and coaxial cable transmissions. Tests of the N.T.S.C. compatible colour television standards were conducted during the latter part of the year by RCA, Philco, General Electric, Hazeltine and others.

In June, CBS stockholders approved the purchase of the tube manufacturing facilities of Hytron and its radio receiver subsidiary, Air King. A schedule for the production of colour television receivers was announced and a special request for materials was submitted to NPA. On Oct. 19 Charles E. Wilson, director of defense mobilization, denied the request and banned the production of commercial colour television receivers by the radio industry. CBS immediately announced that it would comply and would also discontinue the broadcasting of colour television programs.

Receivers.—Based on actual production figures for the first ten months, the total 1951 production of television receivers was estimated at 5,200,000—70% of the number produced in 1950. Picture tube production was estimated at 5,900,000 units. The trend toward larger picture tubes which was evident in 1949 and 1950 continued; the majority of receivers produced used 17-in. or larger picture tubes. The reduction in television receiver production in 1951 was attributed more to a lack of demand than a shortage of materials.

Television Broadcasting.—At the end of 1951, 108 stations were operating on a regular schedule in 63 metropolitan areas—an increase of only one station during the year. Fifty-four cities were interconnected by television networks. The most important addition to network facilities in 1951 was the completion by the American Telephone and Telegraph company of the microwave relay chain between Omaha, Neb., and San Francisco, Calif., linking the east and west coasts. This circuit was opened early in September, ahead of schedule, at the request of the department of state to permit the nationwide televising of the signing of the Japanese peace treaty in San Francisco. At the end of September, regular commercial programs were being exchanged between the east and west coasts.

One of the most significant events in television broadcasting during the year occurred during March when the proceedings of the senate crime committee under the chairmanship of Sen. Estes Kefauver were telecast from New York and Washington. For several weeks audience surveys taken during these proceedings indicated a television audience in excess of 18 times the size of the average weekday morning audience, and even higher figures in the afternoon and evening.

In October, the department of justice filed a civil suit in Philadelphia charging the National Football league with entering into an agreement to restrain trade and commerce in the broadcasting and telecasting of professional football games in violation of the Sherman Anti-Trust act.

Sales of Networks Involving Television Stations.—The General Tire and Rubber company purchased from the estate of Thomas S. Lee enterprises for $12,300,000 radio and television properties which included the Don Lee and Yankee regional networks. In addition to a few AM and FM broadcast stations, this property included television stations KHJ-TV in Los Angeles, Calif., and WNAC-TV in Boston, Mass. In October, a plan to merge the General Tire interests with those of the R. H. Macy and Company (General Teleradio, Inc.), owners of WOR-TV in New York, was revealed.

At the end of 1951, an application was pending before the Federal Communications commission for the purchase of the American Broadcasting company network by United Paramount Theaters. It was planned to transfer the control of ABC to United Paramount for $24,000,000 and establish a new company which might function more efficiently in the public interest. This transaction was claimed to be the largest in radio history and included five television, five standard broadcast and four FM stations. The FCC set this proceeding for hearing early in 1952.

Theatre Television.—Interest in theatre television increased substantially, and at the end of 1951 approximately 60 theatres had either installed or were installing projection equipment. Several sporting events of widespread interest were presented in about 13 cities exclusively by theatre television, utilizing the intercity television facilities of the American Telephone and Telegraph company. Competition thus developed between the theatres and television broadcasters for the rights to sporting events of general interest.

The Federal Communications commission announced in April that a hearing to determine whether or not a band of radio frequencies should be allocated to theatre television would be held in September. The commission's preoccupation with television broadcast allocation matters made it necessary to postpone the hearing to November, and again to Feb. 1952.

In Oct. 1951 considerable interest was aroused by a series of theatre television demonstrations in colour given by RCA at the Colonial theatre in New York. The colour system employed in these demonstrations was the all-electronic compatible colour television system which RCA advocated for home television.

Subscription Television.—At the beginning of the year the Zenith Radio corporation, under an experimental authorization from the Federal Communications commission, conducted public tests of its system of subscription television in the Chicago area. The system, known as "Phonevision," involved the transmission of a program over a regular television broadcast station which is "scrambled" in such a way that it cannot be received satisfactorily in the normal manner. A coded signal is transmitted via telephone lines to the homes of persons desiring to subscribe to the Phonevision service which is applied to the receiver to unscramble the program. A nominal fee is charged for each program received in this manner.

The Zenith tests lasted for three months and were received in about 300 homes. The programs consisted of grade A motion picture films not previously shown on television; a fee of $1 per film was charged (during these tests all fees collected were donated to charity). The results of these tests were to be submitted to the Federal Communications commission and it was expected that Zenith would file a petition for rulemaking proceedings to establish this service on a regular basis.

Meanwhile, other subscription television systems were proposed. Skiatron corporation of New York tested its system over WOR-TV, New York, during the year. The Skiatron system, known as "Subscriber-Vision," differed from Phonevision in that telephone line connections were not required. The Skiatron system employed a coded card inserted in a receiver equipped with the necessary decoding device.

Wired Television.—Interest increased in systems designed to bring television to areas outside the normal service range of existing stations. The basic arrangement of these systems includes a community antenna at the best possible location near the area to be served and a cable system from the antenna to the various receivers in the area. A number of manufacturers who had made antenna and distribution systems for receivers in hotels and apartment houses found this type of antenna system ideally suited for serving small communities. (*See* also ADVERTISING; EDUCATION; HUMOUR OF 1951; LAW; MOTION PICTURES; MUNITIONS OF WAR; RADIO.) (G. L. Bs.)

Europe.—In spite of the claims of rearmament on factories producing television equipment, television made progress throughout western Europe in 1951. Public services continued in France on 441 and 819 lines from transmitters in Paris and Lille. In England a third transmitter, at Holme Moss, Yorkshire, was added in October to the two already in service (Alexandra Palace, London, and Sutton Coldfield, near Birmingham) on 405 lines. Limited public services on 625 lines were established in western Germany in the summer and in Denmark and the Netherlands in October. Considerable preparatory work, including experimental transmissions for the establishment of services, was carried out in Belgium, Sweden, Switzerland and Spain. It was announced that a public service would begin in Madrid and Barcelona during the first half of 1952. In Norway a government television committee was appointed in April to advise on the establishment of a service in the Oslo area. Radio Italiana studied the question of television for northern Italy and Rome but announced no specific plans for a public service. Arrangements were made in November to establish a television-radio link between Paris and London via Lille, Calais and Dover, converting from 819 to 405 lines between Calais and Dover, to be in operation by July 1952; this would enable programs broadcast from Paris to be seen in London, and vice versa.

In Great Britain the outstanding achievement was the opening of the north of England transmitting station at Holme Moss, which brought television within the reach of about 11,000,000 new viewers and increased the coverage to nearly 60% of the population. The new station, similar in design to that at Sutton Coldfield, was situated about 1,700 ft. above sea level in the Pennines near Huddersfield. The vision transmitter had an output power of approximately 45 kw. on a frequency of 51.75 mc./sec. (5.8 m.). The sound transmitter had an output power of 12 kw. and was identical with that at Sutton Coldfield except that its frequency was 48.25 mc./sec. (6.22 m.). The extension of the service necessitated the extension of the network operated by the general post office over which the programs were passed from the studios in London to the transmitting stations. The G.P.O. network would eventually be extended by radio link to Kirk o'Shotts (between Glasgow and Edinburgh), the site of the Scottish television station under construction.

A separate coaxial cable link would be provided from London to Bristol and Cardiff to feed the station being built at Wenvoe, Glamorganshire.

Problems of television in schools were examined in July by the B.B.C. and a committee of the Schools Broadcasting council of the United Kingdom. It was decided that though television would be of great value as an aid to teaching, a pilot scheme should first be operated on a closed circuit among a few schools in London before any general plans could be drawn up.

Tellurium: *see* MINERAL AND METAL PRODUCTION AND PRICES.

Tennessee. A south central state, 16th to enter the union. Tennessee is called the "Volunteer state." Land area 41,797 sq.mi., water area about 447 sq.mi. Population (1950): 3,291,718; rural 1,839,116, urban 1,452,602, rural farm 1,016,204; white 2,760,250, nonwhite 531,468.

The population of principal cities in 1950: Nashville (capital) 174,307; Memphis 396,000; Chattanooga 131,041; and Knoxville 124,769.

History.—The state commissioners, appointed by Gov. Gordon Browning, were in 1951: agriculture, Edward Jones; conservation, C. P. Swan; education, James A. Barksdale; finance and taxation, Clarence Evans; highways and public works, C. W. Bond; institutions, Houston Brown; public welfare, J. O. McMahan; insurance and banking, M. O. Allen; labour, J. L. Case; public health, R. H. Hutcheson; safety, Sam K. Neal; employment security, E. K. Wiley. Railroad and public utility commissioners elected by the people were: Hammond Fowler, John Hammer and J. B. Avery.

The constitutional officers were: James H. Cummings, secretary of state; W. N. Estes, state treasurer; Cedric Hunt, state comptroller.

In 1951 a proposal was made to elevate Memphis State college to university rank affiliated with the University of Tennessee, but this failed of passage. However, the University of Tennessee Junior college at Martin was made a four-year affiliate of the university.

A proposed constitutional amendment to prevent diversion of the gasoline tax failed of passage.

The Tennessee Valley authority was constructing a large steam plant to generate electricity in the Swan Pond area of Roane county.

Education—Enrolment in elementary schools in 1950 was 539,445, an increase of 2.6% over 1949. High school enrolment was 120,340, an increase of 6.2%. Total net enrolment in 4,632 schools was 659,785. There were 4,284 county and 348 city schools, 3,686 white and 946 Negro. The total number of teachers was 23,067.

Social Insurance and Assistance, Public Welfare and Related Programs.—In Sept. 1951 the total amount of assistance was $2,955,080 to 123,798 cases; 62,429 old-age recipients received $1,814,385; 58,623 dependent children $1,038,047; and 2,746 blind received $102,649. The decrease in payments compared with Oct. 1950 was 13.7%.

There were in 1950–51 seven correctional institutions in the state with expenditures of $6,134,432. A school was maintained for the blind and deaf, three state hospitals for the insane, a home for the feeble-minded and an industrial school.

Communications.—Of the 65,351 mi. of public road in 1950, 7,862 mi. were state highways; expenditure for construction of highways was $49,513,652. There were 3,491 mi. of railroad. As of June 1951 there were 74 civilian airports, of which 23 were commercial, 25 municipal, 1 CAA intermediate and 16 private. There were 672,168 class A and B telephones in Tennessee, 185,075 business and 487,093 residential. Water-borne commerce on the Tennessee river in 1950 amounted to 3,051,162 short tons: Cumberland river 1,478,543 (1949); Mississippi river 18,709,423 (1949); and 2,480,413 (1949) at the port of Memphis.

Banking and Finance.—In June 1951 there were 74 national banks and 221 state banks; assets $1,527,380,000 for national and $595,763,573 for state banks; deposits $1,422,890,000 for national banks and $544,070,080 for state banks. Savings and loan associations numbered 40 with assets of $72,077,935. Federal associations constituted 36 of these with assets of $71,717,960.

State revenue collected for the fiscal year 1950–51 was $166,164,844. Federal aid amounted to $49,500,000; proceeds from bonds sold, $12,400,000. Debt outstanding was $100,197,500, an increase of $3,507,500 during the year. Receipts increased by $19,511,029 over 1950, expenditures by $12,530,439. Of total expenditures of $245,300,000, $69,076,717 was for education, highways $47,338,089, welfare $42,672,410 and distribution to cities and local governments $22,446,324.

Agriculture.—The gross value of agricultural production in 1950 was

Table I.—*Principal Crops of Tennessee*

Crop	1951	1950	Average 1940–49
Corn, bu.	60,360,000	69,582,000	65,294,000
All hay, tons	1,685,000	1,963,000	2,211,000

Zinc	35,326	10,032,584	29,788	7,387,424
Other minerals		?		5,417,063
Total		?		$81,272,550

*Values for processed materials are not included in the totals.

$539,797,000; cash farm income $437,079,000. Cash income from crops was $216,811,000, from livestock $213,533,000 and from government payments $6,735,000. The value of home consumption was $102,718,000. The forest area was 12,641,000 ac.

Manufacturing.—According to the 1947 census of manufacturing, 3,346 manufacturing plants employed 221,454 persons, wages and salaries being $473,211,000. Value added by manufacture was $957,539,000, led by chemical industries $162,578,000, food $132,489,000 and textiles $121,294,000. (C. E. A.)

Mineral Production.—Table II shows the tonnage and value of mineral production in the state in 1949 for commodities having values in excess of $100,000, and corresponding data for 1950, so far as they were available at the close of 1951. Tennessee ranks second among the states as a producer of phosphate rock.

Tennessee Valley Authority.

The installed capacity of the TVA integrated power system was increased by 475,000 kw. during 1951, bringing the total to 3,520,000 kw. Construction was under way or planned to nearly double the capacity by 1954. The increase in capacity was dictated by increasing demands for power for national defense, particularly for atomic energy plants, superimposed upon rapidly growing conventional demands for electricity in the region.

About half the new capacity added during the year was in the first two of six 112,500-kw. generating units at Johnsonville steam plant, on the east bank of Kentucky reservoir. Among other installations during the year were 180,000 kw. at the Center Hill and Wolf Creek dams of the U.S. army engineers on the Cumberland river, from which TVA purchases the output, and 35,000 kw. at TVA's new South Holston dam in upper east Tennessee.

TVA started construction of three new steam plants: Shawnee near Paducah, Ky., 540,000 kw., to provide power for a new atomic energy plant under construction in west Kentucky; Kingston, near Kingston, Tenn., 540,000 kw.; and Colbert, seven miles below Wilson dam, Ala., 360,000 kw. Two dams, Boone and Fort Patrick Henry, were under construction in east Tennessee.

Power generation for the fiscal year ended June 30, 1951, was 18,000,000,000 kw.hr. Total operating revenues were $70,000,000. Net operating revenues of $26,717,000 represented a return of 5.4% on the average net power investment. Operating revenues of the 145 municipal and co-operative systems, which sold in excess of 8,000,000,000 kw.hr. to more than 1,170,000 consumers in the fiscal year, were $94,300,000. Net operating revenues were $20,300,000, representing a return of 8%. Average residential use was 3,609 kw.hr. per customer and average cost was 1.38 cents per kilowatt hour compared with national averages of 1,975 kw.hr. and 2.84 cents per kilowatt hour.

Freight traffic continued to rise on the 630-mi. navigation channel provided by TVA's multipurpose system of dams. With sharp increases in petroleum products, grain, iron and steel products and chemicals, traffic amounted to 589,000,000 ton-miles in 1950, up 16% from the year before. Savings to shippers were estimated at more than $7,000,000.

The TVA reservoirs reduced a moderate flood by ten feet at Chattanooga, Tenn., thereby averting an estimated $350,000 in flood damages and bringing the total damages averted at that industrial city to more than $45,000,000.

The world-wide sulphur shortage focused attention of fertilizer manufacturers and agriculturalists more sharply on TVA's phosphate fertilizer processes which, contrary to ordinary commercial processes, require no sulphur or sulphuric acid. In view of the sulphur shortage and the continuing high demand for fertilizers, TVA reversed a decision it had made to discontinue production of concentrated superphosphate June 30, 1951, in line with its policy of leaving the field to private industry once processes have been fully developed and the product established in farm use. During the fiscal year TVA produced 143,000 tons of concentrated superphosphate, 31,300 tons of calcium metaphosphate, 17,500 tons of fused tricalcium phosphate and 136,000 tons of ammonium nitrate. Considerable amounts were used in farm test demonstrations, but most was sold through co-operatives and a few private companies advocating use of the materials in soil- and water-conserving types of agriculture.

At the end of 1950, a survey showed about $28,000,000 had been expended for recreational facilities on TVA lakes and shores by states, local agencies and private interests and individuals. Examination of more than 6,000 blood films revealed no evidence of malaria along the lakes in 1950.

The board of directors consisted of Gordon R. Clapp, chairman, and H. A. Curtis. There was one vacancy caused by the retirement of James P. Pope at the end of his nine-year term. He had served since Jan. 5, 1939. (*See* also DAMS; ELECTRICAL INDUSTRIES; PUBLIC UTILITIES.) (K. R. K.)

Tennis.

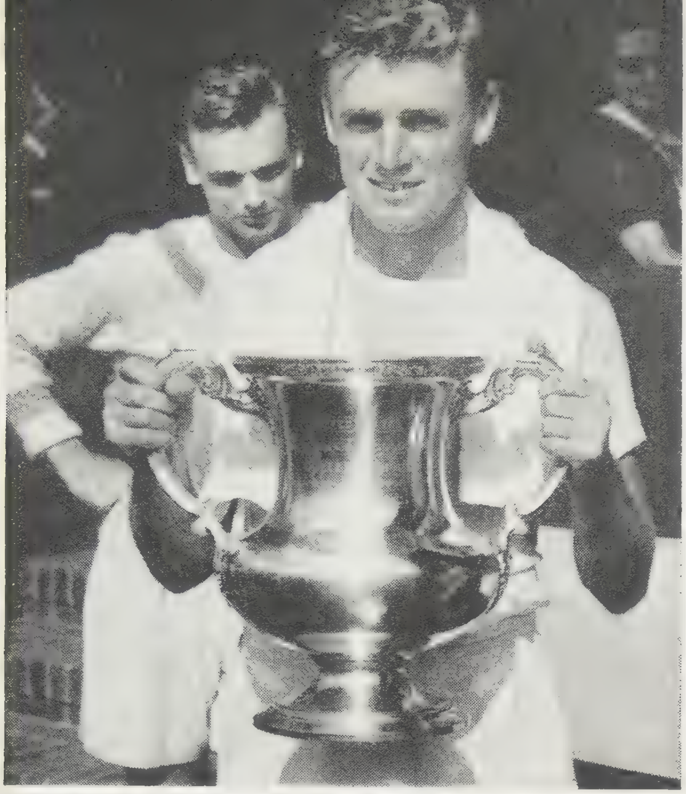
International tennis events at Paris, Fr., Wimbledon, Eng., Forest Hills, N.Y., and in Australia attracted capacity crowds as young players came to the fore and new champions were crowned.

Outstanding were the surprising rise of Richard Savitt of the United States, who won the Australian and English championships; the achievement of the 16-year-old California girl, Maureen Connolly, in winning the U.S. women's singles championship; the overthrow of the Mrs. Margaret Osborne du Pont-Louise Brough dynasty by Doris Hart and Shirley Fry which occurred at Wimbledon; and the establishment of Australia's Frank A. Sedgman as the leading amateur of the world as a result of his easy win of the U.S. championship and his decisive victories in the Challenge Round which enabled Australia to retain the Davis cup by defeating the U.S., 3–2.

Savitt singlehandedly defeated Australia's 1950 victorious Davis cup team—Sedgman, John Bromwich and Kenneth McGregor—to capture his first important international title in Australia in January. Jaroslav Drobny, the former Czech, was outstanding during the early season in Europe and climaxed his successes by winning the French championships in which most of the world's leading players competed. At Wimbledon, Savitt defeated Arthur Larsen and Herbert Flam of the U.S., winner and runner-up respectively in the 1950 U.S. championship, and repeated his Australian victory over McGregor in the final.

In the U.S. Vic Seixas and Tony Trabert, who did not play abroad, set the pace. Trabert won the U.S. Intercollegiate and USLTA Clay Court events and the Southampton Invitation while Seixas won the Bermuda, Spring Lake and Pennsylvania titles. Seixas reached the final of the U.S. championship played at the West Side Tennis club, Forest Hills, N.Y. He eliminated Flam and Savitt, who was handicapped by a leg infection, but bowed to Sedgman 6–4, 6–1, 6–1 in the final. By capturing the U.S. doubles championship Sedgman and McGregor set a record by winning in one year the four major doubles championships of the world, the others being those of Australia, France and England.

Of the 26 nations which challenged Australia for the Davis



FRANK SEDGMAN, first Australian to win the U.S. amateur lawn tennis singles trophy, shown after the match at Forest Hills, N.Y., on Sept. 4, 1951. He defeated Victor Seixas (left), 6–4, 6–1, 6–1

cup, Sweden in the European zone and the United States in the American zone made clean sweeps to gain the interzone final which was played in Melbourne, Austr., in Dec. The U.S. won when Trabert and Frederick R. Schroeder, Jr., defeated Lennart Bergelin and Sven Davidsson, 5–0. The Challenge Round was played in Sydney, Austr., late in December in White City stadium. Sedgman downed Schroeder in four sets and then after winning the doubles with McGregor over Schroeder and Trabert, captured the deciding point for Australia by defeating Seixas 6–4, 6–2, 6–2. The U.S. scored its two points when first Seixas and then Schroeder defeated Mervyn Rose in the other two singles matches.

The accomplishment of Miss Connolly, second youngest player to win the U.S. women's championship, overshadowed performances by Miss Hart and Miss Fry, whom Miss Connolly defeated in the semifinal and final respectively at Forest Hills. Miss Fry defeated Miss Hart, the defending champion, for the French title and together the two Americans retained their French doubles championship. Miss Hart beat Miss Fry for the English championship at Wimbledon after Miss Fry had eliminated Miss Brough, champion for the previous three years.

Miss Hart and Miss Fry also captured the Wimbledon doubles title from the four-time winners, Mrs. Du Pont and Miss Brough. Having suffered a sore arm, Miss Brough withdrew from tournament play after Wimbledon and so did Mrs. Du Pont, thus terminating their nine-year reign as U.S. doubles champions as Miss Hart and Miss Fry also annexed that title for their third major doubles championship. Miss Hart and Sedgman likewise won the mixed doubles championships of France, England and the U.S.

The U.S. again was successful in its defense of the Wightman cup against England. The matches, played at Chestnut Hill, Mass., were more closely contested than the 6–1 score might indicate. The English girls showed marked improvement, and Jean Quertier scored a notable win over Miss Fry. (E. S. Br.)

Terramycin: *see* CHEMOTHERAPY.

Texas.

A west south central state of the United States, Texas is known as the "Lone Star State" from the single star in the flag of the Texas republic, 1836–1845. Land area, 263,513 sq.mi.; inland water, 3,826 sq.mi.; total 267,339 sq.mi. Population (1950 census) 7,711,194, 20.2% over 6,414,824 in 1940. Urban population, 4,838,060 or 62.7%; rural 2,873,134 or 37.3%. Total white population (preliminary), 6,825,000 or 88.5%; nonwhite, 886,000 or 11.5%. Capital: Austin, with 132,459 population in 1950. Other cities ranked by population in 1950: Houston 596,163; Dallas 434,462; San Antonio 408,442; Fort Worth 278,778; El Paso 130,485; Corpus Christi 108,287; Beaumont 94,014; Waco 84,706; Amarillo 74,246; Lubbock 71,747; Wichita Falls 68,042.

History.—The 52nd legislature, January 9–June 8, 1951, enacted approximately 500 general statutes, the more notable of which were greater restrictions on gambling, election code revision, redistricting of legislative districts, driver responsibility (insurance) and auto inspection, restrictive labour legislation and new tax levies. Five constitutional amendments were submitted for Nov. 13, 1951, and two for Nov. 4, 1952. Of the five submitted in 1951, only one carried, providing for issuance of $75,000,000 of state bonds to provide loans to World War II veterans for farm and ranch purchases. The principal state officials for the biennium beginning Jan. 1, 1951, and ending Dec. 31, 1952, were: governor, Allan Shivers; lieutenant governor, Ben Ramsey; attorney general, Price Daniel; comptroller of public accounts, Robert S. Calvert; treasurer, Jesse James; state commissioner of education, J. W. Edgar; commissioner of agriculture, John C. White; commissioner of general land office, Bascom Giles.

Education.—The public school system during 1951–52 consisted of 947 independent and 1,317 common school districts; total 2,264, according to the state department of education. Scholastic census, 1,603,010; average daily attendance (1950–51) 1,218,288; total apportionment from

CIRCULAR PLAYHOUSE opened in Houston, Tex., in Feb. 1951, for the year-round presentation of "Broadway hits, the classics and original plays." Shown here are players in Sean O'Casey's *Red Roses for Me* state (1951–52) $99,386,620; per scholastic $62. In addition to this apportionment, there was state equalization and local district aid amounting to approximately $175,000,000. The permanent public school fund was valued at $182,418,278.67; the number of classroom teachers (estimated) was 46,640; total state expenditure for education during the fiscal year ended Aug. 31, 1951, was $215,607,939.47.

Social Insurance and Assistance, Public Welfare and Related Programs.—The average number on old-age assistance rolls during the fiscal year ended Aug. 31, 1951, was 224,487. The average monthly payment per recipient was $32.82. The number of dependent children was 55,387, representing 19,506 families; average monthly payment per child was $15.54 or $44.11 per family. The number of needy blind was 6,060; average monthly payment was $37.21. Total expenditures for public welfare for the fiscal year ended Aug. 31, 1951, was $120,445,328.86.

Transportation and Communication.—Texas public road mileage Aug. 31, 1950, was 34,929.39 mi. state maintained and 164,707.85 mi. county maintained; total 199,637.24 mi. All but 511.98 mi. in the state system were hard surfaced. County road mileage included 8,032 mi. paved, 36,818 mi. gravel surface, and 119,857 mi. graded dirt or unimproved. State-federal highway expenditures for the fiscal year ended Aug. 31, 1951, were $136,823,782.46. Motor vehicle registration, 1951 (prelim.) was 3,183,500, of which 2,360,000 were private passenger cars. There were 15.559.27 mi. of first main line railroad track and 6,044.81 mi. of auxiliary track in Texas, Jan. 1, 1950, according to the state railroad commission. Tonnage through Texas ports, 1949, according to U.S. corps of army engineers, was 122,630,943, of which 17,874,674 was foreign and the remainder coastwise, internal (canal) and intraport. There were 638 airports, March 27, 1951, according to the U.S. Civil Aeronautics administration. Eleven airlines served the state. There were 1,814,852 telephones in operation Jan. 1, 1951. There were 212 radio stations Aug. 1, 1951, including 176 AM, 30 FM and 6 TV.

Banking and Finance.—State government receipts for the year ended Aug. 31, 1951, were $622,080,973.69; expenditures, $569.500,332.15. Principal receipts were from gross receipts and production (largely petroleum) taxes, $143,722,663.48; highway motor fuel tax, $114.872,323.28; ad valorem tax, $33,843,359.47; cigarette tax, $33,292,320.87; automobile licences, $32,576,399.32. Principal expenditures were for public schools, $183,049,609.97; highways, $136,823,782.46; public welfare (pensions) $120,445,328.86; higher education, $32,558,329.50; eleemosynary and correctional, $30,113,674.95. The state's bonded debt was $4,100,000 of old bonds against the credit of the state, and $100,000,000 of veterans' land purchase loan bonds backed by mortgages and the credit of the state. Total debt of all civil subdivisions, 1949, was $948,862,623.54. On Jan. 1, 1951, there were 442 national and 449 state banks; total 891. National bank deposits were $6,076,006,000 and resources $6,467,275,000. State bank deposits were $1,338,539,519 and resources $1,427,679,687. Total bank deposits $7,414,545,519; total resources $7,894,954,687.

Agriculture.—Harvested acreage, 1951, was 24,695,000 ac. (U.S. department of agriculture), 2% above the 1950 acreage. Total crop was valued at $1,313,683,000 compared with $1,226,198,000 in 1950. Drought caused most 1951 crops to fall below 1950, but higher market values more than compensated for lower production.

The number and value of livestock on farms, Jan. 1, 1951, were as follows: all cattle, 9,260,000, valued at $1,314,920,000; milk cows only, 1,309,000 valued at $236,929,000; hogs, 1,786,000 valued at $43,578,000; sheep, 7,119,000 valued at $154,962,000; goats, 2,433,000 valued at $23,114,000; horses, 324,000 valued at $9,072,000; mules, 120,000 valued at $4,920,000; chickens, 25,884,000 valued at $29,767,000; turkeys, 755,000 valued at $3,775,000.

Manufacturing.—Total employment in manufacturing industries in Texas, Oct. 1, 1951, was 409,900, according to the Texas employment commission, of which 195,700 was in durable goods industries and 214,200 in nondurable goods. Principal employment in durable goods industries was as follows: transportation equipment, 57,200; lumber and wood products, 32,500; machinery, except electric, 31,000. In nondurable goods: food, 61,400; petroleum products, 45,900; chemicals, 37,000. Increase in industrial employment from 297,053 in 1947 (last census) to 409,900 in 1951, indicated an increase from $1,727,464,000 value added by manufacture in 1947 to $2,380,000,000 in 1951. (S. McG.)

Mineral Production.—Table II shows the tonnage and value of mineral production in the state in 1949 for commodities having values in excess of $100,000 and corresponding data for 1950, so far as they were available at the close of 1951. With only a small output of metallics and a moderate output of nonmetallics, Texas holds first place in the value of mineral production by virtue of an output of petroleum and natural gas that alone is more than double the value of the total mineral output of the next largest producing state. Texas is also outstanding as the only producer of helium.

Table I.—*Leading Agricultural Products of Texas*

Crop	1951	1950	Average 1940–49
Cotton lint, bales	4,100,000	2,946,000	3,049,000
Cottonseed, tons	1,691,000	1,232,000	1,249,000
Wheat, bu.	17,307,000	18,992,000	63,486,000
Sorghum for grain, bu.	71,085,000	144,566,000	69,694,000
Corn, bu.	42,143,000	58,420,000	62,517,000
Rice, 100-lb. bags	12,408,000	11,568,000	8,264,000
Sorghum for forage, tons	2,078,000	2,220,000	3,620,000
Peanuts, lb.	109,890,000	330,750,000	303,934,000
Hay, tons	1,346,000	1,418,000	1,437,000
Flaxseed, bu.	75,000	1,268,000	625,000
Oats, bu.	8,145,000	25,818,000	30,912,000

*Values for processed materials are not included in the totals.

Textile Industry.

Activity of the U.S. textile industry in 1951 was limited not by demand, but by supply. Spending capacity was at a high level, and would have continued upward if raw material had been available. Such increase as developed in specific sections of the industry resulted from military demand; the drain on textile materials for civilian purposes was unusually high and at a record price.

Total consumption of cotton in 1951 was approximately 4% lower than in the latter part of 1950, whereas total wool consumption was approximately 8% lower.

Government orders of woollen and worsted woven goods increased from approximately 4,400,000 yd. in the last quarter of 1950 to 32,000,000 yd. in the third quarter of 1951. Conversely, other orders for wool goods decreased from nearly 90,000,000 yd. to approximately 36,800,000 yd. during the same period.

The effect of the international situation was shown sharply in the imports of silk into the United States; they decreased from an average of about 1,170,000 lb. a month in the latter part of 1950 to about 500,000 lb. monthly in 1951.

Major attention in the textile industry continued to be centred on progress in the development of synthetic fibres, both in quantity and in new types. It was increasingly apparent that more and more of the balance of power in the textile industry was coming to rest in the synthetic branch.

(D. G. Wo.)

Great Britain.—Political and economic uncertainty, raw material supplies and prices, labour and power difficulties were the main problems contributing to a disappointing year in the textile industry in the United Kingdom. Despite these adverse factors, however, production of yarn and cloth was well maintained and steadily increased in several instances. The cotton industry suffered from the effects of inadequate supplies of raw cotton—chiefly from the United States—but at the close of 1951 estimates of U.S. (15,000,000 bales of 500 lb. weight), British empire (1,000,000 bales) and Indian growths revealed substantially increased acreages and production. The total Egyptian crop in 1950 was 8,302,906 cantars (cantar=99.05 lb.), the smallest since 1947.

The total weekly average yarn production in the cotton industry in the second period of 1951 was 16,950,000 lb. as compared with 16,080,000 lb. in the corresponding period in 1950. In the same periods the weekly averages for spun rayon were 1,610,000 lb. (1,380,000, 1950); similarly cotton and wool yarns were 70,000 lb. (60,000), and cotton and rayon 330,000 lb. (190,000). Employment in the spinning section was higher at 111,160 (107,510). Weekly averages in weaving in the second period of 1951 revealed that production of gray and coloured woven cotton fabrics totalled 44,480,000 linear yards, as compared with 41,020,000 linear yards in the same period of 1950. Total rayon and mixture fabrics for the same periods were 15,190,000 yd. (13,570,000), and the numbers employed totalled

145,450 (139,270). On the same basis, U.K. exports of cotton yarns were 18,100,000 lb., as compared with 16,900,000 lb. in 1950, and exports of cotton piece goods 247,000,000 sq.yd. as against 183,000,000 sq.yd.; exports of wholly rayon fabrics in the same periods were 28,300,000 sq.yd. (24,300,000). A total of 430,000,000 lb. of raw wool was imported by the U.K. wool industry in the first ten months of 1951, as compared with 595,000,000 lb. in the same period in 1950.

Approximately 42,100,000 lb. of wool tops were exported in the first ten months of the year as against 62,000,000 lb. in 1950. Exports of woollen and worsted yarns in the same periods were respectively 4,400,000 lb. (4,800,000) and 14,400,000 lb. (20,000,000). Similarly, exports of worsted cloth reached 34,200,000 sq.yd. (32,700,000), and exports of woollen cloth 62,800,000 sq.yd. (62,500,000). In September, the number of operatives engaged was 204,000 (209,000 in 1950).

In the cotton industry more progress was made in renewing machinery and equipment than in any year since World War II. The installation of modern opening, carding, drawing and ring spinning machinery proceeded satisfactorily, also the conversion to shortened systems of processing and greater use of high-drafting equipment on speed frames, rings and mules. Although the majority of looms were still nonautomatic, it was encouraging to observe that automatic looms in place totalled about 40,000 as compared with the 17,500 at the end of World War II.

Europe.—The output of the French textile industry from June 1951 to the end of the year declined steadily, particularly in cotton, woollen and rayon yarns and piece goods. Several machinery developments were noticed, however, including a new high draft cotton ring frame incorporating a double-apron two-zone system claiming excellent draft control. Swiss machinery progress centred around highly efficient precision sizing machines, with automatic tension control in the drying chamber and 2 x 1 box silk, and multishuttle, shuttle changing looms. In Germany a new ring frame featured a novel high draft system, a stationary ring rail and positively gear-driven spindles, with centralized lubrication. In Belgium, improved methods for decorticating and retting flax were announced. All European countries were handicapped by restricted supplies of raw materials, *e.g.* fibres and chemicals and metals.

Commonwealth.—In Australia, the cotton spinning and weaving industry had more than 90 mills in operation, producing an extensive range of goods. The 170 woollen mills, employing 25,000 people, produced more than 12,000,000 sq.yd. of worsted cloth and more than 4,000,000 sq.yd. of flannel.

The second largest employing industry in India was the hand loom industry employing 1,434,000 full-time, 750,000 part-time workers producing 1,842,000,000 yd. of cloth on 2,325,000 hand looms, 72% being engaged on cotton. Canadian cotton mill operations slackened appreciably toward the close of 1951. Defense orders accounted for a substantial proportion of business and had a stabilizing effect on the falling off in demand for domestic purposes. Canada remained one of the best markets for U.K. textile specialties. (*See* also COTTON; LINEN AND FLAX; RAYON AND OTHER SYNTHETIC FIBRES; PLASTICS INDUSTRY; WOOL.) (A. DR.)

Thailand

(SIAM). A kingdom of southeastern Asia, Thailand is bounded west and northwest by Burma, northeast and east by French Indochina and south by Malaya. Area: 198,272 sq.mi. Pop.: (1937 census) 14,464,105; (1947 census) 17,317,742; (1950 est.) 18,480,000. The 1937 census revealed only 524,062 Chinese (3.6%), but it included as Siamese the Chinese born in Thailand, whose number already in 1929 was 113,050. Chief towns (1947 census): Bangkok (cap., 884,197); Khon Kaen (590,664); Chiengmai (534,628); Chiengrai (481,621). Language: Thai (Siamese) 75%; Chinese 20%; Indian and Malayan 5%. Religion (1947 est.): Buddhist 95%, Moslem 4%. Ruler: King Phumiphon Adundet; prime minister: Marshal Luang Pibul Songgram.

History.—Thailand suffered two political crises during 1951. On June 29 the prime minister, while attending a ceremony at the Bangkok docks when a dredger presented by the United States was being formally handed over, was kidnapped by a party of marines and removed to the warship "Sri Ayudhya" which lay near by. The naval signals station then issued a radio statement that a new cabinet had been formed, including a number of moderately liberal politicians, though it later appeared that the affair was organized entirely by naval officers and that the politicians were not implicated. The premier's supporters in the army, air force and police acted promptly and fighting went on for two days in Bangkok until the "Sri Ayudhya" was sunk by bombing. The prime minister then managed to swim ashore and rejoin his friends. This ended the disturbances and the army later occupied the naval base at Sattahib without resistance. About 700 naval personnel were arrested, including the commander in chief, Admiral Sindhu, and 73 of these were detained for trial on a charge of treason; but most of the ringleaders, who were junior officers, escaped abroad.

The next disturbances took a different form. On Nov. 28 a group of officers, led by General Phin, the commander in chief of the army, effected a coup d'état: they declared that the existing government was no longer in power and that the parliament had ceased to function. A committee of ten officers assumed authority. The grounds given were that the former government had failed to eradicate corruption, keep down the cost of living or resist communism. The coup was effected without any resistance. A new cabinet was formed, but it still included Marshal Pibul as prime minister, and the deputy premier, the defense, finance, foreign, justice, health and industry ministers of the evicted cabinet also returned to office. The only important change was the removal of the minister of education, Nai Luang Chayakarn. Besides these not very radical changes in the ministry, however, it was announced that the constitution established in 1949 was abrogated and that the less liberal constitution of 1932 would be reintroduced. In pursuance of this, it was announced that instead of a senate and a house of representatives, parliament would consist of a single chamber, half of whose members would be elected and half nominated by the crown; and that pending elections the chamber would consist entirely of nominated members; 123 members were then named, including all the coup leaders and consisting entirely of those favourable to their action. These events occurred immediately before the return to Thailand of King Phumiphon, who arrived from Switzerland on Dec. 2.

In September judgment was pronounced in the trial of those accused of assassinating King Ananda in 1946. A royal page was sentenced to death, but two other accused were discharged for lack of evidence; and the court refused to pass judgment on the exiled statesman Nai Pridi, who had also been named in connection with the charge, since he could not be tried *in absentia*.

The government continued throughout the year its policy of supporting the United Nations action in Korea, where a force of Thai troops participated in the war; and it also maintained its friendly co-operation with the Malayan authorities on the southern frontier. (B. R. P.)

Education.—Schools (1948): government 440, pupils 63,581; local public and municipal 18,670, pupils 2,081,414, teachers 62,028; private 1,501, pupils 167,629; universities 5, students 10,494.

Finance and Banking.—Budget: (1950–51 est.) revenue 1,596,700,000 baht, expenditure 2,052,100,000 baht; (1951–52 est.) revenue 2,200,000,000 baht, expenditure 2,500,000,000 baht. Currency circulation (Dec. 1950): 3,043,000,000 baht. Bank deposits (Dec. 1950): 1,234,000,000 baht. Monetary unit: baht or tical with an official exchange rate of 35 baht to the pound and 12.50 baht to the U.S. dollar.

Foreign Trade.—(1950): imports 2,880,000,000 baht; exports 3,624,000,000 baht. Main sources of imports (1949): Hong Kong 17.3%; U.S. 15.7%; Singapore 13.4%; U.K. 8.7%. Main destinations of exports: Singapore 19.5%; U.S. 15.3%; India 13.4%; Penang 9.1%. Main imports: textiles 19.4%; foodstuffs 11.7%; metal manufactures 8.3%; yarns 6.8%. Main exports: rice 50.7%; rubber 15.7%; tin and tin ore 9.7%; teak 4.1%.

Transport and Communications.—Roads (1949): 3,536 mi. Licensed motor vehicles (Dec. 1950): cars 8,500, commercial 6,570. Railways (1949): 2,033 mi.; passenger-miles (1950) 892,000,000; freight net ton-miles 298,000,000. Merchant shipping (1949): vessels of 200 tons and over 13; total tonnage 4,709. Air transport (1950): miles flown 1,265,000; passenger-miles 11,500,000; cargo ton-miles 267,000; mail ton-miles 30,400. Telephones (Bangkok, 1948): 5,586. Radio receiving sets (1950): 100,000.

Agriculture.—Main crops (metric tons, 1950): rice 6,018,000; sugar, raw value 73,000; groundnuts 55,000; tobacco 21,300; cotton 6,000; jute 3,000 (1949); cottonseed 30,000; soya beans 8,000; sesame 1,900. Livestock (Dec. 1949): cattle 5,000,000; pigs 2,000,000; buffaloes 5,000,000; horses 230,000.

Industry.—Electricity production in Bangkok (1950): 53,000,000 kw.hr. Raw materials (metric tons, 1950): rubber (net exports) 114,019; tin in concentrates 10,529; cement 165,000.

Theatre. Although 1951 marked no notable progress in the development of the U.S. drama, the American theatre—fighting hard against the powerful odds of television, radio and motion picture competition and saddled with increasing production costs and exorbitant taxes—held its own and thrived financially if not always artistically. In New York city the chronic theatre shortage continued, but there was no shortage of theatre goers for the favoured offerings. *The King and I* and *Top Banana* of 1951 and *Guys and Dolls* and *South Pacific*—held over from previous seasons—earned from $44,000 to $50,000 weekly.

Sidney Kingsley turned an Arthur Koestler novel of the 1937 Moscow treason trials, *Darkness at Noon,* into a play and with it won the Drama Critics' Circle award, though the general public was less enthusiastic despite a fine performance by Claude Rains as the imprisoned former commissar. A second critical choice was Louis O. Coxe's and Robert Chapman's *Billy Budd,* based on the famous Herman Melville short story of martyred innocence. Though a better play than Kingsley's, it met a similar fate at the box office. Tennessee Williams' smothering melodrama of passion among the Sicilian emigrants living along the Gulf coast, *The Rose Tattoo,* was more successful.

Lillian Hellman's tragic-comedy of wasted lives, *The Autumn Garden,* contained much muddled writing and some excellent acting by Florence Eldridge, Ethel Griffies and Fredric March. Robert E. Sherwood's doctoring of Philip Barry's last play, *Second Threshold,* failed to enliven a weak script, and neither Arthur Miller's version of Ibsen's *An Enemy of the People* nor Paul Green's version of Ibsen's *Peer Gynt* were improvements on the earlier translations by William Archer. John van Druten made a skilful adaptation of some Christopher Isherwood stories of pre-Hitler Berlin in *I Am a Camera,* and Paul Osborn's adaptation of John P. Marquand's novel, *Point of No Return,* served Henry Fonda as a useful acting vehicle.

Elmer Rice wrote a comedy of a spinster schoolmarm's European holiday in *The Grand Tour* and Maxwell Anderson a pretentious drama of Socrates' life in *Barefoot in Athens.* There were amusing moments in John Patrick's ghost play, *Lo and Behold,* which Leo G. Carroll acted delightfully, and a two-character play of married life, *The Fourposter*—from the Dutch of Jan de Hartog—caught the paying public's fancy. *Remains to be Seen,* a murder play by Howard Lindsay and Russel Crouse with the motion picture actor Jackie Cooper in the leading role, and *Love and Let Love,* by Louis Verneuil with another cinema performer, Ginger Rogers, were moderately profitable ventures. A greater success was *The Moon Is Blue,* a light sex play by F. Hugh Herbert, and a comedy-drama of life in a German prison camp during World War II, *Stalag 17* by Donald Bevan and Edmund Trzcinski, enjoyed a long engagement.

The musical-comedy stage fared better financially than the nonmusical-comedy stage. There was a new and brilliant show by Richard Rodgers and Oscar Hammerstein, *The King and I,* based on Margaret Landon's novel, *Anna and the King of Siam,* in which Gertrude Lawrence was Anna and Yul Brynner the king. Beautifully staged and possessing a melodious score, it towered above its rivals. There were musical versions of Booth Tarkington's *Seventeen,* Betty Smith's *A Tree Grows in Brooklyn* and Ferenc Molnar's *The Good Fairy* (known as *Make a Wish*) and all were of the second order. There was a huge musical of the California gold rush days, *Paint Your Wagon,* with James Barton, and a hilarious one of a burlesque comedian who enters the television studios, *Top Banana,* with Phil Silvers. Bert Lahr and Dolores Gray were seen in a rather commonplace but successful revue, *Two on the Aisle,* and there was a pleasant revival of Jerome Kern's 20-year-old operetta, *Music in the Air.*

There were some interesting importations and many revivals. An Irish play, *The King of Friday's Men* by Michael J. Malloy was botched by poor staging. The American National Theatre and Academy (ANTA) brought Louis Jouvet and his Parisian Athène theatre company to Broadway in Molière's *L'Ecole des Femmes.* The D'Oyly Carte company in its repertory of Gilbert and Sullivan operas again visited the United States, and *The House of Bernarda Alba,* by Federico Garcia Lorca was given a production in English.

The New York City Theatre company revived Shaw's *Captain Brassbound's Conversion,* G. S. Kaufman and Edna Ferber's *The Royal Family,* Maurice Evans in *Richard II,* Elmer Rice's *Dream Girl,* Robert E. Sherwood's *Idiot's Delight* and a Margaret Webster production of *The Taming of the Shrew.* ANTA brought back *Twentieth Century* by Ben Hecht and Charles MacArthur to star Gloria Swanson and José Ferrer, James M. Barrie's *Mary Rose* and *Night Music* by Clifford Odets, in addition to staging Edmund Wilson's curious play, *The Little Blue Light.* The Drama Quartette—Charles Laughton, Charles Boyer, Cedric Hardwicke and Agnes Moorehead—gave a reading of the "Don Juan in Hell" portion of Shaw's *Man and Superman* at Carnegie Hall and won such admiration that the reading was subsequently staged for an extended run. Mordaunt Shairp's *The Green Bay Tree, Springtime for Henry* with Edward Everett Horton, Mae West in *Diamond Lil* and Somerset Maugham's *The Constant Wife* with Katharine Cornell were other plays of former seasons to play return engagements.

The year closed impressively with the arrival of Laurence Olivier and Vivien Leigh and their London company in productions of Shakespeare's *Antony and Cleopatra* and Shaw's *Caesar and Cleopatra.* (T. Q. C.)

Statistics of the Theatre in New York City

	1951	1950
Productions	106	99
Musical comedies	29	28
Plays	77	71
Premières	52	47
Successful productions	19	20
Performers employed	1,852	1,873
Tickets sold	8,900,000	9,200,000
Approximate cost of production	$4,300,000	$4,100,000
Number of shows booked for other cities	67	68

Canada.—Canadian drama participants and supporters were disappointed when the report of the Massey royal commission on culture was published, for the commission was against the early building of a national theatre. However, the commission did favour "modest help from federal sources" to drama groups. The 12th national drama festival was held in London, Ont., and winners were: Bessborough trophy (highest) to Les Compagnons de St. Laurent (Montreal) for André Obey's *Les Gueux au paradis;* festival plaque (best French performance, excluding Bessborough), to Les Compagnons de Notre Dame (Trois Rivieres) for *Ma Petite ville,* a translation of Thornton Wilder's *Our Town;* festival plaque (best English performance, excluding

Bessborough), to Little theatre (Welland) for Sean O'Casey's *Juno and the Paycock;* Henry Osborne trophy (best male actor) to John Calicos for King Charles in the Shavian play; Nella Jefferis trophy (best female) to Doreen Richardson as Janet Spence in *The Gioconda Smile.*

Toronto's third annual open-air Shakespeare festival was a success.

The Canadian repertory theatre of Ottawa, the nation's only professional company, concluded a notably well-supported third season. Joseph Schull's *Shadow of the Tree* won the London little theatre's nationwide $1,000-prize competition. (C. Cy.)

Great Britain and Europe.—In the British theatre in 1951 the Festival of Britain exerted a great influence. Festival visitors had the chance to see almost all the best-known London actors and actresses, most of them in well-tried classical parts carefully chosen: Laurence Olivier and Vivien Leigh in the title roles in Bernard Shaw's *Caesar and Cleopatra* and Shakespeare's *Antony and Cleopatra;* John Gielgud, Diana Wynyard and Flora Robson in Shakespeare's *The Winter's Tale;* John Clements and Kay Hammond in Shaw's *Man and Superman,* with the long "Don Juan in Hell" act included on special occasions for playgoers of special stamina; Ralph Richardson, Margaret Leighton and Celia Johnson in Chekhov's *Three Sisters;* Alec Guinness as *Hamlet;* the Old Vic Company, with Peggy Ashcroft as Euripides' Electra and Shakespeare's Mistress Page, and Roger Livesey and Ursula Jeans in Shaw's *Captain Brassbound's Conversion;* Godfrey Tearle in Sir Arthur Pinero's *His House in Order;* and, in the offing, the Stratford-on-Avon Shakespeare company.

Only one new play by a British dramatist was staged during the festival season, Peter Ustinov's *The Love of Four Colonels* (Wyndham's, May 23). This was a flight of purely theatrical fancy, a satirical fairy tale which involved parodies of various types of play, and whose success could not have been foretold with any certainty. Fortunately, the jest came off, and the play ran strongly throughout the season. Another piece from Peter Ustinov's pen, *The Moment of Truth,* produced at the Adelphi on Nov. 21, after the festival was over, aimed higher but did not hit its target so cleanly.

At the Edinburgh festival, drama was represented by, among other productions, Sir David Lindsay's 16th century morality play *Ane Satyre of the thrie Estaitis* and Thomas Kyd's *Spanish Tragedy.* (W. A. Dn.)

France.—Although there was much talk of *crise* (hysteria) in French theatrical circles, there was also evidence of great activity. Jean Anouilh's *Colombe* was not considered one of his good plays, nor did Jean-Paul Sartre's *Le Diable et le Bon Dieu,* or Jean Cocteau's *Bacchus* attain to the best standards of either writer. A modest presentation by the Georges Vitaly company of Georges Schéhadé's *Monsieur Bob'le* was hailed by many for its poetic qualities. Other successful plays of the year: *Lorsque l'Enfant paraît,* by André Roussin; *Le Complexe de Philémon,* by Jean-Bernard Luc; *Ami-Ami,* by Pierre Barrilet and Jean-Pierre Grédy; *Un Soir à Samarcande,* by Jacques Deval; *La Belle Rombière,* by Jean Clervers and Guillaume Hanoteau, offered little else than light entertainment. Notable exceptions were the Jean-Louis Barrault production of Paul Claudel's sombre *L'Echange* (1893), and Raymond Hermantier's presentation in French of Friederich Schiller's *Marie Stuart.* (M. Jol.)

Germany.—New German authors of distinction were slow to appear, and the lack of good new plays led to a revival of interest in little-known works of authors of the previous generation. Heinz Hilpert produced a new version of Hugo von Hofmannstahl's *Der Turm* at the second annual festival at Monschau, and Nuremberg saw the first performance of *Der Graf von Ratzeburg* by Ernst Barlach.

SCENE FROM *GUYS AND DOLLS,* which won triple honours as the best musical comedy of the 1950–51 season, including the award of the New York Drama Critics' circle. The book was by Abe Burrows and Jo Swerling; music, by Frank Loesser

An important addition to the number of established festivals was that held in western Berlin in September. Among dramatic contributions, Boleslaw Barlog's production of Schiller's *Wilhelm Tell* appropriately opened the new Schillertheater, and was followed there by the first performance in Berlin of Carl Zuckmayer's *Der Gesang im Feuerofen.* (R. H. Cn.)

Films of 1951.—*Curtain Call* (Encyclopædia Britannica Films, Inc.); *Life Hangs by a Thread* (Brandon Films, Inc.); *On Stage* (The March of Time Forum Films); *Producing a Play Series* (7 films) (International Film Bureau, Inc.); *Summer Theatre* (Almanac Films, Inc.).

Theiler, Max (1899–), South African-U.S. medical scientist, was born on Jan. 30 at Pretoria, U. of S.A. He studied at Rhodes University college and at the medical school of the University of Capetown from 1916 to 1918, then went to England to continue his medical studies. He received his diploma from the London school of tropical medicine and hygiene in 1922 and in the same year became a member of the Royal College of Surgeons. In 1923 he accepted a teaching position in tropical medicine at Harvard university medical school and remained in the United States thereafter, although he did not become a U.S. citizen. In 1930 he became a staff member of the international health division of the Rockefeller foundation. There he continued the research he had begun at Harvard with the virus of yellow fever. In 1939, after many experiments in inoculating mice and monkeys with the yellow fever virus, he discovered the vaccine called 17-D which proved successful in combating the disease.

During World War II the vaccine was used extensively; in the years 1940–47 alone the Rockefeller foundation prepared 28,000,000 doses of 17-D for free distribution among troops and civilian personnel of the Allied governments. For this and related work Theiler on Oct. 18, 1951 was named winner of the 1951 Nobel prize in physiology and medicine.

Tibet. A country of central Asia, north and northeast of the Himalayas, Tibet is nominally a Chinese dependency. It had been in practice independent and was the only country in the world entirely under ecclesiastical control. Area: *c.* 469,294 sq.mi. Pop. (1948 est.): *c.* 3,000,000. Capital: Lhasa. Language: Tibetan. Religion: Buddhist. Ruler: Ling-Erh-La-Mu-Fan-Kha (formerly Lhamo Dhondup), the 14th dalai lama, born June 6, 1935, and enthroned in the Petala, or chief palace, on Feb. 13, 1940.

History.—The year 1951 opened with the Chinese Communist troops still little further than Chamdo and the dalai lama encamped at Phari Dzong, on the border of Sikkim. Reassuring messages were sent to him from Peking, and on May 23 a treaty was signed in Peking providing for the establishment of a Chinese military and administrative mission in Tibet, the maintenance of the dalai lama's authority, but the return to Tibet of the panchen lama (born in 1937 at Yuehsang, Chinghai province, or Tuteng Chueh-chi) and an undertaking by Tibet to unite behind the Chinese People's government's policy of opposing "imperialism."

Gen. Chang Ching-wu, the leader of the Chinese mission and one of the four signatories of the treaty on the Chinese side, arrived in Lhasa on Aug. 8 and declared that the interests of Tibetans would be carefully considered. Reports showed that the Chinese had started to build roads, lay down airstrips and link up key towns with radio communication.

On Aug. 17, the dalai lama returned to his capital at Lhasa. His supremacy in the secular sphere seemed to have been preserved despite the expected return of the panchen lama, who by end of the year was still at Sining (Chinghai), awaiting the word to cross the border to return to his monastery of Shigatse. It seemed probable that the panchen lama, theoretically a living deity, who ruled the spiritual lives of 10,000,000 lamaist Asians, was the tool of Chinese policy. A Chinese force of 3,000 entered Lhasa on Oct. 26.

On the whole, the year 1951 marked the end of Tibetan independence. Kalon Ngabo Ngavang Jigme and his four colleagues who signed the Peking treaty on the Tibetan side were obviously hoping that, for the price of surrendering to China the direction of foreign relations and defense, Tibet would be permitted to manage its domestic affairs. By the end of the year, however, this hope seemed slender. (E. HD.; X.)

Tin. World tin production increased each year after 1945, and in 1950 was only 3% below the 1940–44 average; but it still fell far short of the prewar outputs. The mine production of the major producing countries is shown in Table I, as reported by the U.S. bureau of mines.

United States.—The salient features of the tin industry in the United States are summarized in Table II.

Table I.—*World Mine Production of Tin*

(In short tons)

Titanium: *see* MINERAL AND METAL PRODUCTION AND PRICES.

Tito (JOSIP BROZOVICH OR BROZ) (1892–   ), Yugoslav prime minister, was born on May 25 at Kumrovec, Croatia. He served in the Austro-Hungarian army in World War I, was captured by the Russians, and in 1917 he joined the Red army and fought against anti-Communist Russian armies. In 1920 he was sent by the Comintern to Yugoslavia to organize the Communist party there. From 1928 to 1934 he was imprisoned for conspiracy, and in 1937 he became secretary-general of the Yugoslav Communist party. After the Germans overran Yugoslavia in 1941, Tito organized a leftist guerrilla group which effectively harried the axis occupation forces. Yugoslavia was liberated early in 1945, and Tito, who had appointed himself marshal, became prime minister and commander in chief. On June 28, 1948, the Cominform published a statement denouncing Tito for his "hateful policy in relation to the U.S.S.R." But from a correspondence between Belgrade and Moscow published later it was possible to learn that the real core of Tito's heresy was his brand of Yugoslav patriotism. "Even though we love the U.S.S.R. we cannot love our own country less," wrote Tito to Stalin on April 13, 1948. On Oct. 29, 1950, he paid tribute to the U.S. government, which was helping Yugoslavia in its food crisis without imposing any political obligations.

During 1951 Tito pursued his qualified approach to the west. Yugoslavia, he said, would fight "when aggression occurs and when, as a result, the independence of our country is threatened." This was amplified to refer to "not only . . . a direct attack against this country, but also one against Europe as a whole." In March he called on the west to withdraw from Korea because the war was "strategically futile," and in October protested against western attempts to "poison our people with propaganda."

Tito sought friendlier relations with Greece, and made a new approach to Italy on the Trieste question. On Nov. 14 he and George V. Allen, the U.S. ambassador, signed at Belgrade an agreement providing that the United States would "make or continue to make available" to Yugoslavia military equipment, materials and other services. (R. JAN.)

Tobacco. The U.S. 1951 crop of all tobaccos of 2,282,386,000 lb. was the second highest of record and comparable with 2,030,645,000 lb. in 1950 and an average for 1940–49 of 1,787,136,000 lb. A harvested acreage of 1,782,000 was 11% more than in 1950, but below the 1,829,000 ac. officially allocated. Yields, over-all, were a new record of 1,281 lb. per acre. The total value to producers of the 1951 crop was estimated at $1,178,203,000, compared with $1,048,639,000 in 1950.

The class I flue-cured types, produced mainly in the southeast coastal plain area and used in cigarettes and for export,

Table I.—*U.S. Tobacco Production by Leading States*

(In thousands of pounds)

State	1951	1950	Average 1940–49	State	1951	1950	Average 1940–49
North Carolina.	978,620	875,990	701,601	Fennsylvania . .	55,127	55,960	52,486
Kentucky . . .	444,094	363,525	395,536	Maryland . . .	42,900	40,000	32,966
South Carolina.	177,540	150,480	121,759	Florida	32,392	23,268	19,296
Virginia . . .	175,330	165,496	131,971	Ohio	24,555	24,610	24,361
Georgia . . .	136,806	102,120	90,527	Wisconsin . . .	23,576	31,434	32,968
Tennessee. . .	135,083	132,810	126,185	Connecticut. . .	22,111	27,806	23,688

amounted to 1,434,000,000 lb. (more than 60% of the total crop), 14% more than in 1950. Acreage harvested was increased to 1,110,100, 16% greater than in 1950. Yields, however, declined to 1,291 lb. per acre from the record of 1,312 lb. in 1950. Carry-over of these types amounted to 1,558,000,000 lb. on July 1, about 5% more than a year earlier. Early season auction market prices for all flue-cured types combined averaged 52.2 cents per pound, compared with 54.9 cents per pound in the early part of the 1950 season. The 1951 price support was 50.7 cents per pound; only 6% of the 1950 crop was placed under government loan.

Class II fire-cured types, produced mostly in Kentucky and Tennessee, yielded 62,451,000 lb., an increase of 6% compared with 58,698,000 lb. in 1950; the average for 1940–49 was 77,702,000 lb. Acreage of 51,000 was low compared with 53,000 in 1950 and 76,000 average for the previous decade, but yields were sharply higher: 1,225 lb. per acre compared with 1,108 lb. in 1950 and 1,030 lb. for 1940–49. The support price on the 1951 crop was 37.4 cents per pound.

The 1951 burley-type tobacco crop of 583,341,000 lb. was 17% larger than in 1950 and even larger in relation to the 487,860,000-lb. average for 1940–49. Harvested acreage of 455,600 was 12% larger than the 408,300 ac. of 1950 and well above the 425,590 ac. for 1940–49. The yield of 1,280 lb. per acre was also higher than the 1,222 lb. of 1950 or the previous decade average of 1,135 lb. The carry-over on Oct. 1 was 964,000,000 lb. It was anticipated that prices on the 1951 crop would exceed the average of 48.9 cents per pound received by growers for the 1950 crop.

The southern Maryland tobacco (type 32) crop of 1951 was 42,900,000 lb., compared with 40,000,000 lb. in the previous year and an average for 1940–49 of 32,966,000 lb. Carry-over supplies on Oct. 1 were 63,300,000 lb., a record high. The price on the 1950 crop averaged 47.8 cents per pound, a slightly lower figure than the 48.3 cents of the previous year.

The 1951 crop of dark, air-cured type tobacco was 33,471,000 lb., more than the 28,649,000 lb. of 1950 but below the 1940–49 average of 38,521,000 lb. Acreage (28,000) was slightly below 1950 and sharply under the 1940–49 average of 36,690; yields per acre of 1,195 lb. were much above the 998 lb. of 1950 and the average for the previous decade of 1,054 lb. The Oct. 1 carry-over was estimated at 73,400,000 lb., or 8% lower than a year earlier. The price support level for the 1951 crop was 33.2 cents per pound.

Cigar types in 1951 were produced to the extent of only 126,309,000 lb., compared with 146,845,000 lb. in 1950 and 135,364,000-lb. average for 1940–49. The acreage of 85,200 was off sharply compared with 100,700 ac. in 1950, but yields of 1,482 lb. per acre were moderately higher than in 1950 or the average for 1940–49.

Exports of tobacco leaf in 1950–51 amounted to 471,092,000 lb., valued at $273,262,000, representing, compared with the previous year, a 2% decrease in quantity and a 16% increase in value. Imports of tobacco leaf, especially for use in cigar wrappers and cigarettes, increased to 88,340,000 lb., valued at $75,821,000, from 80,642,000 lb. valued at $70,275,000 in the previous year.

Table II.—*Tobacco Production of the Principal Producing Countries*

(In thousands of pounds)

Country	1951*	1950	Average, 1935–39	Country	1951*	1950	Average, 1935–39
United States. .	2,282,386	2,030,645	1,460,054	Turkey .	210,000	186,229	128,505
India . . .	—	551,040	761,600	Italy . .	165,000	173,396	95,511

Japan. . .	—	216,459	148,680	Greece .	139,324	128,043	132,819
				France. .	121,253	116,945	72,995

*Year beginning July 1.

Cigarettes, which absorb three-fifths of the annual disappearance of U.S. tobacco, attained a new record output in 1951 of 412,000,000,000, about 5% more than in 1950. About one-tenth of the total was exported to foreign countries or U.S. forces overseas. The excise tax was increased in November from seven to eight cents per pack. Cigar consumption was estimated at 5,800,000,000, a gain of 5% over 1950.

The world tobacco crop for 1951–52 was forecast at 7,435,000,000 lb., 6% more than the 7,125,000,000 lb. of the previous year and substantially more than the prewar average of 6,597,000,000 lb. Six hundred delegates from 43 countries met in Amsterdam, Neth., in September in a world tobacco congress.

Tobin, Maurice Joseph (1901–), U.S. secretary of labour, was born in Roxbury, Mass., on May 22. He worked for the New England Telephone and Telegraph company for a number of years, served in the Massachusetts legislature, 1927–28, was mayor of Boston, 1937–44, and governor of Massachusetts, 1944–46. In 1948 Pres. Harry S. Truman appointed him secretary of labour.

On April 26, 1951, Tobin announced that the U.S. would need 7,200,000 more men and women in defense industry and the armed forces by the end of 1952. On June 18 he issued a ruling making it possible for small manufacturers to pool their resources to obtain government contracts. Later in the year he advised white-collar workers to organize into unions, pointing out that they received an average of $15 a week less in wages than unionized factory workers.

Toronto. Preliminary figures for the 1951 census gave Toronto a population of 670,945; greater Toronto, 1,108,532, compared with 909,928 for 1941, which revealed that Toronto's rate of growth was only a little more than half that of Montreal. During the year the amalgamation issue, the subway development and the housing shortage were among the main topics of interest. Year-long hearings by the Ontario Municipal board of Toronto's application for union with its 12 suburbs concluded early in June. By the end of the year the board had not announced a decision.

The study of city zoning begun in 1937 resulted in a 1951 report that recommended ten types of zones which did not disturb existing or projected building. A tax rate of 39.3 mills, highest in Toronto's history, was struck; the real assessment for 1951 tax purposes was set at $1,187,058,103, which was $22,219,120 over the 1950 figure, plus about $215,000,000 of business assessment. Indicative of the housing construction situation in the city was the report that during the month of November alone home building was down 31% compared with Nov. 1950.

Subway construction proceeded throughout the year, and, forecasting early completion of the job, a $4,000,000 contract for 11 of the 12 underground stations was negotiated. The Toronto Transportation commission boosted its fares in the hope of getting $6,300,000 additional revenue to overcome an expected 1951 $3,000,000 deficit and provide for additional capital outlays. School enrolment dropped off in 1951, indicating that Toronto was becoming a city of older people; nevertheless, the city's education budget was $21,400,000 for 1951–52, or $3,300,000 over the year before. (C. Cy.)

Torp, Oscar

(1893–), Norwegian prime minister, was born at Skjeberg, Östfold, on June 8. He was educated at an evening technical school as an electrician, and at 16 was an active trade union official. In 1918 he was elected a member of the executive committee of the Norwegian Labour party, which a year later joined the third (Communist) international. In 1922 Torp represented the Norwegian Labour party at the Comintern congress in Moscow, but in 1923 the party withdrew from this organization and Torp was elected its chairman; he remained in that office for the next 17 years. In 1934 he was also chairman of the Oslo municipal council and the next year was elected mayor of the capital but resigned after a few months when, as deputy minister of defense, he joined the first Labour government headed by Johan Nygaardsvold. From Nov. 1936 he served as minister of social affairs and from July 1939 as minister of finance. He kept this portfolio when the Norwegian government moved to London in 1940, but in 1942 became minister of defense. In Nov. 1945 he joined the new Labour government formed by Einar Gerhardsen as minister of supply and reconstruction but left the cabinet in Nov. 1947 to become chairman of the Labour group in the *storting*. Chiefly concerned with questions of defense and foreign policy, he accompanied Halvard Lange, the foreign minister, to Washington, D.C., in 1949 during the talks that preceded Norway's joining the North Atlantic treaty. In Nov. 1951 he succeeded Gerhardsen as prime minister.

Torquay Trade Conference: *see* TARIFFS.

Tourist Travel.

The number of Americans taking vacation trips climbed to a new peak during 1951, and so did the gross national travel expenditures. Estimates of the American Automobile association were that 72,000,000 persons travelled and spent approximately $12,000,000,000 travelling. As an industry, vacation travel came to rank with the country's biggest; more important in terms of national influence, almost half the population took at least one trip during 1951.

An important factor in this trend was the uninterrupted mass production of passenger automobiles, of which there were more than 43,000,000 in the U.S. in 1951. Approximately 85% of all vacation travel was by automobile, with an even higher percentage by that means to the national parks.

The average tourist automobile carried three occupants, covered 1,000 mi. in nine days of travel, with each occupant spending close to $150 while away from home. A breakdown of the motor vacationist's dollar showed that 25 cents went to retail purchases; 41 cents for food and lodging; 20 cents for transportation costs (gasoline, oil and automotive parts); 8 cents for theatre and other amusements; and 6 cents to confectioners and wayside stands.

Reflecting the heavy volume of automobile travel was an upsurge in construction of overnight accommodations along the roadside. The A.A.A. estimated a total of 40,000 motor courts in operation, while association field reporters noted a 50% rise in this type of facility in many sections. Among regions that experienced a heavy tourist building boom were Miami Beach, St. Petersburg and Daytona Beach in Florida, and Tucson and Phoenix in Arizona. Major new travel arteries were open to motor traffic during the year while construction work on others indicated they would be ready for use soon. (*See* ROADS AND HIGHWAYS.)

The 1951 travel year was marked also by the spread of the vacation period, which once was largely known to start with Decoration day and to end with Labor day. Many resorts were open in May and operating profitably until October. The inducements of "off-season" travel included reduced rates, wider choice of accommodations and less crowded highways. Perhaps the best example of 1951 off-season vacationing was in Florida, traditionally and almost solely a winter playground. The summer season, however, broke all previous records and for the first time almost equalled the winter months in terms of tourist volume.

Canada continued to be the major foreign objective of U.S. travellers, accounting for almost two-fifths of all travel expenditures outside the country. The number of passenger cars entering Canada with traveller's vehicle permits (distinguished from local traffic) was more than 2,000,000. Ontario led the provinces in attracting visitors, followed by Quebec and British Columbia. Alaska also was host to a large number of U.S. tourists and sought to draw more; the territorial legislature appropriated $40,000 for a tourist promotion program and a $3,000,000 hotel, Alaska's newest and biggest, opened in Fairbanks.

Mexico drew nearly 300,000 visitors by all means of transportation, two-thirds by private passenger car. The Mexico City chamber of commerce estimated that foreign travellers in the country spent $100,000,000, and the Mexican government statistical bureau reported that *turismo* was second only to agriculture as a revenue producer.

The islands of the West Indies, participating in a joint promotion program through the Caribbean Interim Tourist committee, enjoyed their biggest travel year. Old hotels were renovated and new ones were built in Cuba, Haiti, Jamaica, the Virgin Islands, Puerto Rico and Tobago. Air lines increased their schedules to these islands and more major cruise vessels visited the Caribbean than in any previous postwar year.

An all-time record number of travellers, citizens returning home and aliens coming from other countries, arrived in the United States during the fiscal year ending June 30, according to figures furnished by the immigration and naturalization service on the basis of passenger manifests used by all ships and planes. The total number of passengers was 1,274,878, an increase of 8% over the previous high set in 1950. The number of citizens was 745,155.

Europe ranked as the principal travel destination for Americans, with a total of 284,401. Steamship passengers totalled 177,688 and air passengers 106,713. The European travel year, however, was marked by an early slump, attributable to international tensions, and followed by an unusual upsurge in the late summer and early fall.

Motor touring abroad reached a new high in popularity, according to a report of the A.A.A.'s international travel department, which showed that nearly 4,000 tourists shipped their cars overseas, while others rented or purchased cars for use on arrival. A survey revealed that Americans driving in Europe spent an average of 11 weeks in touring at least four countries. (*See* also AMERICAN CITIZENS ABROAD; NATIONAL PARKS AND MONUMENTS.) (Ru. E. S.)

Town and Regional Planning.

The delegates to the council meeting of the International Federation for Housing and Town Planning, held at Hoddesdon, Eng., July 14–18, 1951, received reports on the progress of planning and housing in Great Britain and Europe.

The Festival of Britain, on the south bank of the Thames, stressed Britain's contributions to civilization, and concurrent celebrations throughout the British Isles included literary, scientific, artistic and dramatic presentations. The living exhibit at Lansbury in east London was a major redevelopment project. In the accompanying temporary exhibit, a "gremlin garage" demonstrated many common mistakes in construction and the Building Research pavilion showed how the faults could be corrected. In the Town Planning pavilion the battle for the land illustrated the many and often-conflicting uses for land. The ways in which the new towns were meeting the needs of the people were graphically presented. At Harlow, Stepney, Stevenage, Hatfield and in Welwyn, as well as in other new towns, progress was made in attracting industry and inhabitants from congested areas. By comparison with the new towns, the garden cities of Welwyn, Letchworth and Bournville, established a generation before, made a good showing in the summer of 1951.

Throughout Britain the county planning offices were engaged in developing area plans for submission to the ministry of housing and local government, as required by law.

In the United States, many cities prepared revisions of their zoning ordinances, embodying more realistic commercial districts, protected industrial districts, integration of zoning with urban redevelopment, off-street parking and loading, sharp curtailment of spot zoning and extension of zoned areas into the country.

Only a few of the proposed ordinances were enacted into law, pending consultations with citizen groups.

As the need for new and enlarged airports became apparent, the Civil Aeronautics administration of the department of commerce, as well as many cities, studied the factors for selecting locations and the effect of airports on surrounding land uses. Many suburban and regional shopping centres were developed but, in 1951, it was apparent that former estimates for space needed for off-street parking and loading had been too low.

Park Forest, Ill., as reported in the 1950 *American Planning and Civic Annual* and in the May 1951 *Architectural Record*, was a completely new town near Chicago which had attracted a good deal of attention. The town, which adjoins the Sauk Trail forest preserve, consisted of a tract of 2,500 ac., of which 1,500 ac. were being developed. Provision was made for about 3,000 rental units and ultimately there would be 5,000 homes for sale.

There was a shopping centre and "an industrial park for light industry."

The federal government designated certain critical areas in connection with defense production where construction of housing might proceed. In Bucks county, Pa., where the U.S. Steel company was building a $400,000,000 plant, the building of 16,000 houses was announced.

Redevelopment plans had been prepared or adopted in many cities and some land had been assembled, but in most cases construction was awaiting the release of critical materials. (*See* also ARCHITECTURE; HOUSING.)

Track and Field Sports.

The year 1951 was marked by many outstanding feats and more international competition than ever was held in a single campaign. United States pole vaulters captured the headlines when Bob Richards of the Illinois Athletic club soared over 15 ft., an achievement which had not been accomplished by any athlete since Cornelius Warmerdam, the world's first vaulter to reach that height. Richards won at 15 ft. 1 in. in the Millrose games at Madison Square Garden, Jan. 27, and five other times indoors he went over 15 ft., his best effort coming in the *Chicago Daily News* meet March 17 when he won at 15 ft. 4¾ in. Richards added to his laurels by capturing the national decathlon championship with 7,834 points, a total exceeded by only two others in history.

Winning Amateur Athletic union crowns indoors and out as well as a title in the first Pan-American games, Richards won acclaim as the nation's athlete of the year and received the James E. Sullivan Memorial trophy presented annually to the amateur who by performance and good influence does the most to promote good sportsmanship.

Jim Fuchs of the New York Athletic club pushed his own shot-put mark up to 58 ft. 3½ in. and Tom Bane of Tufts college hurled the 35-lb. weight 60 ft. 11 in. for new indoor records. Henry Dreyer of the New York Athletic club set an American record for the 56-lb. weight with a toss of 41 ft. 7½ in. Although he retained his championship indoors, Fuchs was dethroned in the national A.A.U. outdoor games at Los Angeles, Calif., when Parry O'Brien of the Los Angeles Athletic club put the shot 55 ft. 9¼ in., the defeat being the first for Fuchs in 89 meets.

Fred Wilt, New York Athletic club, was the nation's leading distance runner and ended the long string of mile victories by Don Gehrmann when he won by six yards in 4 min. 8.4 sec. in New York city March 3. Gehrmann, a former University of Wisconsin ace, who had taken 39 consecutive mile races in three years, retired in the spring and Wilt became the leading Olympic hope. Wilt was timed at 8 min. 54.5 sec. for the fastest two miles ever covered by an American and won the national A.A.U. indoor mile and the outdoor 5,000-m. titles.

Roscoe Browne of the Pioneer club of New York city, who won the A.A.U. 1,000-yd. laurels, turned in the fastest time of the year, 1 min. 49.3 sec., for 800 m. in an overseas meet and did 2 min. 25.2 sec. for the best of the season at 1,000 m. Frank Held, San Francisco Olympic club, threw the javelin 249 ft. 8½ in. while overseas for the longest toss anywhere in 1951. Malvin Whitfield gained his third straight title in the A.A.U. 800-m. race when he defeated Browne.

Jim Golliday, a Northwestern university freshman, George Brown of the University of California at Los Angeles and J. Lewis Hall of the University of Florida were among the newcomers to sparkle. Golliday, a star abroad until he injured a leg, reached the heights in the United States outdoor games at Los Angeles June 22–23 when he tied the championship record of 10.3 sec. for 100 m. With Andy Stanfield of Seton Hall slowed by injury, Golliday gained distinction as the season's top sprinter. Stanfield, however, remained as a stellar performer, winning the A.A.U. indoor broad jump and the Intercollegiate A.A.A.A. 100-yd. and 220-yd. outdoors and 60-yd. sprint and broad jump indoors. George Brown, the National Collegiate Athletic association and A.A.U. champion, jumped into the distinguished group that had surpassed 26 ft. by leaping 26 ft. 1 in. Hall shone among the high jumpers, annexing the N.C.A.A. and A.A.U. titles, his best effort of the year being 6 ft. 8 in.

With the retirement of Gehrmann, whose indoor 4 min. 7.5 sec. was tops for the campaign, the mile again became an open event. Warren Druetzler, Michigan State college, moved into the front ranks in taking the N.C.A.A. run in 4 min. 8.8. sec., and

PHOTOTIMER PICTURE recording the finish of a 60-yd. high hurdles race at Madison Square Garden, New York city, in Feb. 1951. The phototimer camera had long been used in horse racing

Leonard Truex, young Ohio State university star, carried off the national 1,500-m. crown in 3 min. 52 sec. Highlight for the milers, however, came on April 28 at Philadelphia, Pa., where Roger Bannister of England defeated both Wilt and Gehrmann in a special race. The visitor set a record for the Penn relays by winning in 4 min. 8.3 sec.

Wilt was 15 yd. back and Gehrmann 30 yd. behind as the victor broke the tape.

In team competition, the Pioneer club of New York city ended the reign of the New York Athletic club as A.A.U. indoor ruler, and the Los Angeles Athletic club captured laurels outdoors. Southern California retained its N.C.A.A. championship, Manhattan college of New York city took the Intercollegiate A.A.A.A. indoor honours and Cornell university triumphed outdoors. With a new star, Mary McNabb, winning two sprints and aiding the victorious relay team, Tuskegee institute retained the women's A.A.U. outdoor crown. Stella Walsh of Cleveland, O., national broad jump queen, kept pentathlon laurels. The Police Athletic league kept the women's indoor title. Other leading team champions included the following: national A.A.U. junior, Olympic club; Western conference, University of Illinois; Southeastern conference, Louisiana State university; New England intercollegiate, Tufts college; Big Seven, University of Missouri; Heptagonal, Cornell university; Southern conference, University of Maryland; Metropolitan (N.Y.), Manhattan college; Missouri Valley, Oklahoma Agricultural and Mechanical college; Rocky Mountain conference, Kansas State college and University of Colorado (tied); Pacific Coast conference, University of Southern California.

The first Pan-American Sports congress, held at Buenos Aires, Arg., Feb. 25–March 9 saw the U.S. track-and-field team of 128 score a decisive triumph. The men tallied an unofficial 250 points as against Argentina's 192 points, while U.S. women just managed to defeat Chile for the team award, 75–73.

Outstanding U.S. Track and Field Performances (Outdoor), 1951

100 Yd.

9.5 sec.—Ford, Drake; Williams, Los Angeles State; Richard, U.C.L.A.; Blackburn, California
9.6—Stanfield, Seton Hall; Thresher, Mercersburg; Brock, Oregon State; Preston, Louisiana State; Work, U.C.L.A.; Bragg, Morgan State; Field, Duke; Price, Oklahoma; Walker, Falcon club

220 Yd.

20.6 sec.—Stanfield, Seton Hall; McKibben, Occidental
20.7—Rhoden, Morgan State
20.8—Dunn, Wyoming; Green, Los Angeles City college

440 Yd.

46.4 sec.—McKenley, Jamaica
46.5—Rhoden, Morgan State
47.2—Moore, Cornell
47.5—R. Maiocco, New York university
47.7—McSween, Illinois; Whitfield, U.S. air force; Bradley, Southern California

880 Yd.

1 min. 50.7 sec.—Barnes, Occidental
1:51.6—Mitchell, U.C.L.A.
1:52.1—Deady, Georgetown
1:52.5—Eischen, Washington State
1:53.1—Joyce, Georgetown; Mealey, Cornell

One Mile

4 min. 8.3 sec.—Bannister, Great Britain
4:8.8—Druetzler, Michigan State
4:9.0—McEwen, Michigan; McMillen, Occidental
4:10.3—Wilt, New York A.C.
4:10.7—Newcomb, Southern California

Two Mile

8 min. 54.5 sec.—Wilt, New York A.C.
9:3.2—McEwen, Michigan
9:7.7—McGuire, Missouri
9:10.9—McMillen, Occidental
9:11.9—Shea, Army

120-Yd. High Hurdles

13.6 sec.—Attlesey, Los Angeles A.C.
13.7—Davis, Southern California
14.1—Walker, Southern Methodist; Barnard, Southern California
14.2—Demedicis, Auburn
14.3—Hildreth, Arizona State; Triulzi, Santa Barbara; Halderman, Los Angeles A.C.; Brown, Lafayette

220-Yd. Low Hurdles

22.7 sec.—Moore, Cornell
22.9—Attlesey, Los Angeles A.C.; Stanfield, Seton Hall
23.0—Bless, Texas A. and M.; Johnson, Army; Davis, Southern California
23.1—Thomas, Michigan State

Broad Jump

26 ft. 1 in.—Brown, U.C.L.A.
25:9¾—Gourdine, Cornell
25:9—Stanfield, Seton Hall
24:9—Meeks, Texas
24:8½—Hairston, Columbus (O.) High school
24:7¾—Soble, Michigan

Shot-Put

57 ft. 9½ in.—Fuchs, New York A.C.
56:1½—Chandler, Olympic club
55:9¼—O'Brien, Southern California
54:7½—Hooper, Texas A. and M.
54:1½—Anderson, Indiana

Discus

175 ft. 6½ in.—Doyle, Montana A.C.
173:4—Mathias, Stanford
172:4—Frank, Collegiate T. and F. club, Philadelphia
167:5¾—Dillion, Auburn
166:4¾—Anderson, Indiana
165:9¾—Fuchs, New York A.C.

Javelin

241 ft. 11 in.—Young, Los Angeles A.C.
241:0¾—Held, Olympic club
237:10—Miller, Arizona State
232:1½—Seymour, Los Angeles A.C.
228:8½—Missfeldt, Oregon
227:0—Roylance, Brigham Young

Hammer Throw

184 ft. 2¾ in.—Felton, New York A.C.
182:8¼—Dreyer, New York A.C.
179:8¾—Bane, Tufts
177:10¾—Blair, Boston university
174:10⅞—Dillon, New York A.C.
173:5—Backus, Tufts

Pole Vault

15 ft. 1¾ in.—Laz, Illinois
15:0½—Richards, Illinois A.C.
15:0⅛—Cooper, Nebraska
14:6—Jensen, Southern California
14:4—Smith, San Diego State

High Jump

6 ft. 9¾ in.—Holding, East Texas State college
6:9—Davis, Texas A. and M.; Hall, Florida
6:7⅞—Miller, Arizona State
6:7¾—Severns, Kansas State

Trieste, The Free Territory of.

Trieste is a small state at the northern end of the Adriatic sea, between Italy and Yugoslavia, demilitarized and neutral, whose independence was declared from Sept. 15, 1947, by the Security council of the United Nations. Total area: 293 sq.mi. Total pop. (mid-1950 est.): 378,000. Military governors under provisional regime: zone A, British-U.S. (area, 96 sq.mi.; pop., 1949, 299,000), Maj. Gen. Sir John Winterton; zone B, Yugoslav (area, 197 sq.mi.; pop., 1949, 60,000), Col. M. Stamatovitch. Mayor of the city of Trieste: Gianni Bartoli.

History.—Since Trieste was more prosperous than the rest of Italy and since the Allied forces provided much employment which could otherwise not be replaced, many unpolitically minded Triestines genuinely desired the prolongation of the *status quo*, while others wished for the independence and union of the two zones. It was rumoured that the U.S.S.R. favoured the *status quo* as providing an excuse for barring the Austrian peace treaty and that the United States had no great desire to close down the U.S. bases in Trieste; Great Britain certainly had no interest in remaining in the free territory.

In March 1951 Marshal Tito made a speech in which he declared that the time was not ripe for a solution of the question of Trieste, but in April he suggested—what the western powers advocated—direct negotiation between Yugoslavia and Italy. In September the Yugoslav foreign minister, Edvard Kardelj, made several public pronouncements in favour of a compromise with Italy over Trieste. These contrasted sharply with his statements in 1950 and showed that Belgrade now felt it important that the question should really be solved. It was possible that the soviet note handed to representatives of the three western powers on Nov. 17, demanding that the peace treaty be at last carried out in Trieste, was a result of the Kremlin's fear of an Italo-Yugoslav settlement. (E. Wi.)

Finance.—Budget (1951–52 est.): revenue 12,730,000,000 lire; expenditure 15,680,000,000 lire. Monetary unit: lira, with an exchange rate (Aug. 1951) of 1,749 lire to £1 and 625 lire to U.S. $1.

Foreign Trade.—(1950): Imports 25,408,000,000 lire; exports 5,239,000,000 lire. Main sources of imports (1950): U.S. 23.9%; western Germany 5.5%; Austria 3.0%; Switzerland 2.6%. Main destinations of exports: Austria 18.7%; western Germany 11.4%; Greece 2.4%; Turkey 2.2%.

Trinidad and Tobago.

This British colony consists of two islands off the South American continent north of the Orinoco river delta. Area: 1,980 sq.mi. Pop.: (1946 census) 557,970 (27,208 in Tobago); (Dec. 1950 est.) 635,839 (31,000 in Tobago). Languages: English, Hindu, French, Spanish. Religions: Christian 70%; Hindu 23%; Moslem 6%. Chief towns (pop. 1950): Port of Spain (cap., 105,700); San Fernando (32,870). Governor in 1951: Maj. Gen. Sir Hubert Rance.

History.—Abnormally heavy rains during the first half of 1951 caused damage to sugar, cacao, citrus and coffee crops. Further efforts were made to diversify the economy by increased industrialization, and the Cement Industry (Development) act was passed toward the end of the year. Responsible trade unionism made satisfactory progress during 1951, and a new public service commission proved its worth. A local government department was established, and the first local government commissioner, Sir John Imrie, arrived in November.

A steady rise in the cost of living caused concern in Trinidad as in other colonies in the area. A new index of retail prices was to be brought into force early in 1952. The new currency board for the eastern group of colonies, with headquarters in Trinidad, was constituted at the end of 1950, and the first issue of unified currency notes for all the British Caribbean colonies with the exception of Jamaica and British Honduras was made on Aug. 15, 1951.

Education.—Pupils enrolled (1950): elementary 115,300; secondary 5,600. Government expenditure B.W.I. $5,287,000.

Finance and Trade.—Currency: British Caribbean or British West Indian dollar with an exchange value of 58.33 cents U.S. Budget (1951 est.): revenue B.W.I. $55,415,814; expenditure B.W.I. $53,832,725. Foreign trade (1950): imports B.W.I. $169,226,000; exports including re-exports B.W.I. $177,592,000. Production (1950): petroleum 20,632,000 bbl.; asphalt 121,850 tons; rum 2,120,000 proof gal.; cocoa 72,300 tons exported; sugar crop (1951) 140,600 tons. (P. H-My.)

Tropical Diseases.

Trypanosomiasis.—African sleeping sickness presents the single greatest obstacle to the development of the equatorial region of Africa. Destruction of the wild game which act as the reservoirs of the trypanosomes had been advocated as one of the most efficient methods of control, but this procedure had not been universally effective in areas in which it was applied. Aerial spraying of insecticides, on the other hand, had accomplished eradication of the tsetse fly and subsequent disappearance of animal trypanosomiasis.

The drug antrycide proved to be extremely valuable in the treatment of animal trypanosomiasis. Intramuscular injection of pentamidine proved to be the most useful prophylactic agent available up to the close of 1951 for the prevention of the disease in human beings. It was recommended that it be administered once every six months.

Leprosy.—Family studies of the prevalence of leprosy in Java were advanced as evidence that transmission by family contact with a case of nerve leprosy had not been proved. In these studies it appeared that the most important factor influencing transmission within the leper's family is bed contact. The age at which this occurs and its duration are both important. The highest incidence was observed in the age group 0–14. The average duration of the incubation period including the period of bed contact in this age group was three and six-tenths years. After family contact but without bed contact it was seven and two-tenths years.

The sulphones continued to give great promise in the field of treatment. Although relapses occurred after apparent arrest of the disease and discontinuance of therapy, all types of the disease were benefited. In diffuse lepromatous leprosy and in tuberculoid cases small doses were advocated. Treatment should be continued for prolonged periods of time.

Filariasis.—Studies of the effectiveness of hetrazan indicated that this drug was the single most effective weapon in the control of Bancroftian filariasis. It was much less useful, however, in the control of onchocerciasis. In all forms of filariasis eradication or control of the vector must be incorporated in any optimal control operation.

In cases of Bancroftian filariasis, hetrazan was shown to have a permanent effect in reducing or abolishing the microfilariae in the blood, suggesting a lethal or sterilizing effect on the adult worms. Concurrently, there was frequently but not always amelioration of the clinical symptoms including permanent improvement in certain cases of elephantiasis. The drug appeared to be effective in the treatment of loiasis, and it was likewise reported to be of use in creeping eruption.

Hetrazan proved less useful in onchorcerciasis, although it caused disappearance of the microfilariae from the skin in most cases. This action was much slower than that on the Bancroftian microfilariae in the blood, and permanent disappearance occurred much less frequently. Examination of the subcutaneous nodules after treatment showed persistence of many living adult worms.

Schistosomiasis.—Certain phenol derivatives proved to be effective lethal agents against the intermediate snail host in dilutions as low as 9.5 parts per 1,000,000. However, these agents are likewise lethal to fish and most are too expensive for extensive control operations.

The eggs of the parasite are distributed by the blood stream to the liver, spleen and lungs and not infrequently to the brain, where serious lesions may be produced. Those in the lungs are an obliterating inflammation of the small arteries which may lead to heart failure and a clinical picture resembling that of rheumatic or congenital heart disease.

Swimmer's itch was shown to occur in many parts of the world and had become a problem of economic importance in certain resort areas. It is caused by the penetration of the skin of bathers by the infective forms of certain bird schistosomes. The reaction in man is characterized by dermatitis, and in many persons this tends to become more severe with repeated exposure.

Truman, Harry S. (1884–), president of the United States of America, was born at Lamar, Mo., May 8. He was elected to the U.S. senate in 1934, and re-elected in 1940. Elected vice-president in 1944, he became president on the death of Franklin D. Roosevelt on April 12, 1945. He was elected president on Nov. 2, 1948.

The year 1951 was, perhaps, Truman's most difficult year in the White House through aggravation of the "cold war" with the U.S.S.R., the Korean stalemate and casualties that passed 100,000, a series of embarrassing congressional investigations, intraparty dissension and domestic economic pressures resulting from the multibillion dollar rearmament effort.

He asked congress for a $71,594,000,000 budget and $16,500,000,000 in new taxes, though he subsequently reduced that figure to $10,000,000,000. He reiterated demands for enactment of the Fair Deal. A combination of Republicans and southern Democrats reduced the budget by $4,750,000,000 over his protests, raised taxes by only $5,691,000,000 and blocked action on his domestic program.

Early in the year he completed organization of the defense mobilization staff. Charles E. Wilson, former head of the General Electric Company, was director; Eric Johnston, president of the Motion Picture Association of America, Inc., became economic stabilization administrator; and Michael V. DiSalle, former mayor of Toledo, O., director of price stabilization. Their efforts to stabilize the economy provoked protests from labour, industry, consumers and congress.

President Truman's attitude toward the Soviet Union hardened steadily until it gave concern to British and French statesmen lest it provoke another global conflict.

In April, Truman relieved Gen. Douglas MacArthur as United Nations commander in Korea because MacArthur had advocated an all-out war against Korean and Chinese Communists. In a radio speech explaining his action, Truman said that MacArthur's proposals might have provoked World War III.

Congressional exposure of political corruption, favouritism and laxity in the Reconstruction Finance corporation, the department of justice and the bureau of internal revenue harried the administration. At first Truman brushed off the revelations as a "big lie and smear," and refused to accept proposals for reforms and personnel changes. He declared that "all my men are honest." As the year ended, however, he was engaged in "house-cleaning." He had allowed William M. Boyle, Jr., chairman of the Democratic national committee, an old friend accused of profiting from exerting pressure on RFC members, to resign. He approved the dismissal of more than 60 internal revenue officials, and requested and received the resignation of T. Lamar Caudle, head of the tax division of the department of justice.

Reversing his earlier position, he asked congress to place internal revenue officials under civil service. He proposed a law under which both elected and appointed federal officials, together with members of congress and top party officers, should register the sources of income, gifts and loans, if they earned more than $10,000 annually.

Important changes in appointive offices occurred during 1951. When Gen. George C. Marshall resigned as secretary of defense, his place was taken by Robert A. Lovett, a New York banker and former deputy secretary of defense. Thomas B. McCabe, a Pennsylvania Republican, was succeeded as member and chairman of the board of governors of the federal reserve system by William McC. Martin, Jr., of St. Louis, Mo. President Truman provoked protests from Protestant churchmen when he appointed Gen. Mark W. Clark as ambassador to the Vatican, and the senate recessed without acting on the nomination.

President Truman had numerous clashes with the press, in which he accused reporters at Washington and in Korea of "misrepresenting" the facts. As a result, he issued a security order restricting release of public information of a nonmilitary nature. It was criticized by some newspapermen as censorship.

On running again in 1952, the president remained secretive. He said that he had made up his mind about 1952 plans, but that he was not telling anybody. He did note, however, that the 22nd amendment barring a third term did not apply to him. In his most political speech of the year, he predicted that, although the Democrats would face a campaign of "the big lie" and "slush funds" in 1952, they would win. (*See* also DEMOCRATIC PARTY; ELECTIONS, U.S.; REPUBLICAN PARTY; UNITED STATES.)
(R. TU.)

Trust Territories. These include former German colonies and islands which became mandates after World War I and trust territories after World War II; South-West Africa, which remained mandated; and former Italian Somaliland which became a trust territory with Italy administering on April 1, 1950. Total area: 1,231,948 sq.mi.; total population *c.* 19,389,000.

History.—For the first time, the United Nations Trusteeship council had to handle reports from all the 11 trust territories in 1951. Partly because of its own experience and partly as a result of suggestions made by the general assembly, the council adopted a procedure by which it examined the Pacific reports at its winter sessions (January–March) and the African reports at its summer sessions (June–July) and by which it could at the same time consider petitions dealing with the territories and any current report by a visiting mission. Thus, once every year, the council would be able to fulfil its supervisory role by a comprehensive study of the political, economic, social and educational advancement of the inhabitants of all trust territories.

The soviet representative returned to the council. But little

Trust and Mandated Territories

Territory	Area (in sq. mi.)	Population		Administering Authority
South-West Africa*	317,725	(1951 cen.)	430,354	Union of South Africa

change was observable in the soviet attitude of obstructive criticism, and of propaganda generalizations from a few handpicked items in reports, and in the demand for the abolition of tribal systems so that a transition could immediately be made to self-governing democratic principles. Nevertheless, the steady constructive progress of the council's work was beyond doubt. Increasing familiarity with on-the-spot problems of administration enabled it, more and more, to obtain a balanced view of conditions and to strike a happy medium between the desire, on principle, to see the advance toward autonomy or self-government made as rapidly as possible and a fair appreciation of the actual achievements by the administrating authorities to date. This constructive approach was marked in all the council's important tasks, and its continuation, as the president, Sir Alan Burns, pointed out, meant great promise for the future of the trusteeship system and of unbounded usefulness to the administrating authorities in protecting and advancing the real interests of the peoples in their charge.

In reviewing the annual reports the council recognized advance—more rapid in some territories than others, but common to all—in political development, economic improvement, betterment of social conditions and the spread of education. It freely commended specific achievements, such as the advancement in political responsibility of the indigenous population in Western Samoa, the economic improvement in British Cameroons and the spread of education in Belgian Ruanda-Urundi and, in spite of all difficulties, in the U.S. Pacific islands. It made many constructive suggestions proposing, for example, a loan from the International Bank for Reconstruction and Development to Italian Somaliland, the training of more teachers and the adjusting of administrative systems to enable indigenous peoples to pass more rapidly from junior to senior civil service posts. It also made recommendations for action by the administrating authorities on more than 250 petitions. The machinery for visiting missions was overhauled in the light of experience, and provision was made for the issue of a standard statement on the purposes, principles and structure of the United Nations to reach the widest possible area. In the summer a second visiting mission set out for East Africa to include Italian Somaliland, as well as Belgian Ruanda-Urundi and British Tanganyika.

The ninth session of the council was faced once more with the Ewe problem, arising from certain demands for both the unification of the Ewe peoples, who inhabit parts of British and French Togoland and of the Gold Coast, and the unification of the two Togolands. The two governments concerned, after taking a series of measures designed to remove difficulties between the Togolands and to find out the wishes and interests of all the peoples concerned, became convinced that no solution altering the boundaries or political allegiance could at present command general assent. As a practical solution, a joint council of representatives of the two Togolands was to be set up, associating the peoples more directly with all efforts to harmonize the policy of development in both Togolands as steps to self-government. The council concurred with this step and urged that all elements of the population of the two trust territories co-operate in the establishment of this joint council.

Complex trusteeship problems were also kept under almost continuous review. Throughout the year a special committee on rural economic development, set up in response to an assembly recommendation, made real progress in the first phase of documentation; the next stage involved the examination of land policies. Tuberculosis.

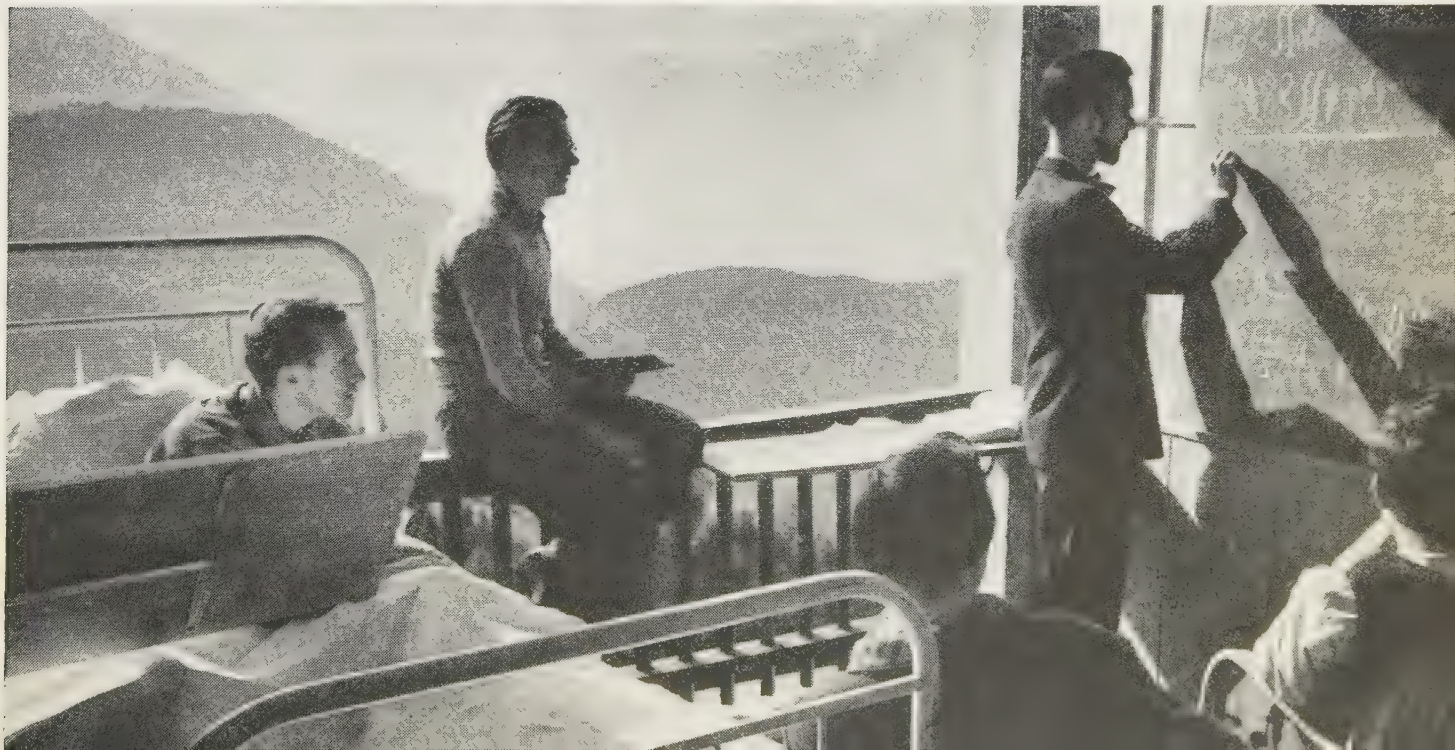
During 1951 L. R. L. de Gouvea and associates, Brazil, reported 62 cases of tuberculosis complicated by pregnancy and emphasized the importance of postdelivery care of mother and child. B. Ratner, New York city, observed 260 infants of tuberculous mothers but saw no case of congenital tuberculosis. He found that when infants are removed from tuberculous mothers at birth and continue to remain in an environment free from tuberculosis, no tuberculosis develops among them. F. E. Amick, Washington, D.C., reported four cases of congenital tuberculosis. He stated that only 124 such cases had been described in the world's literature.

Treatment.—Streptomycin and para-aminosalicylic acid in combination was the most useful drug treatment. Viomycin, a new antibiotic, was studied experimentally by a number of work-



TUBERCULAR STUDENTS attending a lecture in advanced mathematics at the Sanatorium Universitaire in the Swiss Alps in 1951; patients could receive treatment without having to discontinue their studies ers, including A. C. Finlay, New York, who reported it to be an effective agent against tubercle bacilli in culture and in experimental animals. F. H. Belgorod, New York, found tibione (amithiozone) beneficial when used alone or in combination with streptomycin and para-aminosalicylic acid. A. G. Karlson, Rochester, Minn., found that in tuberculous animals cortisone prevented the restriction and healing of tuberculosis while streptomycin was being administered.

Excisional surgery was extensively employed. This consists of removing a diseased lung, a lobe, a segment or even a smaller part. The immediate results were usually satisfactory, but a true evaluation awaited much longer observation. Such excisional surgery partially replaced thoracoplasty. A. Lanari, Buenos Aires, Arg., removed a lobe from lungs of dogs and inserted another. Survival up to 25 days caused him to conclude that the insertion of a lobe of a lung is a possibility.

As of Jan. 1, 1951, there were 108,844 beds for tuberculous patients in the United States. This was an increase of 800 over 1950.

The United States Veterans administration operated approximately 14,800 beds, which were distributed in tuberculosis hospitals, general medical and surgical hospitals, and neuropsychiatric institutions. As of Dec. 31, 1950, the central tuberculosis case register of the Veterans administration contained 46,414 veterans.

M. D. Kogel, commissioner of hospitals of New York, emphasized that tuberculosis was the most significant single disease problem with which his department had to cope. In the first six months of 1951 the average daily tuberculosis census was 5,090, with a long waiting list for admission to the departmental tuberculosis hospital. Among the 19,170 people known to have tuberculosis in New York on June 30, 1951, 53%, one-third of whom were contagious, were without hospital care. The parliamentary secretary to the British ministry of health said that the waiting list for sanatorium beds in England and Wales was 10,400 on Dec. 31, 1950.

Transmission from Animals.—A. G. Karlson called special attention to the transmission of tuberculosis from animals to people and from people to animals. This emphasized the futility of attempting to control the disease in people without eradicating it from animals, and vice versa. Karlson said: "An animal that reacts positively to the tuberculin test is properly considered as a dangerous individual. . . . In spite of the great advances in control, there is a constant potential hazard as long as only a few infected animals exist." W. K. Hannover stated that in Germany 63% of all cow herds and 31% of all cows must be considered infected with tubercle bacilli. Veterinarians of the World Health organization pointed out that in central and southern Europe the level of tuberculous infection in cattle may reach 60%, while in some countries the disease had been virtually eradicated through tuberculin testing and removal of infected animals from herds. E. Hedvall stated that 72% of the area of Sweden was free from tuberculosis among cattle, and in the county of Uppsala approximately 95%. With the control of tuberculosis among cattle in Sweden since 1941, there had been a sharp decrease in tuberculosis in people. E. G. Sita, Lumsden, Eng., said that only 0.02% of Danish cattle reacted to tuberculin. A. K. Kuttler, Washington, D.C., reported that testing of 8,847,228 cattle in the United States in 1951 resulted in 0.14% reactors to tuberculin. Of the 12,422 reactors slaughtered, the carcasses of only 87 (0.7%) were unfit for food.

Immunization.—R. J. Dubos, New York, studied specimens of BCG (Bacillus-Calmette Guérin), which was being dispensed from various laboratories in Europe and America, and found that they differed in many of their properties. This was particularly true of degree of virulence. Moreover, each specimen, instead of containing a single bacterial form, was found to be composed of mixtures of different bacterial forms which differed in their properties, particularly in their extent of multiplication in experimental animals.

Contrary to former belief, BCG is carried from the site of administration to internal organs and lymph nodes in a short time. C. Gernez-Rieux, France, administered BCG to guinea pigs by the scarification method. Organisms were regularly recovered from the skin lesions on the 41st day, and occasionally on the 79th day. Regional lymph nodes revealed bacilli on the 175th day. BCG were found in the spleen on the 11th day, showing that even by the scarification method the organisms promptly reach the internal organs. L. Ström, Sweden, found that, when administered intracutaneously, some bacilli reached the nearest lymph node 18 cm. distant in 3 minutes, and about half had arrived at this point in 10 minutes. A considerable number of persons developed significant tuberculous lesions after having received BCG. Z. Hlouskova, Czechoslovakia, reported 64 cases of lymphadenitis, seven erythema nodosum, three phlyctenular conjunctivitis, three with tuberculous changes in lungs and nine with tuberculous meningitis. Hedvall recorded 12 persons in whom tuberculosis was later demonstrated. J. Meunier reported 14 adolescents who by accident received 750 times the usual dose of BCG. All developed local ulcerations.

P. Hauduroy injected BCG into 29 normal hamsters. All died from tuberculosis within 12 months.

M I. Levine, New York, made a follow-up study of 1,165 adolescents, of whom 601 had received BCG in infancy. He found no evidence that this procedure is capable of preventing reinfection tuberculosis in adolescence. E. R. Levine, Chicago, strenuously opposed the use of any vaccine such as BCG among school children, since, he said, the hope of eliminating tuberculosis by vaccination is a vain one. The Council on Pharmacy and Chemistry of the American Medical association reported on the status of BCG and stated that the general use of BCG vaccine for all infants, children and tuberculin-negative persons in the U.S. did not appear to be warranted and should not be encouraged. D. T. Smith, president of the National Tuberculosis association, said, "Tuberculosis cannot be eliminated from the United States by BCG vaccination regardless of how efficiently it is applied. The only sure way to eliminate the disease is to practice what we have been preaching for the last 50 years. Every individual with active tuberculosis must be detected and isolated and treated until he is no longer infected."

Because of the possible dangers of introducing living tubercle bacilli into humans, the use of dead bacilli was further recommended. In Italy, Petragnani-Salvioli vaccine consisting of bacilli killed by formalin was used in some places. A. Milzer, Chicago, reported that ultra-violet-killed tubercle bacilli vaccine is superior to BCG vaccine as a prophylactic agent.

Mortality.—In many countries, including those engaged in World War II, the tuberculosis mortality rate had decreased remarkably. The United States had the lowest rate (22.2 per 100,000 in 1950) of any major nation, and it was estimated that it was less than 20 per 100,000 in 1951. In ten states the rate was less than 12. The lowest was 3.8 in Wyoming.

The use of new drugs to suppress the disease and chest surgery may be partially responsible for decreased mortality in many countries. It did not appear that immunization procedures played a significant role, inasmuch as mortality rates decreased as much, and in some instances more, in countries where they were not employed. Tunisia.

A French protectorate in North Africa, Tunisia is situated between Algeria (west) and Tripolitania (east). Area: 48,332 sq.mi. Pop.: (1946 census) 3,230,952; (1950 est.) 3,475,000. Arabs and Berbers constitute 87.6% of the population; they are Moslem and speak Arabic. In 1946 there were 239,249 Europeans, including 143,977 French citizens (many of them Italian-born) and 84,935 Italians. There were also 71,543 Jews. Chief towns (1946 census): Tunis (cap., 364,593, including 119,222 Europeans); Sfax (54,637); Bizerta (39,327); Sousse (36,566). Ruler: Bey Sidi Mohammed el-Amin; prime minister: Mohammed Shenik; French resident general: Louis Périllier.

History.—Structural changes in the protectorate had begun when the Shenik ministry, including Neo-Destour representatives, was formed in 1950; they were continued, in agreement with the French government, in 1951. On Feb. 8 a corpus of reforms was promulgated: the council of ministers was henceforth to be under the chairmanship of the prime minister instead of that of the resident general; the certificate of the secretary general would no longer be necessary for ministerial decisions; and a proportion of the administrative offices, varying from three-quarters to one-third according to classification, would be reserved for Tunisians.

In May there were clashes between students of the Zitouna mosque-university who supported the ultranationalist Old-Destour movement, and Neo-Destour elements. The bey made a speech expressing the hope that he would be able to give his people a constitution soon. The resident general, Louis Périllier, advised ministers that an atmosphere of trust was required before progress could be made and that municipal reform was the first concern.

French settlers made known their fear that Tunisian emancipation would end in the eviction of the French. On the other hand, the Neo-Destour leader Habib Bourguiba tried to stir world opinion and sharply criticized the slowness of French policy in various articles and speeches at Karachi, New York city and London. In Paris, in October and November, Shenik and three of his ministers began conversations with a view to further reforms. In December the French government proposed that a mixed commission should be set up in 1952 to study reforms. Political parties and trade unions protested against the delay and against Tunisian Frenchmen's taking part in the country's government.

Rehabilitation of roads, railways and harbours was nearly completed. Land bought back from Italians was distributed to war veterans. Boring for petroleum was continued south of Bizerta, at Cape Bon and in the region of Gabes.

Education.—Schools, primary and secondary, pupils (1950): Moslem 113,300, French 37,600, Jewish 14,400, other 9,980.

Finance.—Budget (1950 est.): balanced at 33,640,000,000 fr. Monetary unit: Tunisian franc = metropolitan franc. In 1951 the exchange rate was 350 fr. = U.S. $1.

Foreign Trade.—(1950) Imports 51,210,000,000 fr. (including 40,000,000,000 fr. from France); exports 37,529,000,000 fr. (including 16,380,000,000 fr. to France).

Transport and Communications.—(1950) Railways 2,174 km.; roads 14,000 km.; motor vehicles 21,500. Ships entered (all ports): 2,928. Aircraft landed: 5,325.

Industry.—Mineral production (1950, metric tons): phosphate rock 1,530,000; iron ore 757,000; lead ore 30,000. (Hu. De.)

Tunnels.

Hydroelectric power developments were the primary force behind world tunneling in 1951, with water supply and vehicular projects in secondary positions.

North America.—Acting quickly on a U.S.-Canadian treaty of 1950 making more Niagara river water available for power, Ontario started a tunnel under Niagara Falls, Ont. To carry water to a new power plant in the Niagara gorge, the tunnel was to be 5 mi. long and 40 ft. in finished diameter. These dimensions would make it one of the largest tunnels yet built. United States plans for Niagara water use were tied up in a public *v.* private power disagreement over sponsorship.

Also started in the continent's northern reaches was a 4.4-mi. diversion tunnel for the Eklutna hydroelectric project in Alaska.

At two big hydro and flood control dams on the Missouri river, 20 short large-bore power-water and discharge tunnels were completed: at Ft. Randall dam, S.D., there were 12; at Garrison dam in North Dakota there were 8.

For the Colorado-Big Thompson power and irrigation project, Bald mountain tunnel, 1.3 mi., was begun and holed through. Eight other tunnels were holed through. These included the 5.6-mi. Pole hill tunnel, which was bored in 75% of the allotted time. Another U.S. bureau of reclamation project, the 5.9-mi. Duchesne tunnel in Utah's Provo river project, continued, its driving aided by roof bolting. This technique, previously used in underground mining, involves driving long bolts into the surrounding rock. The bolts have large washers or perforated steel plates at the rock face and hold unstable rock in place much less expensively than do arch ribs and lagging. Driving proceeded on the 6.4-mi. Tecolote water tunnel in California. The longest (6 mi.) of Los Angeles' three Owens valley power-project tunnels was holed through, and work was finished on the other two. Total project length was 9½ mi. In Washington, work began on the Columbia basin project's 1.8-mi. West canal-Frenchman hill tunnel.

Still the most important water-supply tunnels in 1951 were the Neversink and East Delaware tunnels of New York city's Delaware river water-supply project. The former, 6 mi. long, was being lined during the year. Driving progressed on the latter, 25 mi. long, from two portals and two shafts. Work was substantially completed on the Baltimore, Md., 10-mi. Liberty road-Patapsco tunnel. In Mexico the Lerma water-supply system for Mexico City was put into use. The project included a 9-mi. tunnel.

Chicago's south side interceptor sewer tunnel, 13.4 mi., was completed and placed in operation.

Sunken-tube tunnels were important in the vehicular category. One, under the Elizabeth river at Norfolk, Va., was 80% complete at the year's end. On another, at Baytown, Tex., all tubes were in place but approaches were not fully under contract. In San Francisco, Calif., the Broadway vehicular tunnels neared completion. Railroad tunnels included that of the Baltimore and Ohio railroad near Clarksburg, W.Va., where old mine workings made driving difficult. Work was 70% complete at the end of 1951. On another railroad tunnel, a 7,000-ft. one at a copper mine in Utah, 805 ft. was driven in 27 days—an unusual rate for standard railroad-size bore.

South America.—The longest tunnel in South America was Peru's 8-mi. Moyopampa tunnel, completed in 1951. It was driven for an addition to the Lima hydroelectric system. In Venezuela, three highway tunnels between Caracas and the port of La Guaira were under way. The first, 1,445 ft., 4-lane, was holed through in 1951. In Rio de Janeiro, Brazil, a ¾-mi. vehicular tunnel between the Laranjeiras and Catumbi sections of the city was under way.

Europe.—In England work continued on four main tunnels of the Manchester water-supply project, the 10.2-mi. Bowland forest tunnel being completed in November. Haslingden and Walmersly tunnels, 11.3 mi. total, were driven half way and the 2.3-mi. Mare hill tunnel was started.

In Switzerland the Maggai valley hydroelectric project, requiring 45 mi. of tunnels, continued. Palagnedra tunnel—the project's southern portion—was completed in 1951. About 14 mi. of the remaining 22 mi. had been driven. Work, begun more than 20 years before, was resumed on Spain's Viella tunnel, last link for the Pyrenees highway from Port Bou on the Mediterranean to Fuenterrabia on the Atlantic.

Scandinavian tunnels were principally for power. In 1951 Norway had 15 tunnels totalling 250 mi. under construction. Both public and private power interests in Sweden had 13 hydroelectric tunnels totalling 18 mi. in length under way in 1951. The longest was at Tasan project, including a 4.2-mi. headrace tunnel and a 2.9-mi. discharge section.

Other Countries.—In Algeria a 6-mi. hydroelectric tunnel to serve an underground power plant on the Oued river neared completion. The Hex river tunnel (railroad) work in the Union of South Africa was suspended. (R. H. Ds.)

Turbojets and Turboprops: *see* AVIATION, CIVIL; JET PROPULSION.

Turkey. A republic in the southeastern Balkans and Asia Minor, Turkey is bounded west by the Aegean sea, northwest by Greece and Bulgaria, north by the Black sea, northeast by the U.S.S.R., east by Iran and south by Iraq, Syria and the Mediterranean. Area: 296,185 sq.mi. (including 9,256 sq.mi. in Europe). Pop.: (1945 census) 18,790,174; (1950 census) 20,934,670. According to the 1945 census, European Turkey had 1,496,612 inhabitants (165 per square mile) and Anatolia 17,293,563 (59 per square mile). Foreign-born Turkish citizens (1935 census): 962,159, including 367,801 in Greece, 227,464 in Bulgaria, 158,145 in Yugoslavia, 69,798 in the U.S.S.R. and 61,649 in Rumania. Language (1935 census): Turkish 86.8%, Kurdish 9.3%, Arabic 0.9%, Greek 0.7%, Circassian 0.6%, Armenian 0.4%, Georgian 0.5%, other 8%. Religion: Moslem 97.7%. Other religions (1935 census): Christian 226,167 (Greek Orthodox 125,046, Gregorian Armenian 44,526, Roman Catholic 32,155, Catholic Armenian 11,229, Protestant 8,486, other Christian 4,725); Jewish 78,730. Chief towns (1950 census): Ankara (cap., 286,781); Istanbul (1,018,468); Izmir (362,340); Adana (117,799); Bursa (100,007); Eskişehir (88,459). President of the republic, 1951: Celâl Bayar; prime minister, Adnan Menderes.

History.—The year saw the consolidation of the Democratic regime in Turkey, confidence in the government being clearly expressed in 17 by-elections held in September, in which the Democratic candidates were returned with large majorities. There were some changes in the cabinet, but no modification of policy. On March 29 a vote of confidence in the government was passed by 244 votes against 61.

Attempts to start a Communist movement were revealed. Nazim Hikmet, known as a left-wing poet and released from prison under the previous year's amnesty, fled to Moscow, whence he was sent to preach Stalinism among the Turks in Bulgaria. A considerable number of arrests were made.

The program of legislation in 1951 included a bill giving the right to strike, subject to clear safeguards. Another provided for the introduction of holidays with pay. It was estimated that this would cost the government £T1,676,000 a year and quasi-government interests £T20,000,000.

Foreign Relations.—The logical outcome of Turkey's adherence to the ideals of the western democracies was its invitation, at the Ottawa Session of the NATO council (Sept. 15–20), to join the North Atlantic Treaty organization. It led to a note of protest from Moscow (Nov. 3) which was accepted philosophically by the Turks who, in their reply ten days later stressed the purely defensive aims of the treaty, pointing out how it contrasted favourably with the military preparations of the Soviet Union which were themselves the cause of the North Atlantic treaty. On Oct. 12–15 Gen. Omar N. Bradley, chairman of the U.S. joint chiefs of staff, Field Marshal Sir William Slim, chief of the British imperial general staff, and Gen. Charles-François Lechères, chief of the French general staff, met in Ankara to discuss matters with the Turkish military authorities.

In opening the national assembly on Nov. 1 President Bayar stated that the Turkish government had decided to take common measures with the other powers concerned to organize the defense of the middle east. It was a logical sequence that Turkey was invited to send observers to the NATO council in Rome at the close of November.

With other Moslem countries Turkey remained on excellent terms in 1951. With Pakistan a pact of friendship was concluded. With Iraq and Iran relations were friendly, and with Afghanistan bonds were strengthened by the visit to Turkey of Shah Mahmud Khan, prime minister of that country. With Bulgaria, however, relations were strained. On Nov. 8 the frontier was closed when it was discovered that 126 of the immigrants being admitted into Turkey were bearers of forged visas.

(MA. B.)

Education.—Schools (1949–50): primary 17,029, teachers 34,036, pupils 1,625,499; secondary 383, teachers 4,063, pupils 69,226; lycées 88, teachers 1,837, pupils 21,945; farming and handicraft 21, teachers 667, pupils 12,439; professional 289, teachers 4,102, pupils 44,223; institutions of higher education 34 (including the universities of Istanbul and Ankara which had 874 teachers and 20,182 students in 1948–49), teaching staff 1,567, students 26,625. Illiteracy (1945): male 49.2%; female 77.5%.

Finance and Banking.—Budget: (1950 actual) revenue £T1,313,300,000, expenditure £T1,487,200,000; (1951 est.) revenue £T1,345,000,000, expenditure £T1,579,700,000. Currency circulation (Sept. 1951) £T1,158,000,000. Bank deposits (Dec. 1950) £T1,122,000,000. Gold and foreign exchange (Sept. 1951) U.S. $190,000,000. Monetary unit: Turkish pound or lira with an exchange rate of £T7.84 to the pound sterling and £T2.80 to the U.S. dollar.

Foreign Trade.—(1950): Imports £T800,400,000; exports £T738,000,000. Main sources of imports (1950): U.S. 24.5%; Germany 17.6%; U.K. 10.5%; France 5.0%. Main destinations of exports: Germany 21.2%; U.S. 16.9%; U.K. 14.0%; Italy 5.5%. Main imports: machines 23.1%; iron and steel 12.2%; petroleum products 7.3%; cereals and vegetables 7.2%. Main exports: cotton 26.5%; tobacco 23.2%; raisins 8.2%; hazelnuts, shelled 6.9%.

Transport and Communications.—Roads (1949): 13,530 mi., including 7,900 mi. all-weather roads. Licensed motor vehicles (Dec. 1950): cars 10,071; commercial 16,386. Railways (1949): 4,882 mi.; passenger-miles (1950) 1,350,000,000; freight net ton-miles (1950) 1,573,000,000; freight carried (1950) 7,332,000 metric tons. Shipping (merchant vessels of 100 gross tons and over, July 1950): 217; total tonnage 387,830. Air transport (Turkish state airways, 1947): flights 6,712; miles flown 1,188,109; passengers flown 78,844. Telephones (1949): subscribers 52,423. Radio receiving sets (1949): 250,000.

Agriculture.—Main crops (metric tons, 1950): wheat 3,872,000; barley 2,047,000; oats 316,000; maize 628,000; rye 443,000; potatoes 605,000; sugar, raw value 140,000; tobacco 85,000; cotton, ginned 146,000; grapes (1949) 1,681,000; olives (1949) 239,000; olive oil 45,000; linseed 28,000; cottonseed 192,000; sunflower seed 90,000; sesame seed 29,900; soya beans 2,000; dry beans 87,000; hemp fibre 7,700; oranges and tangerines 51,000. Wine production (1949): 170,000 hl. Livestock: cattle and buffaloes (Dec. 1950) 11,134,000; sheep (Dec. 1950) 22,128,000; horses (Dec. 1950) 1,140,000; camels (Dec. 1949) 105,000; mules (Dec. 1949) 103,000; asses (Dec. 1948) 1,711,000; goats (Dec. 1949) 17,323,000; turkeys (Dec. 1948) 1,145,000; chickens (Dec. 1950) 20,114,000. Wool, greasy basis, (1951) 34,000 metric tons. Meat (1949): total 80,000 metric tons, of which beef and veal 34,000.

Industry.—Fuel and power (1950): coal 4,356,000 metric tons; lignite 1,204,000 metric tons; crude oil 17,000 metric tons; electricity 790,000,000 kw.hr. Raw materials (metric tons, 1950): iron ore, metal content 221,000; pig iron 110,000; steel ingots and castings 91,200; copper smelter 11,800; chrome 400,000; manganese ore 23,200; antimony ore, metal content 454,000; salt (1948) 263,000; sulphur (1949) 3,100; boracite (1949) 7,100. Lumber, sawn wood, (1949 est.): softwood 308,000 cu.m., hardwood 154,000 cu.m. Manufactured goods (metric tons, 1950): cement 396,000; cotton yarn 30,200; wool yarn 7,440; paper and cardboard (1949) 19,200.

Union of Soviet Socialist Republics.

The federation of soviet socialist republics is a Eurasian state covering parts of eastern Europe and northern and central Asia. Area: (before Sept. 17, 1939) 8,173,557 sq.mi.; (after Sept. 2, 1945) 8,598,678 sq.mi., including 1,969,110 sq.mi. (23%) in Europe. Pop.: (1939 census) 170,467,186; (1940 est.) 192,357,000; (1950 est.) 201,300,000, including about 138,000,000 (68.6%) in Europe. The U.S.S.R. occupies 14.8% of the world's total land area and is the world's largest state; with a population representing 8.3% of the world total it is, after China and India, the third most populated country. (*See* Table I.)

In 1939 the union consisted of 11 republics of which the Russian Soviet Federated Socialist republic was by far the largest, occupying 78% of the whole territory. The Ukrainian Soviet Socialist republic, second largest, covered only 2.1% of the total area. The U.S.S.R. is inhabited by more than 110 nationalities speaking different languages. In 1939 Russians constituted 58.2% of the population, Ukrainians 16.5%, Byelorussians 3.1%, Poles 0.5%, Bulgars 0.07% and Czechoslovaks 0.02%. None of the other nationalities, all non-Slavonic and most of them non-European, reached 3% of the total. The most important were the Turkish-speaking Uzbeks 2.85%, Tatars 2.5%, Kazakhs 1.82%, Azerbaijanis 1.34%, Turkmens 0.45% and Kighiz 0.45%; there were also Jews 1.78%, Georgians 1.32% and Armenians 1.27%.

Chief towns (pop., 1939 census): Moscow (cap., 4,137,016; 1950 est., 7,000,000); Leningrad (3,191,304); Kiev (846,293); Kharkov (833,432); Baku (809,347); Gorki (644,116); Odessa (604,223); Tashkent (585,005); Tiflis (519,175); Rostov-on-Don (510,253); Dnepropetrovsk (500,662). Eight towns had a population of more than 300,000, 20 had more than 200,000 and 43 had more than 100,000.

Chairman of the presidium of the supreme soviet of the U.S.S.R., Nikolai Mikhailovich Shvernik; chairman of the council of ministers, Joseph Vissarionovich Stalin (*q.v.*).

History.—In Europe, unremitting pressure was continued in 1951 to achieve German unity under a people's democracy; in the middle east support was given to nationalisms as the most expedient short-term policy; in the far east a new program for the national liberation of Japan under the aegis of its Communist party was made public. As well as inspiring a general international unrest, the soviet leaders gave encouragement to vicarious local aggressions in Korea, Indochina and Malaya.

A message from Pres. Harry S. Truman to N. M. Shvernik, chairman of the presidium of the supreme soviet, on July 6, transmitted a U.S. congressional resolution expressing regrets at the "artificial barriers" that separated the U.S. and soviet peoples and assuring the latter that the U.S. people had no desire for war against the Soviet Union. In his letter of reply to President Truman on Aug. 6, Shvernik sought to distinguish between the U.S. people, about whom the Kremlin had no

Table I.—*Union of Soviet Socialist Republics*

Republic	Capital	Area (sq. mi.)	Population (1940 est.)
Russian S.F.S.R.	Moscow	6,533,584	108,800,000*
Ukraine	Kiiv (Kiev)	222,625	40,525,000†
Byelorussia	Minsk	80,154	9,000,000
Uzbekistan	Tashkent	157,336	6,282,400
Kazakstan	Alma-Ata	1,063,242	6,146,000
Georgia	Tbilisi (Tiflis)	29,421	3,542,300
Azerbaijan	Baku	33,089	3,209,700
Lithuania	Vilnius (Wilno)	25,174	3,000,000‡
Moldavia	Chisinau (Kishynev)	13,050	2,700,000§
Latvia	Riga	24,903	1,950,000
Kirghizia	Frunze	76,023	1,459,300
Tadzhikistan	Stalinabad (Dyushambe)	55,058	1,485,100
Armenia	Erivan	11,506	1,281,600
Turkmenistan	Ashkhabad	187,181	1,252,000
Estonia	Tallinn (Reval)	17,413‖	1,117,300
Karelo-Finnish S.S.R.	Petrozavodsk	68,919	606,300§
		8,598,678	192,357,000

*According to the 1939 census the population of the Russian S.F.S.R. was 109,278,614. Its reduction was explained by the fact that the Karelian A.S.S.R. (469,145 inhabitants in 1939) formed with the areas ceded by Finland in 1940 a Karelo-Finnish S.S.R.

†Excluding the population of Subcarpathian Ruthenia (725,000), which was incorporated into the Ukrainian S.S.R. in 1945.

‡Excluding the population of the Klaipeda (Memel) territory which was incorporated with the Lithuanian S.S.R. in 1945.

§1941 official soviet estimate.

‖Official Estonian sources before 1940 gave the area of Estonia as 18,358 sq. mi.

Source: Areas and populations are taken from the *Bolshaya Sovietskaya Entsiklopedia: Soyuz Sovietskikh Sotsialisticheskikh Respublik* (Moscow, 1948). While all the areas are postwar, that is, including territorial aggrandizements in the west and east, population figures are in general those of the 1939 census, except for republics which were either increased by the 1939-45 annexations or formed after 1940. The order, as in the original, is according to the number of population.

MAP PURPORTING to show the location of soviet forced labour camps which was handed to Andrei Gromyko by Representative O. K. Armstrong of Missouri during a session of the Japanese peace treaty conference in San Francisco, Calif., Sept. 6, 1951. Gromyko discarded the map without examining it

"KIBITZER'S DELIGHT," a 1951 cartoon by Fischetti of NEA Service, Inc.

grounds for doubting that they did not want war, and certain forces who strove to unleash a new world war. He forwarded a long resolution of the presidium of the supreme soviet in which the responsibility for "artificial barriers" was laid at the door of the U.S. government. As a positive contribution to improvement of international relations, he proposed a peace pact between the United States, the U.S.S.R., Great Britain, France and Communist China, the limitation of armaments and the outlawing of atomic weapons.

On a complaint by Herbert Morrison, British foreign secretary, that declarations of British government spokesmen were not properly reported in the soviet press, *Pravda* offered to publish a statement by Morrison, and on Aug. 1 gave space both to an article signed by the British foreign secretary and a reply. Whereas Morrison expressed his sincere wish for co-operation between Great Britain and the U.S.S.R. in advancing peace and progress in the world, *Pravda* concluded that the soviet peoples were right in regarding present-day Anglo-American politicians as instigators of a new world war. Such a conclusion was consistent with the exchange of notes which took place between the British and soviet governments early in the year. On Jan. 20 the soviet government had accused Great Britain of having violated its obligations under the Anglo-Soviet treaty of May 26, 1942. On Feb. 17 the British government refuted this accusation.

Similar notes addressed by the soviet government to France on Jan. 20 and Sept. 11 accused the French government of fostering the restoration of a regular German army for purposes of aggression and undermining the basis and significance of the Franco-Soviet treaty of Dec. 10, 1944. France replied on Sept. 26 refuting soviet accusations and reaffirming "its determination to oppose any utilization of Germany as a base for aggression."

*Years of appointment in parentheses.

†Also chairman of the Agitprop (Board for Propaganda and Agitation) and director of the foreign secretariat providing a link with foreign Communist parties and supervising the activities of the Cominform.

‡Molotov was chairman of the Council of People's Commissars from 1930 to 1941.

§Also chairman of the V.Ts.S.P.S. (Vsesoyuzny Tsentralny Soviet Professionalnykh Soyuzov or All-Union Central Council of Trade Unions).

‖Also secretary general of the V.L.K.S.M. (Vsesoyuzny Leninsky Kommunistichesky Soyuz Molodezhi or All-Union Lenin League of Communist Youth).

¶Also chairman of the Party Control commission, with Shkiryatov as deputy chairman.

The Politburo-controlled World Peace council continued the propaganda activity initiated at the beginning of 1949. The council, reassembled in Berlin in Feb. 1951, appealed for a five-power pact and warned that refusal to join would be considered proof of aggressive intentions. By this means the Communist organizers sought to condemn in advance all who opposed Moscow's policies. According to *Izvestia,* the number of signatures to the Berlin appeal amounted by Nov. 15 to 562,083,383, including 117,669,320 signatures from the U.S.S.R. and from China 344,053,057.

In November A. Y. Vishinsky again submitted the peace proposals, at the U.N. general assembly in Paris. Western statesmen replied in effect that the creation of an undemocratic directorate of great powers made sense only as an attempt to by-pass the United Nations; the reduction of armaments alone was not enough to achieve real peace and no reduction was possible without revealing the existing levels of the armed forces of all major powers; to outlaw atomic weapons alone would be illusory, and, finally, that an effective system of international control was needed.

The Party and the Government.—During 1951 congresses were held by the Communist parties of the soviet republics of Armenia, Azerbaijan, Estonia, Kazakstan and Moldavia. As party congresses had already taken place in 10 other republics during 1949 and 1950, it was to be assumed that the preparatory work for the long-overdue 19th congress of the All-Union Communist party (of the Bolsheviks), required by statute to meet triennially, which it had not done since 1939, was nearing its end. No congress would be held in the Russian S.F.S.R. for there were no purely Russian central party organs.

Access to party membership having been somewhat eased during World War II, the All-Union Communist party had increased its following from 3,400,000 in 1940 to more than 6,300,000 in 1947. Since many who joined out of expedience were evidently not trusted, a general purge of party membership was started throughout the Soviet Union in 1948 and by 1951 had been almost completed. Although the combined party membership of the 15 republics outside of the Russian S.F.S.R. was no more than one-fifth of the total, compared with almost one-half of their combined population, the purge was particularly severe in those republics, where "nationalist deviation" was repeatedly rife.

Between congresses the central committee directs the party through three key bodies, the secretariat, the organizing bureau (Orgburo) and the political bureau (Politburo). By 1951 at least 24 out of 71 full members and 68 deputy members of the central committee elected by the 18th congress were dead and 34 had disappeared; study of the soviet press disclosed that 16 new members of the central committee had been co-opted since 1945. (*See* Table II.)

Of the deputy premiers, each responsible for a ministry or a group of ministries, nine were members of the Politburo. V. M. Molotov was undoubtedly the superior of A. Y. Vishinsky; N. A. Bulganin was in control of the war, navy and armaments ministries as well as of a special office of satellite armies. Chief of the ministries of internal affairs, state security and state control was L. P. Beria. Although G. M. Malenkov had no ministerial responsibility, he was the only man other than Stalin who was simultaneously deputy premier and a member of the three key party bodies. A. A. Andreyev continued to look after agriculture. A. I. Mikoyan controlled foreign trade and was believed to have charge of the Council for Mutual Economic Aid. Marshal Klementy Voroshilov succeeded Andrei A. Zhdanov as chief of cultural activities and the supervision of various technical ministries was divided among the remaining deputy premiers.

The Federal Republics.—During the year the citizens of the Soviet Union were called to the polls on Feb. 18 and 25, when elections took place of deputies to the supreme soviets of the 16 federal republics, and on Dec. 16 and 23, when members of republican, provincial and district tribunals were elected. At the so-called republican legislative elections the Russian S.F.S.R. elected 763 deputies (1 per 150,000 inhabitants), while in other republics the number of deputies varied from 120 (Karelo-Finnish S.S.R., 1 deputy per 5,000) to 412 (Uzbekistan, 1 deputy per 15,000). The members of the Politburo of the All-Union Communist party were, as usual, elected to the supreme soviet of every federal republic. About 60% of the deputies were high party functionaries, members of the respective central committees, or provincial, district and town party committee secretaries, together with the ministers of internal affairs and state security and their provincial representatives. During April the supreme soviets met in the respective capitals to elect their presidia, form the republican councils of ministers and adopt the budgets.

Moscow continued distrustful of native leaders in the federal republics and the key positions of ministers of internal affairs and state security remained everywhere in Russian hands. The secretariats of the national Communist parties were also under Russian control, although for propaganda purposes a man with a native name was often advertised as first secretary.

The Economic Position.—Selected for the first time to present the traditional annual report to the soviet people, at the 34th anniversary celebrations of the Communist revolution on Nov. 6, L. P. Beria stated that the output of both heavy and light industry had increased substantially. Production of coal and lignite had risen by about 24,000,000 metric tons, of crude oil by 4,500,000 tons, of electric power by 13,000,000,000 kw.hr., of pig iron by 2,700,000 tons and of crude steel by about 4,000,000 tons. Beria affirmed that the national economic plan for 1951 would be fulfilled and overfulfilled. Industrial output expressed in comparable prices, whatever that meant, would be 15% higher than in 1950 and double that of 1940. As some industrial production figures were published for 1950, it was possible to estimate approximate totals for 1951 (*see* below). Coal production, which in 1940 was 0.8 tons per head, rose to 1.4 tons. Steel output rose between 1940 and 1951 from 91 kg. to 158 kg.

While recording that further progress had been achieved in agriculture, Beria omitted to disclose the extent of the 1951 grain harvest, merely stating that the average annual grain crop for several years past had exceeded 114,600,000 tons. Since actual production in 1950 was published as 124,700,000 tons, or 2,300,000 tons less than the target fixed in the postwar five-year plan, these results were plainly unsatisfactory, and the deficit in grain production was the more serious in the light of Beria's revelations concerning vital statistics. Between 1940 and 1951 the death rate had been halved and infant mortality had been reduced even more, while for several years the annual population increase exceeded 3,000,000. According to these figures the population by the end of 1951 would be about 15,000,000 to 18,000,000 more than in 1940, but grain production was 5,000,000 tons less than in 1940 (*see* below).

In Beria's statement there was no reference to livestock progress in 1951, which was the last year of a special three-year plan for the development of animal husbandry, but from a report published by the Central Statistical administration on Jan. 27 it was known that by the end of 1950 the Soviet Union had fewer cattle than had pre-revolutionary Russia, and fewer pigs, sheep and horses than in 1938 in a smaller territory (*see* below).

On housing Beria stated that during 1951 about 27,000,000 sq.m. of floor living space were to be made available in towns and industrial settlements. Since, according to Bulganin, in the years 1946–50 more than 90,000,000 sq.m. of floor living space had been built or rebuilt in the towns, the total available was 117,000,000 sq.m. The housing situation thus remained grave, for to restore prewar conditions in the war-damaged areas alone it was necessary, according to N. A. Voznessensky, to build more than 60,000,000 sq.m. of housing floor space.

Transport apparently was the Achilles heel of the economic system. During 1951 rail goods traffic, said Beria, had increased by 11% which was almost equal to the annual total of goods carried by the railways of Great Britain and France combined. As the French and British railways in 1950 transported 75,100,000,000 ton-km., the percentage revealed by Beria would suggest that the total goods traffic on soviet railways approached 758,000,000,000 ton-km., but in the United States, whose area was about one-third of that of the Soviet Union, railway goods traffic amounted in 1950 to 859,224,000,000 ton-km.

There seemed small probability in 1951 of any early publication of a new five-year plan. As far back as Jan. 9, 1948, the presidium of the supreme soviet had decided to replace the State Planning commission, which had ministry status, by three committees attached to the council of ministers, namely, the State Planning committee, the Committee for Material and Technical Supplies and the Committee for Introducing Advanced Technology, the last of which was discontinued in March 1951. (*See* also ATOMIC ENERGY; COMMUNISM; RUSSIAN LITERATURE.)

Education.—Schools (1951): primary, secondary and lower technical 220,000, pupils 37,000,000, teachers 1,600,000; universities 31 and institutions of higher education 849, students 840,000 and 407,000 taking correspondence courses. In the Russian S.F.S.R. there were 119,000 primary and secondary schools with a total enrolment of 18,000,000 pupils and a teaching staff of 760,000.

Agriculture.—Main crops (million metric tons):

	1913	1938	1940	1950 Plan	1950 Actual	1951 Est.
Grain	80.1	90.0	119.0	127.0	124.7	114.6
Sugar beets	10.9	16.7	21.8	26.0	24.3	?
Potatoes	23.3	65.6	84.2	115.3	?	?
Cotton	0.7	2.7	2.7	3.1	3.8	?

Livestock (million head, including those on collective farms, state farms and privately owned):

	1913	1938	1940	1950 Plan	1950 Actual
Cattle	60.6	63.2	71.0	65.3	57.2
Pigs	20.9	30.6	36.1	31.2	24.1
Sheep and goats	121.2	102.5	108.5	121.5	99.0
Horses	35.8	17.5	20.6	15.5	13.7

Industry.—Heavy industry production (million metric tons, electricity in 000,000,000 kw.hr.):

	1913	1940	1945	1950 Plan	1950 Actual	1951 Est.
Coal and lignite	29.1	166.0	150.0	250.0	264.0	288.0
Crude petroleum	9.2	31.0	19.5	35.4	37.6	42.1
Electric power	1.9	48.2	45.0	82.0	86.7	104.0
Pig iron	4.2	14.9	8.8	19.5	19.2	21.9
Crude steel	4.2	18.3	12.4	25.4	27.6	31.6

Foreign Trade.—Statistical data of the foreign trade of the Soviet Union are not published. Some idea of soviet foreign trade in post-World War II years may be obtained from the statistical data of the 12 western European countries (Austria, Belgium-Luxembourg, Denmark, France, western Germany, Italy, Norway, the Netherlands, Sweden, Switzerland, Turkey and the United Kingdom; million U.S. $ at current prices, f.o.b.):

	1938	1948	1949	1950	1951 (est.)
Imports from the U.S.S.R..	265	223	120	138	224
Same, to the U.K. alone	119	105	47	86	129
Exports to the U.S.S.R..	174	113	140	110	87
Same, from the U.K. alone	55	21	32	32	13

Soviet-U.S. trade (at current prices, 1950): U.S. imports from the U.S.S.R. $40,000,000, exports to the U.S.S.R. $1,000,000.

Transport and Communications.—Railways (1950 est.): 112,530 km.; the railways accounted for 83% of all goods traffic and 90% of all passenger traffic. Shipping (1950): 437 ships totalling 1,824,000 deadweight tons.

Finance.—Budget (000,000,000 roubles):

	1928	1938	1940	1949	1950	1951
Revenue	8.8	127.5	180.2	436.9	422.1	458.7
Expenditure	8.7	124.0	174.4	412.3	412.7	451.5

The external value of the rouble, high and fictitious: U.S. $1 = 4 roubles.

Unitarian Church.

The biennial general conference of the American Unitarian association was held in Montreal, Can., in Oct. 1951. The theme, "The Disciplines of Freedom," was introduced by the key speakers: E. C. Lindeman, of the New York School of Social Work; Hans Simons, president of the New School for Social Research; Rev. Henry H. Cheetham of London; and Georges Marchal of Paris, Fr. The conference was organized into groups and the new techniques of group dynamics enabled the 400 delegates to participate in the development of thought concerning the theme. The report of the Joint Commission on Federal Union with the Universalists was adopted and instructions were given to proceed with the development of plans. The conference nominated for the next moderator of the denomination Dexter Perkins, head of the history department of the University of Rochester, N.Y., and chairman of the Harvard Foundation for Advanced Study and Research.

During the year 3,884 new Unitarians joined the church, and 6 new churches and 18 new fellowships (memberships of less than 50) were added. Unitarian organizations were started in states where there had been none, such as Alabama and Mississippi. The Unitarian Service committee sent medical missions to Israel, Iran and Japan; a dental mission and institutes on public health planning and education and child care to Germany; and an engineering education mission to Japan. For three weeks in July the American Unitarian association was host to the Executive committee of the International Association for Liberal Christianity and Religious Freedom.

During the year, 17 new church schools, 26 new high school groups and 9 new college age groups were organized. The Women's alliance, which added 58 new groups, concentrated its social work on the problems of migrant workers and the implementing of the findings of the White House Conference on Youth. (*See* also CHURCH MEMBERSHIP.) (J. H. L.)

United Church of Canada.

The United Church of Canada, which in 1925 united the Presbyterian Church in Canada, the Methodist Church (Canada) and the Congregational Churches in Canada, reported for 1950 a membership of 821,199 with 1,965,300 persons under pastoral oversight, a Sunday school enrolment of 537,387 and 6,368 preaching places. The church owned property worth $143,911,196. The missionary and maintenance givings of the church in 1950 totalled $3,009,979, an advance over the previous year of $303,865.

Among the important events in the life of the United Church during 1951 were special campaigns of personal, congregational and mass evangelism, which resulted in 31,265 conversions; a high-level increase of candidates for the ministry; the sending of $45,000 for relief of churches in Europe and Asia; the resumption of negotiations on reunion with representatives of the Church of England in Canada; the raising of the minimum salary scale for married ministers to $2,600, with provision for travel grants and free use of furnished parsonage.

During 1951 the moderator, the Rt. Rev. C. M. Nicholson, visited the Canadian armed forces in Korea and some of the church's missionaries in Japan. (G. A. SI.)

United Nations.

Tension between the western powers and those states within the soviet orbit continued during 1951 to impair the effectiveness of the U.N. as a global organization dedicated to the maintenance of international peace and security and to the solution of economic and social problems by methods of international co-operation. Nevertheless, the U.N. was successful in denying the fruits of aggression in Korea, in strengthening collective security and in further developing and applying a program of technical aid to underdeveloped countries. The year 1951 saw further demonstration of the usefulness of the U.N. as an instrumentality of international co-operation even in a divided world.

Membership and Representation.—There was no change in the membership of the U.N. during 1951. The following states were members: Afghanistan, Argentina, Australia, Belgium, Bolivia, Brazil, Burma, the Byelorussian Soviet Socialist Republic, Canada, Chile, China, Colombia, Costa Rica, Cuba, Czechoslovakia, Denmark, the Dominican Republic, Ecuador, Egypt, El Salvador, Ethiopia, France, Greece, Guatemala, Haiti, Honduras, Iceland, India, Indonesia, Iran, Iraq, Israel, Lebanon, Liberia, Luxembourg, Mexico, the Netherlands, New Zealand, Nicaragua, Norway, Pakistan, Panama, Paraguay, Peru, the Republic of the Philippines, Poland, Saudi Arabia, Sweden, Syria, Thailand, Turkey, the Ukrainian Soviet Socialist Republic, the Union of South Africa, the Union of Soviet Socialist Republics, the United Kingdom, the United States of America, Uruguay, Venezuela, Yemen and Yugoslavia.

The question of the admission of new members continued to be a subject of discussion. The designation of Italy as administering authority for Somaliland raised the question of Italian membership in the U.N. On Dec. 7, the general assembly passed a resolution expressing the opinion that Italy should be a member of the Trusteeship council in order to be in the position to carry out its responsibilities under the trusteeship system and to that end recommending that the Security council act favourably on the Italian application for membership in the U.N. However, the soviet veto prevented the council from doing this. The soviet position continued to be that it would not support the application of states favoured by the western powers so long as they opposed applications supported by the Soviet

Union. The Japanese peace treaty, signed at San Francisco, Calif., on Sept. 8, envisaged the admission of Japan to the U.N., but this appeared a distant eventuality so long as the great power deadlock continued.

The question of representation of the republic of China in the organs of the U.N. continued to be a controversial issue during 1951. At the end of the fifth session of the general assembly on Nov. 5, the soviet delegation made an unsuccessful attempt to get a resolution adopted placing the question on the agenda of the sixth session. When the sixth session convened, this effort was repeated. The general assembly not only rejected the soviet proposal but also recommended that for the duration of the Paris session, the general assembly refuse further to consider the question. Obviously, the majority of members were influenced by the U.S. argument that the Central People's government should not be permitted to shoot its way into the U.N.

Organization and Meetings.—The fifth session of the general assembly continued until Nov. 5, 1951. It was the longest session in the history of the U.N. The length of the session resulted from the fact that it was considered desirable to have the First committee (political and security) continuously in session to deal with any new developments in the Korean situation and the general assembly itself to take action on any recommendations that the First committee might make. The First committee consequently assumed in practice one of the functions which the Interim committee, initially established in 1947, had been expected to perform.

The sixth session of the general assembly convened at the Palais de Chaillot in Paris, Fr., on Nov. 6. Luis Padilla Nervo of Mexico was elected president.

Following the customary opening general debate, the assembly adopted an agenda of 68 items on Nov. 13, and allocated them to the main committees for consideration. Among the more important substantive items included on the agenda were the following: the Korean question; the regulation of armaments; the report of the Collective Measures committee; Libya; Palestine; the treatment of people of Indian origin in the Union of South Africa; appointment of a commission to explore the possibilities of holding elections in eastern and western Germany; the draft International Covenant on Human Rights; the refugee problem in its various aspects; technical assistance and economic development; problems of nonself-governing territories and trusteeship; co-ordination of specialized agencies; and the 1952 budget. Inasmuch as the assembly convened so late in the year, it was anticipated that the sixth session would not conclude its main work until Feb. 1952.

The Security council during 1951 still suffered from the loss of prestige and effectiveness resulting from the continuing deadlock among its permanent members. In particular, it ceased to be the organ dealing with the complaint of aggression against the Republic of Korea, the issue having been removed from its agenda on Jan. 31 before the adoption of the general assembly resolution of Feb. 1. The membership of the council during the year included the five permanent members—China (represented by the nationalist government), France, the U.S.S.R., the U.S. and the United Kingdom—and by six nonpermanent members—Brazil, Ecuador, India, the Netherlands, Turkey and Yugoslavia. During its sixth session, the general assembly elected Chile, Pakistan and Greece to replace Ecuador, India and Yugoslavia for two-year terms ending Dec. 31, 1953. The election of Greece was preceded by a long and bitter debate and 18 inconclusive ballots in the general assembly. Many delegations felt that the U.S. sponsorship of Greece violated a gentleman's agreement dating from early 1946, according to which the eastern European countries were to have the right in effect to select one nonpermanent member of the council. Byelorussia was the candidate of this group of states and in the early voting had an advantage over Greece, supported by the U.S. On the 19th ballot, however, as the result of numerous delegation shifts, Greece received 39 votes as against 16 for Byelorussia, with 5 abstentions, and was declared elected.

U.N. TRUSTEESHIP COUNCIL members reviewing a petition in the Cameroons in 1951, as part of a regular program of supervising the progress of U.N. trust territories toward self-government or independence

The Economic and Social council held two sessions in 1951. The 12th session was held in Santiago, Chile, from Feb. 20 to March 21, 1951, while the 13th session met at Geneva, Switz., from July 30 to Sept. 21. Hernan Santa Cruz served as president of the council during both sessions. During 1951, the council's membership was as follows: with terms ending Dec. 31, 1951—Belgium, Chile, China, France, India and Peru; with terms ending Dec. 31, 1952—Canada, Czechoslovakia, Mexico, Iran, Pakistan and the U.S.; and with terms ending Dec. 31, 1953—the Philippines, Poland, Sweden, the U.S.S.R., the United Kingdom and Uruguay. During its sixth session, the general assembly elected the following to membership on the council for three-year terms ending Dec. 31, 1954—Argentina, Belgium, China, Cuba, Egypt and France.

At its 13th session in Geneva, the Economic and Social council gave special consideration to questions of organization and functioning in the light of six years of experience. The council decided to hold two sessions annually, the second to be opened before the annual session of the general assembly and to be resumed toward the end of the session or soon thereafter. It also decided to plan its basic program of work and calendar of conferences for each year in advance. It made some important changes in its subsidiary organization. It decided to continue its regional commissions indefinitely. One functional commission—economic employment and development—and a number of subcommissions it voted to discontinue. The following functional commissions it decided to retain, in most cases with less frequent meetings: human rights, narcotic drugs, statistical, fiscal, transport and communications, social, population, and status of women.

The Trusteeship council held two sessions during the year.

The eighth session met at Lake Success, N.Y., from Jan. 30 to March 16, 1951, and the ninth session met at Flushing Meadow, N.Y., from June 5 to July 30. Max Henriquez Urena of the Dominican Republic served as president during the eighth session while Sir Alan Burns of the United Kingdom occupied the president's chair during the summer session. The membership of the council was as follows: members administering trust territories—Australia, Belgium, France, New Zealand, the United Kingdom and the U.S.; members by virtue of their permanent seats on the Security council—China and the U.S.S.R.; and members elected by the general assembly—Argentina, the Dominican Republic, Iraq and Thailand.

The terms of five members of the International Court of Justice expired on Feb. 5, 1952, and one vacancy in the court was caused by the death of Judge José Philadelpho de Barros e Azevedo (Brazil) whose term of office normally would have expired in Feb. 1955. To fill the vacancy, the general assembly and the Security council, voting concurrently, elected Levi Fernandes Carneiro (Brazil). For terms of nine years beginning Feb. 5, 1952, the assembly and the council elected Sergei A. Golunsky (U.S.S.R.), Green H. Hackworth (U.S.), Helge Klaestad (Norway), Sir Benegal N. Rau (India) and E. C. Armand Ugon (Uruguay). During 1951, the court was asked by the United Kingdom to give a judgment in its dispute with Iran over oil rights. (*See* INTERNATIONAL LAW; IRAN.)

Administration and Finance.—During 1951 the internal organization of the secretariat did not undergo any radical change. On Sept. 24, Sec.-Gen. Trygve Lie announced the appointment of Guillaume Georges-Picot (France) as assistant secretary-general in charge of the department of social affairs, to succeed Henri Laugier, the appointment to take effect Oct. 22. On Aug. 25 and 30 the administrative tribunal announced decisions on appeals by staff members against termination of employment by the secretary-general. These decisions were significant in that they laid down the principle that the secretary-general's power, even with respect to staff members under temporary contracts, was subject to certain limitations in the interest of due process, including the right of appeal.

The transfer of the secretariat from Lake Success to the permanent headquarters in New York city was completed early in 1951. On March 28, a special postal agreement between the U.N. and the U.S. providing for the operation of a U.N. post office was signed; the first U.N. stamps were issued on Oct. 24. The U.N. field service, established in July 1950, developed to a force of 125 men representing 26 countries. Members of the field service served during 1951 in India, Pakistan, Korea, Israel, Lebanon, Eritrea, Libya, the former Italian Somaliland, the Balkans, Afghanistan and Japan, as well as at the U.N. Headquarters and in Geneva.

The secretary-general's budget estimates for 1952 called for total expenditures of $46,568,300, compared with total appropriations of $47,798,600, approved by the general assembly for 1951. The U.N. Advisory Committee on Administrative and Budgetary Questions proposed a reduction of $2,035,400 in the secretary-general's budget estimates, bringing them down to $44,532,900. The general assembly's Administrative and Budgetary committee recommended a budget of $48,096,780, which was approved by the general assembly on Dec. 21. The increase over both the secretary-general estimates and the recommendations of the advisory committee represented increased appropriations for investigations and commissions and the tentative provision of a cost-of-living increase for the U.N. staff.

The Committee on Contributions recommended to the general assembly changes in the assessments rates of 33 countries. It recommended an increase in the contribution of the Soviet Union from 6.98% to 9.85% and slight increases in the rates of other eastern European countries. It proposed the lowering of the U.S. contribution to 36.90%, a reduction of 2.02%. The recommendations of the committee were adopted by the general assembly after approval by its Administrative and Budgetary committee.

Political Problems.—Although the Korean question continued to dominate the political scene, the U.N. dealt with a number of other important questions during 1951, including Palestine, Kashmir, the Iranian oil dispute, the unification of eastern and western Germany, and disarmament.

Korea.—The Korean question remained the focal point of attention in U.N. action during 1951. On Dec. 14, 1950, the general assembly had appointed a cease-fire committee to explore the basis of a cease-fire in Korea. After several unsuccessful efforts, the committee reported on Jan. 3, 1951, that it had thus far failed in its mission. On Jan. 11, the committee submitted a set of basic principles to guide the U.N. in its further attempts to achieve some agreement with the Chinese Communist government, and these were adopted by the Political and Security committee of the general assembly on Jan. 13. These principles envisaged an immediate cease-fire, consideration of further steps for the restoration of peace, the withdrawal by stages of all non-Korean armed forces, the creation of appropriate interim arrangements for the administration of Korea and the establishment by the assembly of a body consisting of the People's Republic of China, the United Kingdom, the U.S.S.R. and the U.S. to achieve a settlement of far eastern problems. These principles were conveyed to Communist China, which rejected them, repeating its demands that political negotiations must precede a cease-fire and should be based on an agreement to withdraw all foreign forces from Korea. Furthermore, it repeated its demands that the People's Central government replace the nationalist government as the representative of China in the U.N., and it insisted that the negotiations cover the removal of the U.S. 7th fleet from the waters surrounding Formosa and other far eastern problems.

While some delegations thought this reply from Communist China offered the basis for further negotiation, other representatives, led by the U.S., insisted that the Peking government left no alternative to the U.N. other than labeling them as aggressors in Korea and applying sanctions. The U.S. delegation introduced a resolution to this effect which with minor modifications the general assembly approved on Feb. 1 by a vote of 44 to 7 with 9 abstentions, after its First committee had rejected a resolution, submitted by the Asian-Arab states, calling for a conference to seek further elucidation of the position of the Peking government.

The Feb. 1 resolution found that the People's Republic was guilty of aggression, called upon it to cease hostilities, affirmed the determination of the U.N. to continue military operations to restrain this aggression, called on all U.N. members to continue to assist U.N. action in Korea, set up an Additional Measures committee (membership of which was to include the members of the Collective Measures committee) to study ways and means of meeting the Chinese Communist aggression through the application of sanctions and proposed that the president of the assembly establish a Good Offices committee to continue the search for a peaceful solution of the Korean problem. This committee was further to explore the possibilities of peaceful settlement before the Additional Measures committee made any report.

The Good Offices committee was established, but met with no success, it being apparent that the Communists were committed to seeking a decisive military result. In May the Additional Measures committee reported that many U.N. members had already imposed embargoes on war material to Communist China, and it recommended that all other members do likewise. The general assembly on May 18 adopted these recommendations, called on each state to report to the Additional Measures committee on the measures it was taking to implement this resolution and requested that the committee continue to study ways of strengthening the measures being taken. Fifty-one members and 13 nonmembers replied to an inquiry from the committee as to measures taken. The overwhelming majority indicated their compliance or that the recommendations did not apply to them.

During the early months of 1951 the military situation in Korea substantially altered. By the end of February the U.N. forces had regained the offensive; they recaptured Seoul in March and in April crossed the 38th parallel in force. Communist offensives in late April were checked and proved very costly. It had become apparent, especially with the removal of Gen. Douglas MacArthur as U.N. commander on April 11, that the objectives of U.N. military operations were to drive the Communists back to the 38th parallel, to establish a strong military line and to make the Communists pay heavily for their aggression. Reflecting an apparent awareness of their inability to achieve a decisive result, reports in early June suggested that the Communists were prepared to consider a cease-fire. On June 23, the soviet delegate to the U.N., Jacob Malik, speaking on a U.N. radio program, stated that his government considered the time appropriate for initiating cease-fire talks. The U.N. commander, Gen. Matthew B. Ridgway, was instructed by the 16 members having troops in Korea to sound out the Communists on the possibility of cease-fire negotiations. In a broadcast to the commander-in-chief of the Communist forces in Korea on June 30, General Ridgway proposed that cease-fire negotiations be undertaken. The Communist authorities accepted the proposal. The negotiations got under way on July 10 at Kaesong, the delay being caused by a disagreement on the meeting place.

By the end of 1951, some progress had been made, but the negotiating teams still remained far apart on important issues. (For an account of the progress of the war and of the peace negotiations during 1951, *see* KOREAN WAR.) On Nov. 27, a cease-fire line was conditionally agreed upon, and a 30-day deadline was fixed for concluding an armistice. At the year's end, the negotiations were continuing, as was the lull on the battlefield, with a short extension of the Nov. 27 cease-fire agreement in effect.

Meanwhile, in Paris the general assembly awaited the outcome of the Korean talks before taking up the Korean question in committee. The assembly received the annual report of the U.N. Commission for the Unification and Rehabilitation of Korea, which was established by the assembly's fifth session in Oct. 1950. The commission's report asserted that the political objective of the U.N. must remain the establishment of a unified, independent and democratic Korea. (*See* also CHINA; KOREA.)

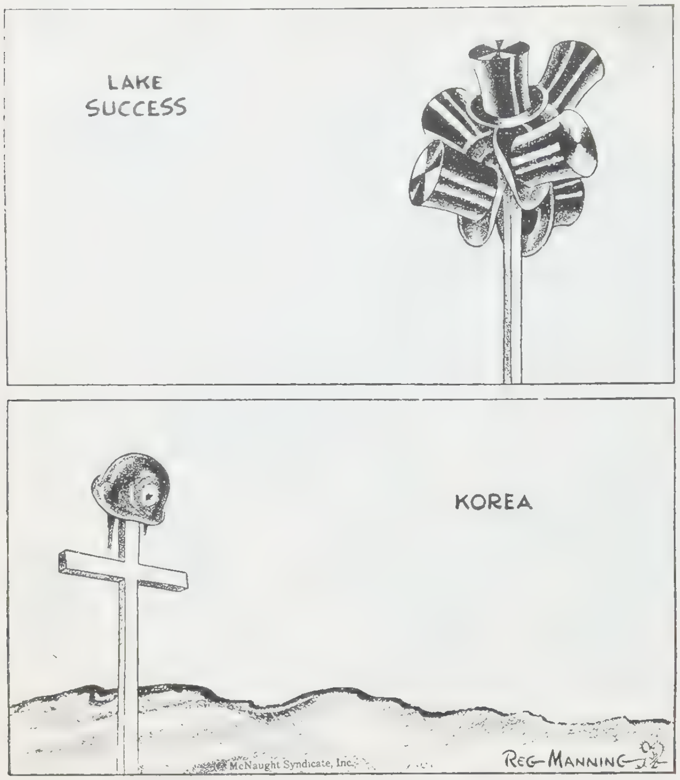
Palestine.—Although armistice agreements had been in force between Israel and the Arab states with the exception of Iraq since 1949, the Palestine situation remained unresolved. On two occasions during 1951 continuing tension gave rise to disputes requiring the intervention of the Security council. The U.N. Conciliation Commission for Palestine made no progress in its effort to find a permanent solution of the Palestine problem.

The first dispute involving Israel and Syria resulted from operations undertaken by the government of Israel to drain the Hula marshes and to straighten and deepen parts of the Jordan river included in the demilitarized zone. The Syrian government claimed that these operations, involving some displacement of Arab inhabitants, were in violation of the armistice agreement. The Israeli government complained that Syria had illegally resorted to the use of armed force. The complaints were brought before the Mixed Armistice commission and the Security council in April. The commission was instrumental in getting agreement on a cease-fire for May 4 which was not effective, however, in bringing fighting to an end. The council adopted two resolutions, May 8 and 18 respectively, calling for a cease-fire, respect for the terms of the armistice agreement and acceptance of the authority of the Mixed Armistice commission to settle disputes regarding the application of the agreement. The terms of the council's resolutions were accepted by the parties.

COMMITTEE MEMBERS of the International Labour organization joining Indians in a dance at the school of Warista in Bolivia. The I.L.O. committee was meeting there to confer on helping indigenous labour

The second dispute concerned Egypt's practice of imposing restrictions on ships going to Israel through the Suez Canal. Egypt claimed that it had the right to stop neutral shipping since it was technically at war with Israel, despite the fact that an armistice agreement had been signed between the two states. After a series of meetings in July and August, the Security council on Sept. 1, by a vote of 8 to 0 with 3 abstentions, adopted a resolution, introduced by France, the United Kingdom and the U.S., asserting that under international law Egypt's claim was not valid and calling upon Egypt immediately to terminate the restrictions. The Egyptian representative stated that his government reserved its rights.

The U.N. Conciliation Commission for Palestine continued its efforts to bring Israel and the Arab states—Egypt, Jordan, Lebanon, and Syria—into a peaceful agreement. Among the outstanding issues that remained unsettled were the refusal of Israel to repatriate more than a fraction of the many Arabs who were forced to vacate their homes in Palestine during the hostilities or to give them compensation, the status of Jerusalem and control over the Jordan river which caused trouble in the spring of 1951. The commission attempted, in a series of meetings held in Paris beginning Sept. 13, to bring Israel and the Arab states together on a series of proposals which the commission submitted. These efforts were thwarted, however, by the refusal of the Arab representative to meet with Israeli representatives and by irreconcilable differences between the Israeli and Arab positions. The Arab states refused to negotiate unless Israel promised to accept all of the Arab refugees, and the Israeli delegation likewise remained adamant in its position of



"HATS," the 1951 Pulitzer prize cartoon, drawn by Reg Manning of the McNaught Syndicate, Inc.

not being able to accept more than a few Arabs. On Nov. 21, the commission announced that it was terminating its conference. The situation remained deadlocked, and the general assembly had taken no further action at the end of the year. (*See* also EGYPT; ISRAEL; SYRIA.)

Kashmir.—For progress during 1951 toward a final solution of the Kashmir problem, *see* the articles INDIA; KASHMIR; PAKISTAN.

Anglo-Iranian Oil Question.—Following the nationalization of Anglo-Iranian Oil company properties by the Iranian government in April and early May, the United Kingdom instituted proceedings before the International Court of Justice on May 26 requesting a judgment in the case on its merits. On June 22, the United Kingdom asked the court to order provisional measures to preserve existing rights. The Iranian government denied the court's jurisdiction. On July 5, the court indicated certain provisional measures to be observed by both parties pending further consideration of the case. In view of Iran's disregard of the court's orders, the government of the United Kingdom brought the question before the Security council which decided on Oct. 1 to take up the complaint. Consideration of the complaint was postponed until Oct. 15 to permit Prime Minister Mohammed Mossadegh of Iran to arrive to state his government's position. In the interval British technicians were forced to leave Iran. The Iranian government contended that the matter was wholly within its domestic jurisdiction. After six meetings devoted to the discussion of the question, the Security council adjourned debate until the court had ruled on its own competence in the matter. (*See* also IRAN.)

Unification of Germany.—Early in the sixth session of the general assembly, the United Kingdom. France and the U.S. introduced a resolution in the Ad Hoc Political committee calling for the establishment of a commission to explore the possibility of holding elections in eastern and western Germany with a view to eventual unification. The Soviet Union objected, not only to the proposal, but also to summoning representatives from eastern and western Germany to Paris for testimony. Representatives from both German governments, however, presented their views, the Bonn group advocating the establishment of such a commission and the East German Democratic Republic arguing that this constituted unwarranted intervention in Germany's internal affairs. The general assembly adopted a resolution on Dec. 20, by a vote of 45 to 6 with 8 abstentions, calling for the establishment of such a body, and naming Brazil, Iceland, the Netherlands, Pakistan and Poland to be members of the commission. Poland stated that it would not serve on the commission, and eastern Germany announced that it would not permit the commission to investigate conditions there.

Regulation of Armaments.—Once again in the sixth session of the general assembly, this subject was in the forefront of attention. In its fifth session, the general assembly had decided on a new approach to the whole matter, by appointing a committee to study and report on the establishment of a new consolidated disarmament commission. Two days after the sixth session of the general assembly began, Secretary of State Dean Acheson (U.S.) invited a new approach to the question by submitting a proposal sponsored by the U.S., the United Kingdom and France. This proposal called for the disclosure and verification of existing armaments, the reduction of armaments by successive stages, agreement on criteria determining the size of armed forces, the acceptance of the U.N. plan for the control of atomic energy as a basis for further discussions and the concurrent consideration of political questions. The U.S.S.R. delegation rejected the three-power proposal and called for a world conference by June 1952 for the reduction of armaments and the prohibition of atomic bombs, with no apparent provision for effective inspection or control. Both of these proposals were embodied in draft resolutions submitted to the First committee. The committee established a subcommittee consisting of representatives of the United Kingdom, France, the U.S. and the U.S.S.R., together with the assembly president, Luis Padilla Nervo, to formulate proposals which would meet with general approval. The subcommittee on Dec. 10 reported agreement on the establishment of a new 12-member U.N. disarmament commission but complete disagreement on other elements of an acceptable disarmament plan. On Dec. 19, the First committee approved the three-power draft substantially as introduced. On Jan. 11, 1952, by a vote of 42 to 5 with 7 abstentions, the general assembly adopted the resolution.

The resolution called for the establishment of a disarmament commission (to replace the existing Atomic Energy and Conventional Armaments commissions) which was to be composed of the 11 members of the Security council, plus Canada. The new commission was directed to prepare proposals for regulation, limitation and balanced reduction of all armed forces and armaments, the elimination of major weapons of mass destruction and effective international control of atomic energy. Although the soviet bloc voted against the resolution, the U.S.S.R. announced that it would serve on the new commission.

The Balkans.—After four years of surveillance of Balkan affairs, the U.N. Special Committee on the Balkans was terminated by a general assembly vote of 48 to 5 on Dec. 7. It was replaced by a Balkan subcommission of the Peace Observation commission, established under the Uniting for Peace resolution of Nov. 3, 1950.

Economic and Social Co-operation.—In the field of economic and social well-being, U.N. operations during 1951 stressed technical assistance, human rights and aid to refugees and stateless persons.

Technical and Economic Assistance.—The U.N. program for technical assistance to underdeveloped states made considerable headway in 1951. The Technical Assistance administration was established as a branch of the U.N. secretariat. Some 252 agreements were signed with 45 governments providing for 741 experts and 551 fellowships to assist the underprivileged nations in their efforts to raise their standards of living and improve their basic industries and agriculture. Technical assistance programs approved varied from very short-range projects to broad changes in the basic economic foundation of the underdeveloped country. Of special significance was the agreement concluded with Bolivia by which Bolivia undertook to accept U.N. advisers in various departments of administration, their activities subject to co-ordination and supervision by a U.N. representative. The question of the continuation of the expanded technical assistance program was considered by the general assembly in its sixth session. Funds for the first year and a half had been raised on the basis of pledges made by governments participating in the Technical Assistance conference of 1950. Roughly $20,000,000 was initially pledged. The Second committee (economic) of the general assembly on Dec. 6, 1951, adopted recommendations to continue this method of financing the program for the future.

With respect to economic assistance to underdeveloped states, the Economic and Social council, as well as several of its commissions, undertook studies which recommended methods to facilitate the flow of capital to these countries. It was recognized that unless capital was channeled toward these countries and unless their financial structure achieved some element of stability, the over-all assistance program could not succeed. At the 13th session of the Economic and Social council, it was suggested that an international fund be established to supply grants and low-interest loans to underdeveloped countries, but the capital-exporting countries led by the U.S. insisted that these countries must first attempt to undertake basic economic and social reforms before substantial capital was directed to them. The council, in its recommendations to the general assembly, asserted that both capital-exporting and capital-importing countries should take concrete steps to facilitate the flow of money into the needy countries. In line with earlier discussions as well as the council's recommendations, the Second committee of the general assembly on Dec. 13 voted 28 to 20 with 9 abstentions to establish an international fund for economic development which would provide grants and loans. In the face of strong U.S. opposition, the proposal was approved by the general assembly, by a vote of 30 to 16 with 11 abstentions. The council on Jan. 12, 1952, was directed to prepare a program for the consideration of the assembly at its next session.

Human Rights.—By the end of 1951, very little progress could be reported in the attempted formulation of an International Covenant of Human Rights. The Human Rights commission's spring session in Geneva prepared a draft of economic, social and cultural rights to be included in the covenant though many states insisted that the covenant should contain only political rights. The Economic and Social council decided to request the sixth session of the general assembly to review the entire human rights program. The fifth session of the general assembly had established a 15-nation committee to construct a new draft of the Convention on Freedom of Information, first prepared in 1948. The committee early in 1951 prepared a new draft; the Economic and Social council, however, decided against convening a special conference to consider the draft prepared by the committee. Instead, it recommended that the assembly take no further action on the proposed convention for the present.

The question of the treatment by the Union of South Africa of nationals of Indian origin became more acute in 1951. The general assembly in its fifth session had recommended further negotiations between India and the South African government; however, in the middle of these negotiations, in Feb. 1951, the South African government enacted further legislation designed to segregate the South African Indians, and the Indian government withdrew from the talks. Furthermore, in March, the South African government reiterated its previous assertion that this matter was one within the domestic jurisdiction of their government and that it could not accept the assembly's resolution calling for further conferences. India placed this matter before the sixth session of the assembly.

The general assembly was asked to consider another difficult question when the Arab states requested it to consider their complaint that French actions in Morocco violated the U.N. charter and the Universal Declaration on Human Rights. Although the assembly by a close vote of 28 to 23 with 7 abstentions on Dec. 13 decided not to place the matter on its agenda, the debate concerning the issue was marked with unusual bitterness.

Refugees and Migration.—During 1951 the International Refugee organization (I.R.O.) was engaged in closing out its operations. Jan. 31, 1952, was the date set for the final termination of its activities. On Feb. 1, the Provisional Intergovernmental Committee for the Movement of Migrants from Europe was scheduled to take over a segment of the organization's responsibility. It was not anticipated, however, that the committee and the U.N. High Commission for Refugees—G. J. Van Heuven Goedhart took office Jan. 1, 1951—working together and with the full co-operation of governments would be able to do adequately what the I.R.O. had been able to achieve. As a further approach to the problem, a convention relating to the status of refugees was drafted in July which was designed to guarantee basic rights to refugees. It called on governments to facilitate the efforts of refugees either to repatriate themselves to their native lands or to settle in new areas.

The U.N. Korean Reconstruction agency, although better off financially, was confined to quite limited activity because of the protracted Korean conflict. The agency's director, J. Donald Kingsley, former director of the I.L.O., made some progress on long-range planning for Korean relief, and prepared to undertake extensive relief measures for Korean refugees once the military and political situation in Korea permitted such action.

Specialized Agencies.—An important part of the work during 1951 in the area of international economic and social cooperation was performed by the specialized agencies, international organizations set up on the basis of their own constitutions for specialized purposes and brought into relation with the U.N. by agreements concluded by the appropriate organs of the U.N. and the particular specialized organizations in question. During 1951 the following specialized agencies were in actual operation:

International Labour Organization (I.L.O.).—Headquarters in Geneva, Switz.; David A. Morse, director-general; 65 members. *See* separate article.

Food and Agriculture Organization (F.A.O.).—Headquarters in Rome, It.; Norris E. Dodd, director-general; 70 members. *See* AGRICULTURE. Notices of withdrawal were given by Hungary (effective Jan. 25, 1952) and China (effective July 20, 1952).

International Monetary Fund.—Headquarters in Washington, D.C.; Camille Gutt, managing director; 50 members. *See* separate article.

International Bank for Reconstruction and Development.—Headquarters in Washington, D.C.; Eugene R. Black, president; 50 members. *See* separate article.

International Civil Aviation Organization (I.C.A.O.).—Headquarters in Montreal, Que.; Edward Warner, president of the council; 57 members.

International Refugee Organization (I.R.O.).—Headquarters in Geneva, Switz.; J. Donald Kingsley, director-general; 18 members. Operations terminated Jan. 31, 1952. *See* REFUGEES.

United Nations Educational, Scientific and Cultural Organization (U.N.E.S.C.O.).—Headquarters in Paris, Fr.; Jaime Torres Bodet. director-general; 64 members.

World Health Organization (W.H.O.).—Headquarters in Geneva, Switz.; Brock Chisholm, director-general; 68 members plus one associate member (Southern Rhodesia).

International Telecommunications Union (I.T.U.).—Headquarters in Geneva, Switz.; Leon Mulatier, secretary-general; 85 members (including colonial areas).

Universal Postal Union (U.P.U.).—Headquarters in Berne, Switz.; Fritz Hess, director of the international bureau; 89 members (including colonial areas.)

World Meteorological Organization (W.M.O.).—Headquarters in Geneva (formerly Lausanne), Switz.; G. Swoboda, chief of the secretariat; 74 members.

The constitutions of two additional specialized agencies had been drafted and signed by the end of 1951 but had not entered into force by receiving the necessary ratifications. The convention establishing the Inter-Governmental Maritime Consultative organization (I.M.C.O.) had been ratified by eight states. Ratification by 21 states, including the principal maritime powers, was required. The constitution of the International Trade organization (I.T.O.) had not been ratified by any signatory. The Interim committee (52 members) continued to function.

Aid to Nonself-Governing Peoples.—The work of the U.N. in this expanding field of the organization's activities may be described under three main categories: (1) action taken under chapter xi of the charter to improve conditions in nonself-governing territories; (2) action taken in connection with the administration of the trusteeship system; and (3) action taken under other provisions of the charter or in the discharge of responsibilities conferred by separate international agreements.

The Special Committee on Information Transmitted under Article 73 (e) of the Charter, created by the general assembly to consider and report on information submitted to the secretary-general, placed particular emphasis during the year on economic development, raising nutritional levels and land reform. The committee also undertook a study of methods to improve its machinery, especially the standard form which guides the administering countries in preparing their reports. Much discussion centred around the possibility of requesting that political information be supplied to the U.N. by the administering authorities (the charter requires only that technical information be submitted) and also the possibility of bringing some nongovernmental organizations into the framework of assistance to the dependent territories. In regard to technical assistance to these territories, a notable achievement in 1951 was the signing of a basic agreement between the United Kingdom and the Technical Assistance board providing for U.N. technical assistance to the dependent territories under British administration. W. J. A. Kernkamp of the Netherlands was elected chairman of the special committee for 1951, and the main session of the committee was held in Geneva from Oct. 2 to Oct. 19.

The Trusteeship council, in its two sessions in 1951, considered reports from the administering authorities of Tanganyika, Western Samoa, Ruanda-Urundi, the Cameroons (English and French), Togoland (English and French), New Guinea, Nauru, Trust Territory of the Pacific Islands and Somaliland. It received petitions from the people in the trust territories and set up an Ad Hoc Committee on Petitions at its ninth session. The council recommended to administering authorities that they take steps to improve facilities for higher education in trust territories and that they make use of the expanded program for technical assistance of the U.N.

The council paid special attention to the structure, duration and effectiveness of its visiting missions. A visiting mission was sent to East Africa in Aug. 1951.

The council, in both of its 1951 sessions, continued to study and make recommendations on the Ewe question. The Ewe people, more than 800,000 in number, are West Africans and have common language, traditions and customs, but are divided into three administrative areas, the two trust territories of British Togoland and French Togoland, and the Gold Coast, a self-governing British dependency. A consultative commission was established in 1950 in an attempt to seek some agreement between the administering authorities and the Ewe peoples in regard to the Ewe demand for unification. Because of a dispute concerning the election of Ewe representatives from French Togoland, the Ewes refused further to participate in the commission. Therefore, in 1951 a joint council consisting of representatives from both Togolands was set up by the administering authorities, replacing the consultative commission. It was designed to establish closer relations between the two trust territories and to coordinate views on the eventual unification of the Ewe peoples. The Trusteeship council in its ninth session approved of the establishment of the joint council but suggested that it be broadened in scope to permit wider participation by the Ewe people.

On Dec. 24, 1951, the former Italian colony of Libya became the first dependent area to enter the ranks of statehood under the full auspices of the U.N., thus marking a successful attempt by the U.N. to facilitate independence among dependent territories. The U.N. recognized that Libya would continue to need technical and economic assistance, which Great Britain and France, the former administering authorities, had supplied in the past. The Economic and Social council considered this problem during its 13th session and passed a resolution to the effect that Libya should continue to receive aid under the U.N. Technical Assistance program after it became a state and before it achieved membership in the U.N. (*See* LIBYA.)

The two other former Italian colonies, Eritrea and Somaliland, remained under U.N. tutelage. A U.N. commissioner, Eduardo Anze Matienzo of Bolivia, assisted the United Kingdom as the administering authority in preparing Eritrea to become an autonomous unit federated with Ethiopia under the sovereignty of the Ethiopian king. Somaliland, designated to become an independent country in 1960, was under trusteeship with Italy as the administering authority and a U.N. advisory council assisting in guiding the territory toward independence. (*See* also EDUCATION; INTERNATIONAL LAW; PHILATELY; PRISONERS OF WAR; TRUST TERRITORIES.) (L. M. GH.)

United States.

Final figures of the 1950 census showed the population of the U.S. to be 150,697,361; it was estimated at 154,353,000 on July 1, 1951 (for full details *see* CENSUS DATA, U.S.).

The year 1951 opened in unusual uncertainty because of the tensions created by the international situation. On Dec. 16, 1950, Pres. Harry S. Truman had declared a national emergency and outlined the plans for placing the United States on a war footing. In Asia and in Europe the United States seemed at a point of vital decision in foreign policy.

Throughout 1951 events outside the United States, actions of foreign powers and the debates and decisions of the United Nations determined in large measure the actions, policies and declarations of the representatives of the United States. The foreign policies of the administration were revealed not only in declarations of the president but by actions of the military officers of the United States, by attitudes and interpretations of the state department, and by the debates and actions of the senate and house of representatives. In the public debates in press, on the platform and even the radio, outstanding public figures not in national office—in particular Herbert Hoover, Harold Stassen, Thomas E. Dewey and Gen. Douglas MacArthur—had a part in the development of public opinion on foreign affairs.

Debate on Foreign Policy.—Prior to the recall of General MacArthur, much of the debate in the United States had centred around aid to Europe. In his inaugural address as governor of New York, Dewey on Jan. 1 called for a ring of bases around the world. By mid-January the basic issues in the debate were clearly seen in the discussion in the senate on the question of sending additional U.S. troops to Europe. The solutions proposed were varied and conflicting. Much time was spent in discussing the constitutional power of the president (in use of troops) and the extent to which congress had been consulted on policies of the United Nations in Korea. On Feb. 9 Herbert Hoover re-entered the debate he had initiated in 1950, and in a radio broadcast outlined a ten-point program, including full recognition of Japan and Germany and an increase in air and naval power. Later in the month, in testifying before a congressional committee, he advocated a limitation upon sending of U.S. troops to Europe. The debate widened; Dewey asked that Greece and Turkey be included in the North Atlantic pact, and Representative Joseph W. Martin of Massachusetts, minority leader in the house, asked that forces of Chiang Kai-shek be permitted to open a second front against the Communists in China.

GEN. DOUGLAS MacARTHUR addressing a joint congressional session in Washington, D.C., April 19, 1951, after his return from Japan. Behind him are Vice-President Alben Barkley (left) and Speaker of the House Sam Rayburn

War in Korea.—Primary in the public interest was the state of the war in Korea. On the first of the year, the Communist forces launched a long-anticipated drive and with heavy casualties made such progress that the United Nations forces abandoned Seoul on Jan. 4. By Jan. 7 the enemy was 45 mi. S. of the 38th parallel. The drive continued with diminished force, and by Jan. 25 the United Nations forces had regained the initiative. The fighting with gains and losses for both sides continued for several weeks. On Feb. 13, after a visit to the front, General MacArthur stated that any talk of recrossing the 38th parallel was "purely academic." Three days later President Truman stated that General MacArthur had full discretion in crossing the 38th parallel "if military considerations dictate," but that he (the president) would discuss political questions with the United Nations.

Throughout the balance of February, the Communist forces were in retreat, and it was stated that their losses were "the bloodiest of modern times." By the end of the first week in March, General MacArthur stated that the battle lines "will soon reach a point of theoretical military stalemate" and that the United Nations could not win so long as the Chinese Communists could base their forces in Manchuria. The United Nations forces continued to advance, and Gen. Matthew B. Ridgway stated that should the war end with the United Nations at the 38th parallel "it would be a tremendous victory." On March 14 the United Nations forces entered Seoul, the enemy retreating without a fight. On March 24 General MacArthur issued a statement in Tokyo offering to confer in the field with leaders of the enemy on an armistice. On April 11 he was relieved of his command, and General Ridgway was named his successor. The advance of the United Nations forces continued. Although on May 16 the Communists launched a new offensive, it was quickly stopped, and the United Nations forces continued to advance in North Korea. From April 11 to June 25, the attention of the nation was fixed on the MacArthur hearings (*see* MACARTHUR INVESTIGATION), during which the outlook of the Korean conflict was not unfavourable to the United Nations forces. At this time the Korean war entered a new phase. From June 23 until the end of the year, the war in Korea was accompanied week by week by active discussions of termination of the strife. These discussions between representatives of the opposing forces began with a proposal by Jacob Malik, soviet spokesman in the United Nations, that both parties withdraw from the 38th parallel. On June 30 General Ridgway, on instruction of President Truman and upon recommendation of the national security council, broadcasted to "commander in chief of Communist forces" a proposal for a meeting to discuss an armistice. Negotiations began on July 10 at Kaesong, a town under Communist control. Two days later the talks were halted until the Communists might agree to neutralize Kaesong and admit United Nations correspondents to the town. By July 25 the agenda for discussion were completed, but on Aug. 5 the United Nations representatives broke off the talks for five days when Communist troops marched through Kaesong. On Aug. 23 the Communists broke off talks, charging that a United Nations plane had bombed their conference headquarters at Kaesong. On Oct. 25 after two months, the talks were resumed at Panmunjom, a village between the lines. By Nov. 27 a cease-fire line was settled and a 30-day deadline set for concluding an armistice. At this time a lull began on the battlefield. On Dec. 11 subcommittee talks on prisoners began, and a week later the Communists agreed to exchange prisoner lists. The deadline of the armistice, Dec. 27, yielded no progress in the armistice talks, the Communists indicating at this time that they might not supply some prisoner data that had been promised. (*See* also KOREAN WAR.)

America and War.—Naturally war as an instrument of national policy was the constant concern of the American people. Their eyes were fixed on Korea. By year's end U.S. casualties had exceeded 100,000. The steady flow of news as to the prospect of war in Europe gave much attention to the shipping of

"THE GREAT DEBATE," a cartoon by Pratt of the *Sacramento Bee* (Calif.), published in 1951

men and supplies to support the European allies. On June 19 President Truman signed a bill extending Selective Service to July 1, 1955, lowering the draft age to 18½ years, and lengthening service to two years. This was accepted as universal military service preliminary to the planned universal military training program. (*See* also SELECTIVE SERVICE, U.S.) A steady stream of rumors of soviet production of atom weapons increased public apprehension. Civil defense measures increased in importance and were pushed, particularly in some of the larger cities of the eastern United States. The constant possibility of the outbreak of war in the middle east, especially in Egypt and Iran, gave added weight to arguments for national protection.

Truman's Leadership.—The extent to which all domestic problems were embedded in the problems of international relations was evident in the utterances and actions of President Truman in the first six weeks of 1951. In the "state of the union" address on Jan. 8 he pointed out that the only realistic road to peace was to face the Soviet Union with force; the defense of Europe was the U.S. defense; and the Russians were fighting (in Korea) a civil war by proxy. Congress was to be asked for huge increases in taxes, the greatest portion of which was for military preparation (estimated at 69%). Universal military training was to be pushed. Four days later the president reported that cost of mobilization would probably be $140,000,000,000 by June 30, 1952. He later reiterated the need for an increased protection of civil rights of minorities.

It was apparent that the president would not have a party majority in support of his program. Although some emergency power had been granted him, the new congress (82nd) had, in the senate, elected Ernest W. McFarland (Dem., Ariz.) as leader, and in the house the southern Democrats, in coalition with Republicans, controlled the rules committee. But, as in the previous year, the president maintained his hold upon the party machinery in the house with a somewhat limited control in the senate. The final ratification of the 22nd amendment to the constitution in late February emphasized the possibility that President Truman would be a candidate for re-election, because he was definitely excluded from the operation of that two-term restriction.* He refused, however, to commit himself definitely. The lack of at least one powerful Democratic candidate, other than the president, was a striking feature of the Truman administration on the eve of the election year of 1952. The extent of southern revolt and the continuance of a southern protest vote were uncertain.

MacArthur's Leadership.—The U.S. public that had generally approved of Gen. Douglas MacArthur's regime in Japan from 1945 to 1950 became increasingly aware of his point of view on the far east as he continued to serve in 1951 as general in command of United Nations forces in Korea. Early in 1951 the utterances of General MacArthur were attracting unusual attention. In speaking of the formulation of a positive foreign policy, it was evident that he was speaking from the experience gained in five years as supreme commander in Japan. As the Korean war entered a new phase, his position not only on Korea but on Formosa became the subject of a violent attack. Recalled by President Truman on April 11, he appeared before congress and presented a program that had much to do with what had happened in the far east but was seen at once to be a program for the United States and Europe as well as Asia, and particularly for the United Nations. The wide acclaim with which he was received was an indication of the hold that he had upon the imagination of the people. His first speeches at receptions in various parts of the country were simply gracious thanks to his hosts, but beginning with his trip to Texas, followed by his appearance in Boston, Mass., in Cleveland, O., in Seattle, Wash., and before the American Legion at Miami, Fla., it was obvious that not only had General MacArthur a program in foreign affairs, but positive and definite views as to domestic problems involving the protection of free enterprise, limitations upon taxation, supremacy of the civil over the military. Nor did he overlook the increasing importance of the issue of corruption and graft in local, state and national government. His calls to the United States to resume its former place in the world and to give rebirth to the fundamental principles of the American heritage brought wide approval.

Treaty with Japan.—In Jan. 1951 John Foster Dulles was laying the groundwork for a treaty of peace with Japan. This preparation continued despite charges in the United Nations and elsewhere that it could not be carried to successful conclusion without the support of the U.S.S.R., which was not forthcoming, and without the inclusion of Communist China. After more than a year of negotiation among the powers other than Communist China, and the U.S.S.R. and its satellites, the United States took the lead in concluding a peace treaty with Japan, which was signed in San Francisco, Calif., on Sept. 8 by 49 nations, including Japan. (For text, *see* JAPANESE PEACE CONFERENCE.) A week before, the United States had signed defense pacts with Australia and New Zealand. On Sept. 8 also Japan and the United States agreed upon a bilateral security treaty which provided that U.S. troops could be stationed in Japan for an indefinite period.

Eisenhower's Leadership.—U.S. interest in Europe was symbolized by the leadership of Gen. Dwight D. Eisenhower. As supreme commander for the North Atlantic treaty nations he toured Europe early in the year and reported to the president and defense chiefs. In speaking to congress, he urged setting no limits on troops. Addressing the nation, he urged a wall of security against "Communist imperialism." Nevertheless, there was widespread disapproval of unlimited commitment of military aid to Europe. The concentration of national attention on the far east from April to August seemed to lessen the tensions prevalent in relations with Europe. These tensions were renewed in the autumn, partly as a result of the attempt by the Soviet Union to affect adversely the conclusion of the treaty of peace with Japan. The North Atlantic treaty nations met in Ottawa, Ont., in September and reiterated previous policies. General Eisenhower again visited the United States and reported to the president on his mission in Europe. Sharp national attention was given, late in the year, to the detainment of four United States fliers by the government of Hungary and the ransom demanded and paid. It was reported from London, late in December, that Great Britain would be associated with the proposed European army more closely than had been expected. Headquarters in the campaign to nominate General Eisenhower for president was opened in Washington, D.C., at this time, and speculation centred on the effect of developments in Europe upon the general's consent to become a candidate. (*See* also EUROPEAN RECOVERY PROGRAM; NORTH ATLANTIC TREATY ORGANIZATION.)

---

*The text of the 22nd amendment is as follows:

"No person shall be elected to the office of the President more than twice, and no person who has held the office of President, or acted as President, for more than two years of a term to which some other person was elected President, shall be elected to the office of President more than once. But this Article shall not apply to any person holding the office of President when this Article was proposed by the Congress, and shall not prevent any person who may be holding the office of President, or acting as President, during the term within which this Article becomes operative, from holding the office of President or acting as President during the remainder of such term."

First Session of the 82nd Congress.—Congress met for ten months with both senate and house of representatives under nominal Democratic party control. Actual power rested quite often, however, in the hands of an informal coalition of Republicans and southern Democrats. In more normal times this control might have led to a spirit of economy in governmental expenditures. With an undeclared war being waged in Korea and the threat of a global conflict hanging over it, however, congress allotted vast sums to satisfy the special needs of critical times. National defense appropriations totalled $56,940,000,000, "mutual security" gained $7,329,000,000 and $4,146,000,000 went to military construction. Despite these enormous sums, congress allocated $1,715,000,000 to the Federal Security agency, $6,163,000,000 in an Independent Offices act and $2,341,000,000 to the postal service. Multimillion-dollar appropriations went to other branches of the government. When flood disaster hit the lower Missouri valley, congress promptly allotted a total of $78,000,000 for the relief and rehabilitation of those affected.

Congress was in no mood to debate older domestic issues at length in 1951. Little civil rights legislation emerged from committees, and such long-range planning bills as those for the St. Lawrence waterway and a Missouri valley authority remained buried. Sharp tax increases were voted on both individual and corporation incomes, and the series E bond program was continued. Numerous bills provided for the real—and sometimes exaggerated—needs of veterans, and three were passed over presidential vetoes. Statehood for Hawaii and Alaska failed to come to a vote in the senate. "Socialized" medicine made little real headway, and bills calling for medical scholarships, aid to state and local governments to develop public health units, assistance to rural libraries and unemployment insurance for federal employees were not acted upon.

Despite the headlines given the Kefauver committee's hearings on organized crime, and even the wide publicity given the MacArthur hearings, the vital work of the 82nd congress in 1951 in the long view was its attention to the obligations of the United States in the world. The war with Germany was officially terminated, the provisions of the Displaced Persons act were extended to Dec. 31 and 24 destroyer escorts were transferred to six different countries. The president's power to negotiate reciprocal trade agreements was extended. Fourteen congressmen were authorized to participate in "public discussion of common problems" with representatives of the Consultative assembly of Europe.

Internal Security.—Late in January President Truman named a national committee to deal with the increasingly important subject of internal security. This was the Commission on Internal Security and Individual Rights, composed of outstanding citizens and headed by Adm. Chester Nimitz. It was hoped that by this means there would be erected an effective correction to movements and committees (some of extralegal character) that were proposing to deal with problems of loyalty. The hopes were short-lived, and late in the fall the commission disbanded. One of the government committees that continued the activities was the subcommittee of the senate judiciary committee, headed by Sen. Patrick McCarran (Dem., Nev.). This committee was particularly concerned with Communist infiltration of the press, educational institutions and labour unions. It held hearings throughout the year and was actively engaged at the year's end.

The state department in mid-January was planning a "reinvigorated offensive" against international communism by calling a conference of leaders of American thought. Apparently this was dropped. The "Voice of America" was under constant attack in the course of the year. As in the previous year, Secretary of State Dean Acheson and several of his subordinates in the state department were the object of violent attack. The loyalty review board headed by Hiram Bingham received from the president a new interpretation of its function and was active in review cases previously cleared. One of these, the case of John S. Service, came to public attention in the closing weeks of the year, and review led to his dismissal from the state department.

On June 4 the supreme court had affirmed the conviction of

SPECTATORS watching the Nevada state senate voting to ratify the 22nd amendment, bringing the number of ratifying states to the three-quarters necessary to add an amendment to the U.S. constitution. U.S. presidents were thereby limited to two elected terms, except the incumbent Pres. Harry S. Truman

11 Communists, and upheld the constitutionality of the Smith act. Later in the month, 21 Communist leaders in New York city were indicted. (*See* also Communism.)

Labour.—February was a month of acrimonious controversy. Although there was no declaration of strike on the part of railway unions, there was a widespread epidemic of "sickness" among union men that affected 17 eastern railways, hit traffic hard in 20 eastern cities and led to the charge that such "unofficial" action by the workers was directly interfering with national security. Mails were tied up and the National Mediation board seemed unable to deal with the situation. As the epidemic spread, both A.F. of L. and C.I.O. officials shifted the discussions to the charge that labour had been ignored in planning defense programs. Negotiations continued, and there was general denunciation of the "strikes." President Truman finally directed that the army be used to restore normal train service. The "strike" was broken when it became clear that those who did not return to work would face dismissal. As an aftermath, the Brotherhood of Railroad Trainmen was adjudged in contempt of court and later in the month, having pleaded guilty, was fined $75,000.

The A.F. of L. and C.I.O. were no nearer organic union at the end of the year than at its beginning, especially since few important changes in leadership took place at the top. At a time of national defense conversion with its accompanying rising prices, union leaders insisted that their voices were not being heeded by those guiding the nation's economy. To ensure greater future influence in Washington, union leaders placed major emphasis on preparations to ensure the election of additional political friends in 1952. In December there was a threat of a strike among steelworkers. (*See* also Labour Unions; Railroads; Strikes.)

Elections and Politics.—The westward shift of population reported in the census returns of 1950 meant that the far west would gain eight votes in the electoral college. This new distribution would be apparent in the assignment of delegates in national conventions of 1952. President Truman in a special message to congress on Jan. 9 listed seven states that would

Table I.—*Major Legislation Passed by U.S. Congress in 1951*

Act	House Vote	Senate Vote	Date of Enactment
Servicemen's Indemnity Act of 1951 (Authorized payment of free indemnity of $10,000 to survivors of members of armed forces who died on and after June 27, 1950)	Passed by voice vote (April 13)	Passed by voice vote (April 13)	Signed April 25
Extension of veterans' benefits (Extended World War II veterans' medical, hospital, burial and survivors' pension benefits to those serving in armed forces on and after June 27, 1950)	Passed by voice vote (May 10)	Passed by voice vote (May 10)	Signed May 11
India Emergency Food Aid Act of 1951 (Authorized loan of $190,000,000 to India for purchase of food grains or equivalent in the U.S.)	256–82 Yeas: D. 145, R. 110, Ind. 1 Nays: D. 31, R. 51 (June 6)	Passed by voice vote (June 11)	Signed June 15
Trade Agreements Extension Act of 1951 (Extended authority of president to enter into new foreign trade agreements until June 12, 1953)	Passed by voice vote (June 5)	Passed by voice vote (May 29)	Signed June 16
Universal Military Training and Service Act of 1951 (Extended Selective Service to July 1, 1955, requiring registration of all males at age 18, lowering induction age from 19 to 18½ and extending service from 21 to 24 months; provided for National Security Training commission to prepare and submit universal military training program to congress)	339–41 Yeas: D. 191, R. 147, Ind. 1 Nays: D. 9, R. 32 (June 7)	Passed by voice vote (June 1)	Signed June 19
Defense Production Act Amendments of 1951 (Extended Defense Production Act of 1950 to June 30, 1952, continuation of price and credit controls being authorized in somewhat weakened form; extended federal rent control to June 30, 1952).	294–80 Yeas: D. 180, R. 113, Ind. 1 Nays: D. 18, R. 62 (July 30)	Passed by voice vote (July 27)	Signed July 31
Defense Housing and Community Facilities Services Act of 1951 (Provided funds to make more housing and other facilities available in critical defense areas; authorized more liberal terms for financing low-cost housing)	Passed by voice vote (Aug. 21)	Passed by voice vote (Aug. 20)	Signed Sept. 1
Mutual Security Act of 1951 (Authorized omnibus appropriation of $7,483,400,000 in U.S. economic, military and technical aid to foreign nations in period July 1, 1951–June 30, 1952; created Mutual Security agency to supervise economic aid)	235 98 Yeas: D. 158, R. 76, Ind. 1 Nays: D. 20, R. 78 (Oct. 5)	Passed by voice vote (Oct. 8)	Signed Oct. 10
Department of defense appropriation act, 1952 (Appropriated $56,937,808,030 for U.S. armed services in period July 1, 1951–June 30, 1952)	Passed by voice vote (Oct. 5)	Passed by voice vote (Oct. 12)	Signed Oct. 18
Revenue Act of 1951 (Provided for an additional $5,691,000,000 in revenue by raising corporate and personal income tax rates and some excise tax rates)	185–160 Yeas: D. 147, R. 37, Ind. 1 Nays: D. 34, R. 126 (Oct. 19)	Passed by voice vote (Oct. 18)	Signed Oct. 20
Federal employees' salary increase (Provided for salary increases for most federal employees other than postal workers)	317–26 Yeas: D. 173, R. 143, Ind. 1 Nays: D. 6, R. 20 (Oct. 19)	Passed by voice vote (Oct. 19)	Signed Oct. 24
Postal workers' salary increase (Provided for salary increases for postal workers).	339 7 Yeas: D. 179, R. 160 Nays: D. 4, R. 3 (Oct. 19)	Passed by voice vote (Oct. 19)	Signed Oct. 24
Termination of state of war with Germany (Terminated state of war with Germany)	378 0 Yeas: D. 209, R. 169 Present: R. 1 (July 27)	Passed by voice vote (Oct. 18)	Signed Oct. 19
Mutual Defense Assistance Control Act of 1951 (Provided for control of U.S. aid to nations shipping strategic materials to Communist countries)	Passed by voice vote (Oct. 11)	55–16 Yeas: D. 37, R. 18 Nays: D. 0, R. 16 (Aug. 28)	Signed Oct. 26
Readjustment of postal rates (Increased postal cards to 2 cents, second-class rates 10% annually for 3 years; increased rates for special services and some third-class rates)	Passed by voice vote (Oct. 19)	Passed by voice vote (Oct. 19)	Signed Oct. 30
Atomic Energy Act of 1946 amendment (Authorized Atomic Energy commission to exchange nonweapon atomic energy information with friendly foreign nations, upon approval by national security council and the president)	Passed by voice vote (Oct. 16)	Passed by voice vote (Oct. 11)	Signed Oct. 30
Railroad Retirement Act amendments of 1951 (Provided for 15% increase in retirement benefits and 33% increase in survivors benefits; added benefit for spouses of retired workers)	339 0 Yeas: D. 178, R. 160, Ind. 1 (Oct. 19)	Passed by voice vote (Oct. 19)	Signed Oct. 30

“A REALLY ‘GREAT DEBATE,’ ” cartoon by Loring published in the *Providence Evening Bulletin* (R.I.) in 1951

gain congressmen (California seven, Florida two, Maryland one, Michigan one, Texas one, Virginia one and Washington one) and nine states that would lose (Pennsylvania three, Missouri two, New York two, Oklahoma two, Arkansas one, Illinois one, Kentucky one, Mississippi one and Tennessee one). Action in redistricting had by year's end been taken by California, Maryland, Michigan, New York, Illinois and others.

There were slight Republican gains in the by-elections of 1951. As the year ended, 18 states were controlled by the Republican party, and an equal number by the Democratic party. The 12 states of divided party control were Minnesota, Washington, Connecticut, Nevada, Utah, Massachusetts, Delaware, Colorado, New York, Wyoming, Montana and Maryland.

Sen. Robert A. Taft of Ohio was the first to enter the presidential race as a 1952 Republican presidential candidate, followed by Gov. Earl Warren of California and Harold Stassen, formerly governor of Minnesota and currently president of the University of Pennsylvania.

Three lines of attack upon the administration of President Truman developed during 1951. In the field of domestic politics it was opposition to the tax program; in foreign affairs it was opposition to policies in Europe and in Asia. Overshadowing these as the year ended was widespread condemnation of corruption in government. For the time being, division of opinion on labour relations, on loyalty checks and upon military expenditures did not follow party lines. Senator Taft took the leadership in condemning administration foreign policies, as he had earlier—and still did—administration domestic policies. His denunciation of the president was continuous and increased after he formally entered his candidacy for the presidency.

General MacArthur, still maintaining that he was not a candidate for office, continued to speak in condemnation of the administration. He gave verbal support to the candidacy of Taft in an address in Cleveland, O., in September.

The position of President Truman, particularly when attacked for protection of suspected Communists or for harbouring in government men accused of graft and corruption, was to denounce those Republicans who, he said, sought to destroy the trust and confidence of the people in their government by spreading fear and slander and lies. The president lost to Sen. Paul Douglas of Illinois on the appointment of judges in that state without the senator's approval, and the attempted appointment of Gen. Mark W. Clark as ambassador to the Vatican at the end of the first session of the 82nd congress aroused widespread protest from Protestant groups.

Throughout the year, Secretary Acheson bore the brunt of particular attack upon the Truman administration. Sen. Owen Brewster of Maine on June 5 accused Acheson of barefaced distortion of facts. At no time did the president desert him; indeed, he repeatedly defended Acheson by upholding his opinions and choice of subordinates, including the interim appointment of Philip Jessup as a member of the United States delegation to the United Nations after the senate subcommittee had failed to recommend him. (*See* also Democratic Party; Elections, U.S.; Republican Party.)

Social and Economic Trends.—Employment of women reached the highest point in history, passing early in 1951 the peak of World War II years. On the whole, wages increased and employment continued at high levels, but the rise of the cost of living more than kept up and there were dislocations of employment, not only because of war production changes but also because of falling production of less essential items.

A program of production, price and wage controls was attempted by the administration in late Jan. 1951. An attempt was made to freeze prices and wages, but failed almost at once because of modification and readjustment. Price ceilings were placed on 200,000 consumer items. By mid-June President Truman was impelled to say that controls would be necessary for a period of years to prevent inflation, and he urged also a strong anti-inflation bill; but congress refused to act.

In agriculture, the problem of surplus had disappeared because of demands in both domestic and foreign markets. Despite restrictions and costs, the building of homes reached an all-time high; yet federal housing projects were considerably fewer than in 1950. The military training program added more than 1,000,000 men in 1951, bringing the total number under arms to about 3,500,000.

A nation-wide survey at the end of 1951 revealed that 12,000,000 persons, or one-thirteenth of the nation, were receiving monthly income payments through governmental sources other than salaries as federal employees. Four per cent of the population, or 5,500,000, were needy persons getting public assistance. Yet the government was helping fewer needy persons than ten years before, and was spending less money for each needy person, even in view of the decreased purchasing power of the dollar. For, although those receiving benefits under the federal old-age and survivors insurance program had increased by 1,000,000, the transfer of thousands of needy persons from public assistance supported by general revenue to the social insurances meant that each person thus assisted had contributed toward his benefits. (*See* Birth Statistics; Census Data, U.S.; Death Statistics; Immigration and Emigration; also articles on the various states.) (E. E. R.)

Foreign Credits of the U.S. Government.—The indebtedness of foreign countries to the U.S. government increased by $152,000,000 in the 12 months ended Sept. 30, 1951. This raised the amount outstanding as a result of U.S. government lending programs since the creation of the Export-Import Bank of Washington (in 1934) to $10,126,000,000. Disbursements on loans and utilizations of other credits aggregated $432,000.000 in the 12-month period, while repayments of principal were $280,000,000. The net credit utilization was more than in the preceding 12 months since gross utilizations were slightly higher and repayments less than in the year ended Sept. 30, 1950. Foreign-credit utilizations over these two years had diminished considerably from the rates existing from V-J day through the first year of the European Recovery program, when the greater part of the indebtedness accumulated.

In proportion to gross foreign aid (grants and credits combined), credit aid declined to one-twelfth of the gross aid of $5,117,000,000 in the 12-month period. The transition from economic aid to military aid abroad, stimulated by the events

Table II.—*Foreign Credits of the U.S. Government—by Agency and by Country, Sept. 30, 1951*

	Total	Outstanding	Unutilized commitments
Total	*$11,124,975,818	$10,126,342,463	*$998,633,355

Total	$633,734,000
Army department	150,000,000
Economic Cooperation administration (Spanish loan)	16,668,000
Export-Import bank	467,066,000

Source: Clearing Office for Foreign Transactions, Department of Commerce.

in Korea during this period, was accompanied by a greater emphasis on grant aid rather than on loans and other credits. Furthermore, it was recognized that, in several instances, a virtual limit had been reached as to the amount which could be loaned to foreign countries with a reasonable expectation of repayment. (E. S. K.)

Education.—*See* the articles Education; Universities and Colleges.

Defense.—For information about the armed forces of the United States in 1951, *see* Armies of the World; Aviation, Military; Coast Guard, U.S.; Marine Corps, U.S.; National Guard; Navies of the World; Selective Service, U.S.

Foreign Trade.—*See* the articles Business Review; Export-Import Bank of Washington; International Bank for Reconstruction and Development; International Monetary Fund; International Trade; Tariffs.

Communications.—For statistics, *see* the articles Aviation, Civil; Canals and Inland Waterways; Electric Transportation; Motor Transportation; Post Office; Radio; Railroads; Roads and Highways; Shipbuilding; Shipping, Merchant Marine; Telegraphy; Telephone; Television.

Agriculture.—Statistical material pertaining to this subject may be found under Agriculture; also in separate articles on the principal crops and agricultural products.

Mineral Production.—*See* separate articles on the principal minerals; also Mineral and Metal Production and Prices. (X.)

URANIUM TEST PIT on the plateau bordering the Colorado river, an area being explored for the Atomic Energy commission in 1951. Four new uranium deposits were discovered during 1950–51

Uranium. A widespread search for new sources of uranium was still going on in 1951, and new deposits with workable concentrations were being mined. While no information had been made public on the actual output in any country, the Atomic Energy commission stated that the United States production of uranium exceeded that of Canada. Belgian Congo remained the largest producer, with the United States second and Canada third. The bulk of the U.S. output came from the Colorado plateau, an area of about 130,000 sq.mi. extending around the junction of the boundaries of Colorado, Utah, Arizona and New Mexico. In Canada the original discovery on Great Bear lake was supplemented by the Goldfields area on Lake Athabasca, where a custom mill was planned for ore treatment, and by developments in British Columbia. A prospective producing area was also discovered 50 mi. north of Sault Ste. Marie.

In Africa, besides the long-established Congo deposit, the enormous tailing piles of the Rand gold area were found to have a uranium content which, while extremely low, was amenable to economic recovery, because of the large tonnages of material already mined and crushed. A recovery plant was expected to be ready for operation sometime in 1952.

In the soviet area, uranium deposits were known in several sections of the Soviet Union, as well as the Joachimsthal region of Czechoslovakia and the Erzgebirge region of the German zone of occupation. Scanty available information did not indicate resources of any great extent, though presumably the deposits were being worked to the limit. (*See* also ATOMIC ENERGY.)

(G. A. Ro.)

Uruguay. A republic in southeastern South America, Uruguay is bounded on the north by Brazil; on the south by the Rio de la Plata; on the east by the Atlantic ocean and on the west by Argentina. It is the smallest country in South America, with an area of 72,172 sq.mi. It has a population of 2,365,000 (est. 1950), mostly of European extraction. Montevideo, the capital, has 850,000 inhabitants (1950 est.). Other leading cities are Paysandú (50,000), Salto (48,000), Mercedes (33,-

000), and Minas (32,000). Religion: Christian, mostly Roman Catholic. President in 1951: Andrés Martínez Trueba.

History.—On March 1, 1951, Andrés Martínez Trueba was inaugurated as president and Alfeo Brum as vice-president of Uruguay. In his inaugural address Martínez Trueba expressed solidarity with the western democracies and the desire of the new government to maintain its civil liberties. He welcomed refugee capital, but warned that he would take care that it did not disrupt the country's economy.

Martínez Trueba sponsored a constitutional reform, which was approved by the two leading political parties, to institute a form of executive in the government similar to the one in Switzerland. The nine-man federal council, charged with executive power, would be made up of six representatives from the majority party and three from the minority. This system had been in effect in Uruguay from 1919 to 1933, when it was abolished by Pres. Gabriel Terra. It was expected to become effective on March 1, 1952, with Martínez Trueba as the new head of the council.

Uruguay faced economic and financial difficulties during 1951. On June 30 the trade pact with Great Britain, regulating the price of meat, expired and was not renewed. Great Britain, however, negotiated a pact with Argentina, which was reassuring to Uruguay, since similar conditions usually prevail for both countries. The export trade in wool was booming in view of the demand for it in the United States. A strike in the national administration of fuel, alcohol and cement extended to other sections of the country's economy, tying up transportation and closing newspapers and theatres. It was settled, however, when some of labour's demands were met. (J. McAd.)

Education.—In 1950 there were 546 urban schools with 157,033 pupils and 1,176 rural schools with 55,476 pupils. The total number of teachers was 6,744. There were also 191 private schools with 36,884 pupils. The University of Montevideo had 11,948 students. In 1950, 25,457,117 pesos were allocated for primary education and 7,047,140 pesos for the university.

Finance.—The monetary unit is the peso, valued at $0.5263 U.S. currency, controlled rate; $0.4082, commercial free rate: and $0.4149, uncontrolled rate, on Oct. 31, 1951. Actual government expenditures in the year 1950 were 306,000,000 pesos; revenue, 280,000,000 pesos. The internal public debt was 779,504,000 pesos on June 30, 1951; external, 115,526,000 pesos. Currency in circulation at the end of Oct. 1951 amounted to 297,000,000 pesos; demand deposits, 423,700,000 pesos; gold reserves $242,000,000. The cost-of-living index for Montevideo stood at 207 in July 1951 (1937=100).

Trade and Communications.—Exports in 1950 totalled $254,281,366; imports, $201,694,860. Chief exports were wool (60%), beef and mutton (14%) and hides, skins and leather (11%); leading imports, raw materials (28%), machinery and vehicles (27%) and building materials (9%). Leading customers were the U.S. (51%), the United Kingdom (13%) and Belgium and France (each 6%); leading suppliers, the United Kingdom (22%), the U.S. (20%), Brazil (9%) and France (7%).

Railways (1948) totalled 1,874 mi.; in 1950 they carried 9,211,000 passengers and 2,091,930 short tons of freight. Highways (1948) totalled 26,000 mi. of which 3,051 mi. were paved national roads. On Dec. 31, 1949, there were 56,500 automobiles and 20,000 trucks. According to *Lloyd's Register of Shipping*, the merchant marine had 47 steamers and motor ships (100 tons and over) aggregating 84,607 gross tons on June 30, 1950. In 1950, 2,072 ships with net tonnage of 9,241,136 entered the port of Montevideo.

Agriculture.—Official production estimates for major crops in the crop year 1950–51 (in short tons) included wheat 479,202; linseed 99,210; oats 37,658; malt barley 15,669; ordinary barley 11,486.

Official estimates (1949) showed 8,700,000 cattle and 23,000,000 sheep. Wool exports in the wool year 1950–51 (Oct. 1–Sept. 30) were 154,006 bales, of which 118,492 bales went to the U.S., 9,735 bales to Belgium and 5,278 bales to France. Meat exports in 1950 included 68,815 short tons of frozen beef, 23,861 tons of canned beef and 14.482 tons of frozen mutton.

Manufactures.—Production figures in 1950 included automobile and truck tires 60,000, beer 36,300,000 litres, wine 70,000,000 litres, rayon woven goods 3,550,000 lb. and paper 28,600 short tons. There were four *frigorificos* for treating meat, eight *saladeros* and seven meat-canning plants in 1951. (J. W. Mw.)

U.S.S.R.: *see* Union of Soviet Socialist Republics.

Utah. A Rocky mountain state, admitted to the union in 1896, Utah is popularly known as the "Beehive state." Area: 84,916 sq.mi. (82,346 sq.mi. land; 2,570 sq.mi. water); pop. (U.S. census 1950): 688,862, an increase of 25.2% since 1940. Of this number urban population amounted to 499,855 and rural population, 239,007. There were 676,909 white persons and 11,953 nonwhites. Capital: Salt Lake City (1950 census) 182,121. Other principal cities with final 1950 census figures were Ogden, 57,112; Provo, 28,937; Logan 16,832.

History.—The chief officers of Utah in 1951 were J. Bracken Lee, governor; Heber Bennion, Jr., secretary of state; Reese M. Reese, auditor; Ferrell H. Adams, treasurer; Clinton D. Vernon, attorney general; E. Allen Bateman, superintendent of public instruction.

The chief political issue of 1951 was the continued economy drive of Republican Gov. J. Bracken Lee which was countered with resistance on the part of the Democrat-dominated legislature, meeting in a special session. The split between Governor Lee and the other chief officers of the state, all of whom were Democrats, was broadened when a feud broke out between Superintendent of Public Instruction E. Allen Bateman and the governor, culminating in the latter's opposition to the raising of Bateman's salary from $6,000 to $10,000.

Riots and year-long turbulence at the state prison seemed headed for settlement by the end of the year when Marsell Graham, formerly with the Federal Bureau of Investigation, was named permanent warden of the institution.

Education.—In 1951, full-time students enrolled in the public schools of Utah numbered 156,677, which marked an increase of 3,292 over the 1950 figure and which constituted a 17.5% increase over the 133,791 students enrolled in 1941. By the end of 1951, the state department of public instruction announced that 88.9% of the 5,960 public school teachers in the state had qualified under the new certification law.

Social Insurance and Assistance, Public Welfare and Related Programs.—Total expenditures for public assistance during the fiscal year July 1950 to June 1951 amounted to $11,879,641.01 (for 26,285 persons), slightly more than a 1% increase from the previous year. The funds were distributed as follows: old-age assistance $5,529,393.56 (10,318 persons); aid to dependent children $3,709,889.94 (11,564 persons); aid to the blind $126,398.02 (237 persons); aid to the disabled $738,235.44 (1,721 persons); aid to unemployables $518,539.48 (999 persons); aid to employables $228,675.90 (917 persons); foster care $271,111.30; institutional care $41,599.73; sight conservation $5,987.11; welfare services $128,027.06; and administration $581,783.47.

For the biennial period ending June 30, 1950, the state reported on its four welfare institutions as follows: Utah state industrial school at Ogden—expenditures of $191,201.97 for fiscal year ending June 1950 for average daily population of 153 persons with a cost per student day of $3.42; Utah state training school at American Fork—expenditures of $402,653.21 for fiscal year ending June 1950 for 1,259 persons; Utah state tuberculosis sanatorium—expenditures of $309,133.54 for biennium, July 1948 to June 1950, for 69 patients admitted for observation and treatment; Utah state hospital at Provo—expenditures of $784,547.19 for fiscal year ending June 1950 for 1,447 patients.

At Utah state prison an all-time high population was reached in Feb. 1951, when 578 inmates were housed in the new prison. By the end of the year the figure had dropped to 472.

Communications.—On Dec. 1, 1951, there was a total of 30,189.5 mi. of road in the state, including the following: state road system, 572.3 mi.; county road system, 16.107.1 mi.; town and city streets, 2,917.7 mi.; federal road system, 5,715.3 mi. Total expenditures on highways for the fiscal year ending June 30, 1951, amounted to $13,785,945.15 of which $2,590,667.12 was spent for maintenance, $2,342,648.64 for state construction costs and $7,224,923.28 for federal construction costs. Motor vehicle registration reached 298,564 vehicles by Dec. 1, 1951, including 237,796 passenger cars. As of Jan. 1, 1952, operating railroads had a combined mileage of 1,977.22 mi.

Banking and Finance.—The 43 state banks had total assets of $323,510,636.63 as of Oct. 10, 1951. On that date the 11 national banks reported total assets of $341,506,360.26. There were 13 state-chartered savings and loan associations with total assets of $55,146,479.31 as reported Dec. 30, 1950.

State receipts for the fiscal year ending June 30, 1951, were $89,679,978.82; disbursements for the same period amounted to $86,782,876.45. The total state debt on June 30, 1951, was $620,000 which would be completely amortized by March 1, 1955, as a result of a bond retirement fund created by the 1943 legislature.

Table I.—*Principal Agricultural Products of Utah*

Crop	1951	1950	Average, 1940–49
Wheat, bu.	9,081,000	7,840,000	6,937,000
Barley, bu.	6,072,000	6,204,000	5,420,000
Oats, bu.	1,886,000	2,340,000	1,957,000
Corn, bu.	1,147,000	1,080,000	756,000
Potatoes, bu.	2,316,000	3,308,000	2,801,000
Sugar beets, tons	413,000	535,000	517,000
Hay (all), tons	1,023,000	1,020,000	1,165,000
Apples, bu.	493,000	282,000	459,000
Peaches, bu.	983,000	130,000	763,000
Cherries, tons	6,400	1,230	5,830
Tomatoes (processing), tons	99,600	61,100	. . .

Source: U.S. Department of Agriculture.

Agriculture.—The total crop value for Utah in 1951, exclusive of livestock and livestock products, amounted to $87,118,000 or 23% above the revised value of 1950 crops and 16% above 1949. Cash receipts from marketings during 1950 had amounted to $104,193,000 for livestock products and $43,013,000 for crops or a total of $147,206,000.

Preliminary figures for 1951 reported 560,000 head of cattle (112,000 milk animals), 71,000 hogs and 1,438,000 sheep and lambs.

Manufacturing.—The total income for Utah in 1950 amounted to $883,000,000, an increase of $58,000,000 over that of the previous year.

(B. D. M.)

Table II.—*Principal Industries of Utah*

Industry	Av. workers per month	Total wages 1950
Wholesale and retail trade	43,874	$113,338,722

Vandenberg, Hoyt Sanford (1899–), U.S. air force chief of staff, was born on Jan. 24 in Milwaukee, Wis. He graduated from the U.S. Military academy at West Point, N.Y., in 1923 and served in various capacities in the U.S. until May 1929 when he went to Schofield Barracks, Hawaii, to join the 6th pursuit squadron, of which he assumed command in Nov. 1929. He next served as flying instructor at Randolph Air Force base, Texas, becoming a deputy stage commander in March 1933. He became an instructor at the Air Corps Tactical school and in Sept. 1938 entered the Army War college, being graduated in June 1939. He next served in the plans division of the office of the chief of the air corps in Washington, D.C., and became operations and training officer of the air staff in Washington after the U.S. entered World War II. In June 1942 he was assigned to the United Kingdom, and helped plan the air participation in the North African campaign. On Feb. 18, 1943, he became chief of staff of the northwest African strategic air force. Returning to the U.S. in Aug. 1943, he was deputy chief of air staff, and in 1944 commanded the U.S. air component in the Allied expeditionary force, assuming command of the 9th air force in Aug. 1944. He was named chief of staff of the air force on April 30, 1948.

On Feb. 19, 1951, he agreed in testimony before a senate committee that air and sea forces alone could not prevent soviet forces from overrunning Europe. He testified on May 28–29 that Gen. Douglas MacArthur was wrong in thinking China could be bombed out of the war. On Aug. 24 he announced that the U.S. air force had been given a new mission, that of using atomic weapons directly against ground troops.

Van Fleet, James Alward (1892–), U.S. general, was born on March 19 in Coytesville, N.J. He studied at the Summerlin institute in Bartow, Fla., attended the U.S. Military academy and was graduated in 1915. He saw action in France during World War I, served with U.S. occupation forces, and was assigned to a series of military education posts during the 1920s and early 1930s. As the pre-World War II defense program expanded, he was named commanding officer of the 8th infantry regiment of the 4th division, and he eventually led this regiment in the invasion of Normandy. He commanded the 4th infantry division in operations against the Siegfried line; the 90th division in crossing the Moselle and the 3rd corps in the advance into Germany.

On Feb. 6, 1948, Pres. Harry S. Truman named him to direct the U.S. military groups on duty in Greece, where he had much to do with the eventual ousting of the Communist guerrilla forces. On April 11, 1951, he was appointed to succeed Gen. Matthew B. Ridgway as U.S. 8th army commander in Korea, in the reshuffling of commands that followed the removal of Gen. Douglas MacArthur. He was named a four-star general by President Truman on July 9, 1951.

Varnishes: *see* Paints and Varnishes.

Vatican City State. This sovereign independent state was established by the Lateran treaty between the Holy See and the Italian government on Feb. 11, 1929. The treaty was recognized in international law, with the reigning pope as sovereign. The area of Vatican City is 108.7 ac., excluding the papal estate of Castel Gandolfo and certain basilicas in Rome which are extraterritorial. Executive powers are exercised by the governor, responsible to the pope.

The Vatican sent 58 representatives, including nuncios, internuncios, apostolic delegates and other representatives, to other countries. Diplomatic representatives were assigned to the Vatican by 39 countries.

The Sacred Consistorial Congregation issued decrees excommunicating all those in Rumania and Czechoslovakia who took part in any way in the arrests of Msgr. Augustin Pacha, bishop of Timisoara in Rumania, and Archbishop Josef Beran of Prague, Czech.

In December a committee of archaeologists and scholars delivered to Pope Pius XII an objective and scientific report that Peter, the first pope, was buried in Rome. The proofs contradicted arguments advanced by those who said St. Peter had never been in Rome and did not establish his see there, or suffer martyrdom on the Vatican hill.

In June the Sacred Roman Rota, the Vatican tribunal, reported that it had decided 151 applications for marriage annulments from all over the world during 1950. Annulments were granted in 37 cases; 50 cases were heard free of charge by reason of the poverty of the clients.

The Italian government granted the Holy See rights over 1,325 ac. of land on the outskirts of Rome for the erection of new Vatican radio transmitters. Vatican City could not accommodate the transmitters, which were to be strong enough to carry broadcasts in dozens of languages to every part of the globe.

The assessor of the Holy Office, Msgr. Alfred Ottaviani, in an article in *Osservatore Romano*, warned the faithful about interest in alleged supernatural events. It is the duty of the magisterium of the Church to judge the facts concerning such events and alleged revelations of divine origin, and it is the duty of the Church's good children to submit to this judgment, the monsignor said.

The Sacred College of Cardinals was reduced to 49 members by the deaths of Francesco Cardinal Marchetti-Selvaggiani, Dennis Cardinal Dougherty and Adam Stefan Cardinal Sapieha. This left 21 vacancies. (*See* also PIUS XII; ROMAN CATHOLIC CHURCH.) (J. LAF.)

Vegetable Oils and Animal Fats.

The U.S. 1951 production of fats and oils, including the oil equivalent of exported seeds, was forecast for the year beginning Oct. 1951 at new high record levels of about 12,750,000,000 lb., substantially more than the 1950 record and nearly half again as much as the pre-World War II level. In spite of a large supply, it was indicated that civilian per capita consumption would average only 43.2 lb. of edible fats and oils in 1951, 5% less than in 1950 and 3% below the pre-World War II rate.

The largest outturn of oil seeds, 16,345,000 tons, was produced in 1951; the 281,000,000 bu. of soybeans made up more than half the total; cottonseed tonnage was about 50% more than in 1950 and one-fourth above average; peanuts, 1,595,000,000 lb., were one-fifth below either 1950 or average; flaxseed was one-sixth less than in 1950 and 9% below average. Butter production declined by about 45,000,000 lb.; its civilian consumption per capita averaged only 9.7 lb., 90% of 1950 and 58% of pre-World War II consumption. Lard and rendered pork fat production increased by more than 100,000,000 lb. since there was an increased hog kill; civilian consumption per capita in food increased to 12.5 lb., 2% more than in 1950 and 14% higher than the pre-World War II rate.

Margarine used in 1951 was preliminarily estimated at more than 1,000,000,000 lb., a new record, about 6.7 lb. per capita, 10% more than in 1950 and 231% higher than the pre-World War II rate. Further increase in use was predicted for 1952. In 1951 eight more states repealed the prohibition against coloured margarine; as of Sept. 1 its manufacture and sale was still prohibited in eight states.

Soap fats and oils also showed some increase for the year, whereas drying oils, abundant in 1950, were less abundant in 1951. In part this latter situation was related to a small linseed crop, but good amounts of these nonedible oils were included in imports which in 1950–51 totalled 608,426,000 lb., valued at $132,168,000, compared with 410,517,000 lb., valued at $78,721,000, in the preceding year.

*U.S. Production of Principal Fats and Oils**

(In millions of pounds)

	1951†	1950	Average, 1937–41
Butter	1,460	1,505	2,220

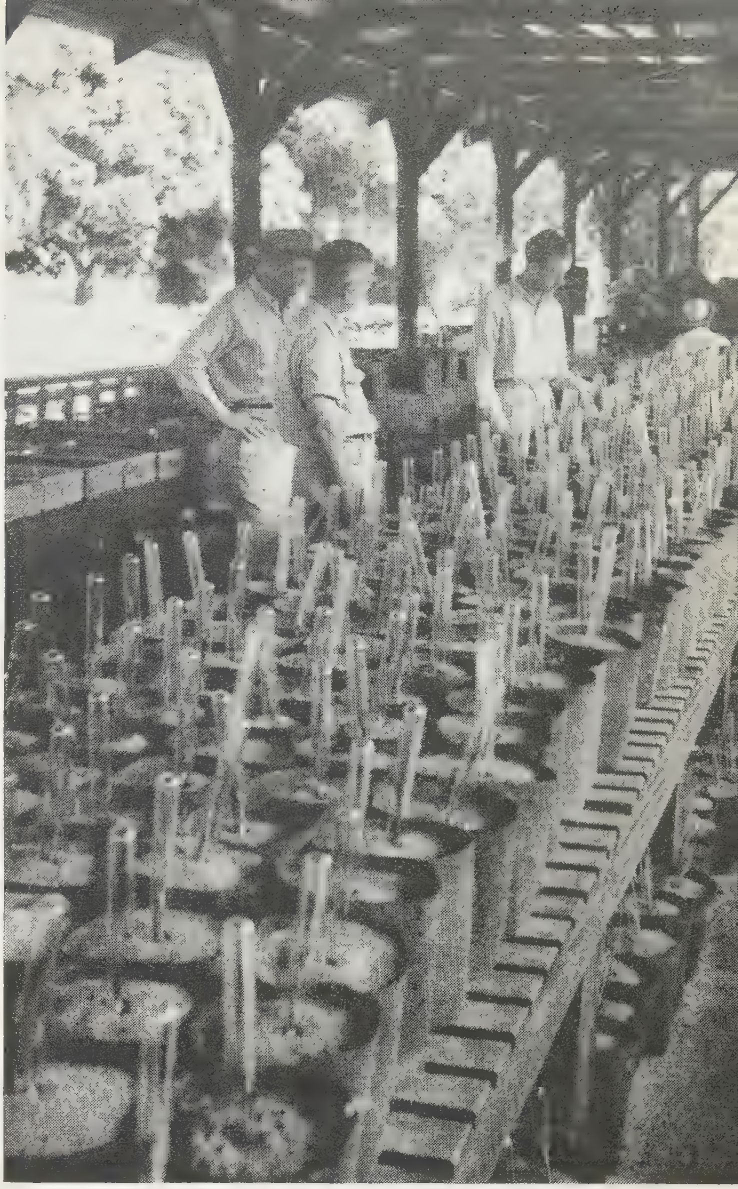
Other oils	25	19	21
Totals	12,750	12,308	8,696

*Year beginning October.
†Partly forecast.



AFRICAN OIL PALM SEEDLINGS being grown in 1951 in a laboratory of the United Fruit company in Honduras, where palm oil was put in production for the first time in the western hemisphere

Of the 8,562,000,000 lb. of edible fats and oils, including butter, distributed in 1950–51, 12.3% or 1,054,000,000 lb. were exported—somewhat less than the record 1,147,000,000 lb. of the previous year. Of that amount about two-thirds, or 638,000,000 lb., went to Europe, 452,000,000 lb. to countries participating in the European Recovery Program. Latin-American republics received 259,000,000 lb. On a crop year basis, the 11 months from Oct. 1950 through Aug. 1951 evidenced a high level of export—2,173,000,000 lb., compared with 1,895,000,000 lb. a year earlier; included were 584,000,000 lb. of lard, 698,000,000 lb. of soybean oil and oil equivalents in soybeans and 457,000,000 lb. of inedible tallow and grease. Items which contributed substantially to the total were 85,000,000 lb. of fat in emergency aid to Yugoslavia, record large exports of soybean oil to Spain following the poor olive crop of 1950 and large shipments of soybeans to Japan, which normally would draw on Manchurian supplies.

Vegetable oils and lard in 1951 dropped about 30% in price after the early months of the year.

The over-all world fats and oils supply-demand situation appeared to be in better balance at the end of 1951 than at any time since World War II. Olive oil production in the principal producing countries of the Mediterranean basin was expected to be the largest in years, possibly an all-time high of 1,461,600 tons, compared with only 597,100 tons in 1950 and an average for the early 1940s of 854,300 tons. Copra shipments from the Philippines continued large. Argentina's surpluses of oilseed, particularly of linseed, were mostly exhausted. The West African and Indian peanut crops were large. Supplies of coconut and palm oils, which are used to some extent in Europe for food, were expected to be up considerably. (*See* also COTTON; PEANUTS; SOYBEANS.) (J. K. R.)

Vegetables. U.S. production in 1951 of commercial truck crops, based on 25 vegetables and not including strictly market garden areas or farm gardens, was 6% less than in 1950 but 11% higher than the 1940–49 average. Fresh vegetable prices at the producer level were exempted from the provisions of the general price freeze order of Jan. 26, 1951; the value of the 1951 crop was estimated at 18% more than the large one of 1950. The higher price trend was reinforced in November by freeze damage to some of the crops, and in December the index of prices to truck farmers was 33% higher than in November and 57% higher than in Dec. 1950.

It appeared that Cuban and Mexican winter vegetables would be available to the U.S. market in large amounts. U.S. fresh vegetable exports reached an all-time record high of 508,000,000 lb. in 1950, of which 80% went to Canada.

An abundant and valuable 1951 crop of 11 vegetables for commercial processing reached, in total, a new tonnage record, exceeding the 1950 crop by about 20%.

Record high yields were established for lima beans, peas and tomatoes. The crop was valued at $318,000,000, 27% above the previous (1946) record, and 78% above the 1940–49 average. Canned vegetables available to civilians, 41.5 lb. per capita, approximated the 1950 level but were 39% more than the pre-World War II rate; frozen vegetables, 3.5 lb. per person, were increased 6% over 1950.

In total, these U.S. fresh vegetable crops, whether sold as truck or for commercial processing, were estimated to have returned $970,950,000 to their producers, compared with $760,085,000 in 1950 and $674,856,000 average for 1940–49. California was the leading producer with a production valued at $323,680,000, Florida was second ($115,700,000) and New York third ($64,062,000).

Production in 1951 of dried edible beans and peas was large both in the U.S. and the world. The U.S. government filed an antitrust suit against California's Salinas valley lettuce growers and obtained an injunction to stop them from destroying part of the crop to keep prices up.

Commercial Truck Crops for the Fresh Market.—A total of 8,572,300 tons of 25 crops was produced for the fresh market in 1951 and returned a value of $653,184,000; comparable figures for 1950 were 9,072,800 tons valued at $553,008,000, and for 1940–49 an average of 7,717,000 tons worth $496,282,000.

Compared with 1950, production in 1951 was higher for 10 crops and lower for 14, with cabbage, onions and lettuce showing the largest tonnage decreases, celery the largest increase. Tomatoes were the most valuable ($115,475,000); lettuce was second ($111,157,000). California with 2,629,700 tons from 347,020 ac. valued at $230,009,000 was indisputably in first place; Florida produced 1,158,000 tons having a value of $112,764,000 from 244,100 ac.

Table I.—*U.S. Vegetable Production for Fresh Market*

Commercial Truck Crops for Processing.—The U.S. 1951 crop of 11 vegetables for commercial processing was a record 7,505,600 tons, grown on 1,880,500 ac. and valued at $317,766,000. Comparable figures for 1950 were 5,303,000 tons from 1,622,630 ac. with a value of $207,077,000. For 1940–49 the average was 5,378,000 tons valued at $178,574,000 and grown on 1,830,830 ac. Tomatoes were the leading crop in value ($144,364,000). California was the leading producer ($93,671,000) and Wisconsin was next ($25,822,000).

Table II.—*U.S. Production of 11 Vegetables for Processing*

(In tons)

Crop	1951	1950	Average 1940–49
Asparagus	110,300	107,200	87,400
Beans, lima	93,600	80,500	45,500
Beans snap	273,100	257,200	201,200

Pimientos	15,300	45,000	13,400
Spinach	111,400	74,300	84,300
Tomatoes	4,584,900	2,733,900	2,883,400

The U.S. crop of dry edible beans for 1951 was estimated at 16,000,000 bags (100 lb. each, cleaned basis), about 6% more than the previous year but moderately less than the average for 1940–49. A harvested acreage of 1,417,000, 6% less than in 1950, was more than compensated for by the highest yield on record, 1,231 lb. per acre, compared with 1,117 lb. in 1950 and an average of 958 lb. for 1940–49.

California was the leading producer, 4,709,000 bags, though Michigan, with a record yield per acre, produced 4,022,000 bags. The pinto bean, largely produced in the southwest, where drought damage was widespread in 1951, dropped to second place among the classes, with 3,033,000 bags (3,650,000 in 1950), whereas the pea bean was first with 4,060,000 bags, compared with only 3,356,000 bags in 1950.

Prices were favourable at $7.78 per bag, estimated season average price to farmers, compared with $7.37 per bag in 1950. Exports of more than 228,000,000 lb. in 1950–51 were nearly three times as large in quantity and double the value of the previous year.

Production of beans in 50 countries was estimated at 117,000,000 bags for the 1951–52 season, 4% more than the previous year and 10% larger than the pre-World War II or wartime average.

U.S. consumption of dried field peas was about the same in 1951 as in 1950, but 17% above the prewar level. The 1951 crop was a large one, 3,478,000 bags (18% more than in 1950), harvested from 290,000 ac., 24% more than in 1950, with an average yield of 1,298 lb. per acre (1,376 lb. in 1950). Washington and Idaho accounted for 92% of the total. (*See* also Corn; Horticulture; Potatoes.) (J. K. R.)

Venereal Diseases. Less syphilis was reported in the United States in 1951 than in any previous year since 1929 and less gonorrhoea than in any year since 1942. Public clinics—about 2,200 of them—and other treatment centres assured that diagnosis and treatment were available to all people. There were diagnostic serum tests of improved stability and sensitivity. Under investigation was one procedure, the treponemal immobilization test, which might strengthen the laboratory diagnosis of syphilis.

Performance of serologic tests over the nation was creditable, as an evaluation of state serologic laboratories demonstrated. Results of this survey indicated a universal willingness not only to adopt improved tests as they are developed but also to strive for better performance.

The U.S. public health service's estimated U.S. annual minimum incidence of syphilis in the civilian population only was as follows: in 1947, 214,000 cases; in 1948, 178,000 cases; in 1949, 139,000 cases; in 1950, 98,000 cases; and in 1951, 71,000 cases.

Health departments, emphasizing case finding in 1951, were aided in their public appeal, mass testing and contact tracing programs by the public health service. Fifty-eight case-finding projects in 34 states received assistance in the form of funds, services and supplies. The increased emphasis being placed on outpatient treatment of venereal disease meant that less time was available for interviewing patients to learn the identity of their contacts. As a result, intensive training in contact tracing and wide use of all methods of case finding had become necessary.

Venereal disease control officers sought in 1951 to gear their programs to the needs of the national defense effort. Because periods of mobilization had traditionally brought increases in venereal disease rates, these officers took steps to strengthen case-finding measures in defense areas where increases were likely to occur first. Especially important were efforts to continue and improve co-operative procedures between the civilian and military control programs. As a result, state health departments assigned civilian case-finding specialists to military installations where such services were requested by post commandants.

A uniform system of reporting case-finding activities was developed, and case-finding personnel of the armed forces were being trained in public health service centres.

Research in venereal disease went ahead in the three research centres of the division of venereal disease, at Chamblee, Ga., Hot Springs, Ark., and Chapel Hill, N.C. Among the problems under study were immunity in syphilis; the artificial cultivation of the organism which causes syphilis, *Treponema pallidum;* and certain variations in response of the organism, syphilis therapy and in host reactions. Much work was in progress on the treponemal immobilization test and on standardization of serologic tests, so that the diagnosis of syphilis through blood tests could be more specific and simplified.

The laboratory at Chamblee, Ga. had as one of its basic functions the maintenance of standards of serologic work in state and local laboratories. In 1951 it continued to supply antigens to these laboratories and evaluated their serologic procedures. It also provided serologic analysis for the approximately 14,000 blood specimens obtained in the Virgin Islands and the 228,000 specimens tested in the Atlanta, Ga., health screening program.

Clinics and rapid treatment centres, state and locally operated, remained the heart of the national venereal disease control program in 1951. Their records reflected the vigour with which health departments were proceeding against venereal disease. Diagnostic observations completed by clinics, numbering more than 2,400,000 observations, resulted in the admission to the clinics for treatment of more than 388,000 cases of venereal disease. Staff members of these centres made about 450,000 investigations to find cases of venereal disease and bring them to treatment.

Admissions to venereal disease inpatient centres numbered 110,000 in 1951, a decline of about 17% from the previous year's record. The average stay for all admissions to all centres was 7.5 days, and for syphilis admissions, 8.9 days. The average cost per patient day was $5.86.

Installations and personnel of the division of venereal disease rendered consultative and teaching services in 1951. The venereal disease research laboratory received 280 trainees for instructions and consultation in laboratory procedures and problems.

The medical centre at Hot Springs, Ark., conducted a variety of orientation and instructional programs for public health workers, hospital nurses and private physicians.

Declines in morbidity reporting and in mental disability and deaths from syphilis amply demonstrated the striking progress in venereal disease control during the decade 1941–51. However, it was estimated that there were 3,000,000 persons in the United States in 1951 who would have positive serologies for syphilis if the entire population were blood tested. Actual reports from the states showed more than 198,000 cases of syphilis among civilians in 1951—more than 18,000 in the early infectious stages, about 52,000 in the early latent stage and more than 107,000 in the later stages. In addition, more than 12,000 cases of congenital syphilis were reported. Gonorrhoea was still reported in hundreds of thousands of cases—more than 270,000 in 1951.

Venereal disease control was still faced with many unsolved problems: (1) the biology of the spirochaete and of immunization for syphilis; (2) lack of specificity of laboratory procedures; (3) care and prevention of late symptomatic syphilis; (4) application of technical knowledge and operational skills in case finding to all areas needing assistance; (5) final evaluation of penicillin therapy; and (6) relative lack of response of gonorrhoea incidence and prevalence to any control procedures yet applied.

See Federal Security Agency, *Annual Report* (1951). (T. J. B.)

Venezuela. A federal republic of 20 states, 2 territories, a federal district and various small islands (population 779) known as federal dependencies, on the north coast of South America, with an area of 352,143 sq.mi., population (census of Nov. 1950) 4,986,000, not including indigenous tribes not living in towns; Caracas, the federal capital, with 487,000 (662,000 in its metropolitan area); Maracaibo, 232,000; Barquisimeto, 105,000; Valencia, 88,000; Maracay, 66,000; San Cristóbal, 56,000; Cumaná, 46,000; Puerto Cabello, 34,000; Ciudad Bolívar, 36,000; Puerto La Cruz, 28,000. Throughout 1951 the governing junta continued as constituted on Nov. 27, 1950, of Germán Suárez Flámerich, president; and Col. Marcos Pérez Jiménez and Col. Luis Llovera Páez, members, with Pedro Moreno, secretary.

History.—The year was one of reasonably full employment but economic activity slowed down somewhat except in the mining and petroleum industries. The average daily petroleum production exceeded 1,700,000 bbl. The first cargo of iron ore was shipped by the Bethlehem Steel company to Baltimore, Md., early in 1951. Building of major highways, urban and statewide, and many schools, hospitals and other public structures continued through the year; and the expansion of the capital continued to sustain land values and speculative building.

The First National Petroleum convention met in Caracas Sept. 9–18, under the presidency of Santiago E. Vera, minister of mines and petroleum. It was attended by cabinet officers and functionaries of virtually all petroleum-producing countries in the world, except the U.S.S.R. and areas it controlled, and by representatives of virtually all private oil-producing enterprises in the world. Late in 1951 steps were taken toward the revision of the trade treaty between the United States and Venezuela, but no decisive action had occurred before the end of the year.

Late in December announcement was made that the source of the Orinoco had at last been located by an official expedition.

Sporadic disorders occurred late in the year in several areas. The universities were closed in consequence of continued controversy between the ministry of education and the faculties on the subject of official intervention; student rioting also had some part in bringing about the cessation of classes. Toward the end of the year, a movement to establish a nonofficial university in the capital was begun. (C. Me.)

Education.—In Oct. 1949 there were more than 5,300 primary schools with 464,697 pupils enrolled. In April 1951 secondary and special schools, public and private, numbered 151 with 24,925 students and 1,869 teachers; the 31 normal schools had 2,860 students and 342 teachers. In 1950–51 the Central university had 4,747 students matriculated, Los Andes 866, Zulia 840 and the Instituto Padagógico 448. Education was allotted 7.3% of the 1951–52 budget.

Finance.—The monetary unit is the bolívar, valued at $0.2985 U.S. currency, controlled and free selling rates, during 1951. Actual government expenditure in the fiscal year ending June 30, 1951, was 2,134,000,000 bolívares; revenue, 2,112,000,000 bolívares. The 1951–52 budget was balanced at 1,951,000,000 bolívares; it had been raised to 1,979,643,000 bolívares by Oct. 31, 1951. The treasury balance was only 145,000,000 bolívares on Sept. 30, 1951. There was no external debt; the internal debt was reported to be 14,700,000 bolívares on Oct. 31, 1951. Currency in circulation (Sept. 30, 1951) was 722,000,000 bolívares; demand deposits 745,000,000 bolívares; gold reserves $373,000,000; foreign exchange reserves $6,000,000; dollar exchange in U.S. banks $76,000,000. The retail food price index (Caracas) stood at 332 in Sept. 1951 (1937=100).

Trade and Communications.—Exports in 1950 totalled 3,888,454,877 bolívares; imports 1,798,417,935 bolívares. Chief exports were crude petroleum and petroleum products (97%), coffee (1%) and cacao (1%); leading imports, machinery and equipment (29%), foodstuffs and beverages (21%) and metals and manufactures (13%). Leading suppliers were the U.S. (68%), the United Kingdom (7%), Canada (4%) and Germany (3%); leading customers, the Netherlands Antilles and the U.S.

Railways (1950) totalled 700 mi.; highways, 3,750 mi. of all-weather roads and 1,600 mi. of unimproved dry-weather roads. According to *Lloyd's Register of Shipping*, the merchant marine had 93 steamers and motor ships (100 tons and over) aggregating 156,910 gross tons on June 30, 1950.

Agriculture.—Production figures for the 1950–51 crop year included coffee 550,000 bags of 132 lb. each and cacao 19,000 short tons. Exports in 1950 were 310,490 bags and 17,150 tons respectively. Sugar production in 1950 was 55,572 short tons. The 1950 census (preliminary figures) showed 5,359,654 cattle and 1,292,808 pigs.

Manufactures.—Production in 1950 included cement 552,258 short tons; soap 16,428 short tons; cigarettes 1,943,716,000 units; beer 82,040,000 l.; electric energy 520,341,000 kw.hr.; natural gas 15,775,571,000 cu.m.

Mineral Production.—Production of crude petroleum by the 13 companies in operation in 1950 reached the record figure of 546,764,525 bbl., of which Creole accounted for 46% and Shell for 31%. Refinery throughout was 90,099,847 bbl., an increase of 70% over 1949, and the 14 refineries and topping plants in operation at the end of 1950 had capacity of 308,700 bbl. per day. Exports of refined products increased to 67,250,000 bbl. Gold production was 34,460 oz. and diamonds, 60,389 carats. Bethlehem Steel's Venezuelan subsidiary mined 1,241,151 short tons of iron ore in the first 11 months of 1951; production increased from 76,442 tons in Jan. 1951 to 163,241 tons in Nov. 1951. (J. W. Mw.)

Vermont.

A north Atlantic state of the United States of America, the only one of the New England states without a sea coast, Vermont is popularly known as the "Green Mountain state"; it was admitted to the union in 1791. Area: 9,609 sq.mi., of which 331 sq.mi. are water. Population (1950) 377,747 (including 240,135 rural, 137,612 urban).

Montpelier is the capital city with a population (1950 census) of 8,599. The chief cities are Burlington (33,155) and Rutland (17,659).

History.—The general assembly met from Jan. 3 to May 18, 1951, the longest session in the history of the state. Legislation enacted or amended included bills relating to aid for education of homebound children, consolidation of high schools, a change in the definition of the school year, licensing of amusement machines, salary withholding of state income taxes, civil defense and powers and duties of the health department.

The chief officers of the state during 1951 were: George D. Aiken and Ralph E. Flanders, U.S. senators; Winston L. Prouty, U.S. representative to congress; Lee E. Emerson, governor; Joseph B. Johnson, lieutenant governor; George H. Amidon, state treasurer; Howard E. Armstrong, secretary of state; David V. Anderson, auditor of accounts; Clifton G. Parker, attorney general.

Education.—The 762 elementary schools in the state in 1950–51 had an enrolment of 47,094 and a teaching staff of 1,888. There were 82 public high schools, with an enrolment of 15,693 and a teaching staff of 748. The total current expense for these schools was $11,481,314.50, of which the state paid 23.7% ($2,717,423.20). The state superintendent of schools was the commissioner of education, A. John Holden.

Social Insurance and Assistance, Public Welfare and Related Programs.—Relief in general was administered by the overseer of the poor in each town. Approximately 6,972 persons a month received old-age assistance from state funds amounting to $3,137,949 for the year 1951. Total payment of $665,760 to mothers' aid recipients (covering needy relatives and children) was made to an average number of 3,596 individuals monthly. Blind assistance funds to the amount of $89,674 for the year were distributed to about 182 persons a month. Aid to adult crippled and permanently disabled persons amounted to $61,266 for the year, distributed to approximately 179 persons a month.

Unemployment compensation payments made under the Vermont law numbered 72,244 and amounted to $1,378,504 in 1951; readjustment allowance payments under the G.I. Bill of Rights numbered 169 for an amount totalling $3,287. The three state correctional institutions during the fiscal year ending June 30, 1951, had an average of 387 inmates; their total expenses were $582,094.76.

Communications.—The total mileage of the public highway system (state, state-aid and town highways) as of June 30, 1951, was 13,676.76, of which 1,821.28 mi. were in the state system and 2,773.56 mi. were in the state-aid system. Total expenditures during the fiscal year ending June 30, 1951, amounted to $9,132,717.18, of which $5,651,903.94 was for state highways and $1,949,853.34 for state-aid highways. There were 932.42 mi. of railways in the state in the year ending Dec. 31, 1951; airports in the state numbered 20, seaplane landing areas 4 and airways 2, with a total mileage of 144. Telephone subscribers were estimated at 79,500 Dec. 31, 1951.

Banking and Finance.—The number of state and national banks as of June 30, 1951, was 77, of which 38 were state banks with total deposits of $216,229,854.13 and assets of $241,869,398.39. The eight co-operative building, savings and loan associations had total assets of $4,255,133.28.

Total receipts of the state as of June 30, 1951, were $36,426,483.88; disbursements $36,271,000.70; unappropriated surplus $637,031.78; obligations outstanding $5,644,000.00.

Agriculture.—The total value of crop production in Vermont in 1951 was reported by the U.S. bureau of agricultural economics at $51,575,000 compared with $52,407,000 in 1950.

The 1950 preliminary agricultural census returns indicated a decrease of more than 7,000 in the number of farms in the state in five years' time; the average size of the farms increased from 148.4 ac. in 1945 to 185.2 ac. in the latest count.

Table I.—*Principal Crops of Vermont*

Crop	1951	1950	Average 1940-49
Corn, all, bu.	2,788,000	3,312,000	2,423,000
Hay, all, tons	1,341,000	1,191,000	1,417,000
Oats, bu.	1,476,000	1,120,000	1,439,000
Potatoes, late, bu.	738,000	1,215,000	1,430,000
Apples, commercial, bu.	1,080,000	972,000	695,000
Maple syrup, gal.	733,000	875,000	802,000

Source: U.S. Department of Agriculture.

Manufacturing.—The Vermont unemployment compensation commission estimated that 38,800 workers were employed in manufacturing industries in the state throughout 1951. (C. E. Fe.)

Table II.—*Principal Manufacturing and Processing Industries of Vermont*

Industry	Value of products 1950	1949
Machines, machine tools and allied industries	$60,780,700	$63,061,400
Woollen, cotton and knit goods	47,606,280	51,571,000
Woodworking, furniture and lumber, etc.	41,070,720	36,906,150
Granite, marble and other stone industries	28,271,610	26,531,000
Paper and paper products	27,963,600	26,435,650
Dairy products	17,115,000	16,500,000

Mineral Production.—Table III shows the tonnage and value of mineral production in the state in 1949 for commodities having values in excess of $100,000, and corresponding data for 1950, so far as they were available at the close of 1951.

Table III.—*Mineral Production of Vermont*

(In short tons)

Mineral	1950		1949	
	Quantity	Value	Quantity	Value
Lime	32,843	$415,910	28,914	$356,381
Sand and gravel	1,040,977	661,994	1,581,614	728,394
Slate	238,740	4,471,869	184,040	3,624,230
Stone	447,310	8,038,892	441,770	8,276,287
Talc	72,135	906,396	64,508	788,341
Other minerals		?		3,610,685
Total		?		$17,384,000

Veterans Administration (U.S.).

By the end of 1951, living U.S. veterans of all wars numbered nearly 19,000,000, of whom 80% served in World War II. Veterans with their families made up about one-third of the nation's total population.

A number of laws were enacted during 1951 furnishing benefits to a young new group of veterans—those who served after June 27, 1950, the date of the outbreak of hostilities in Korea.

As a result of these laws, the veterans might get the following benefits under the same conditions that applied to their older fellow veterans of World War II: medical and hospital care, vocational training for the disabled, disability compensation and pensions and free cars for those with certain disabilities. In addition, the veterans were entitled to a new system of insurance protection.

Finally, the families of those who died were entitled to death compensation and pension and burial benefits, also on the same basis as for the families of deceased World War II veterans.

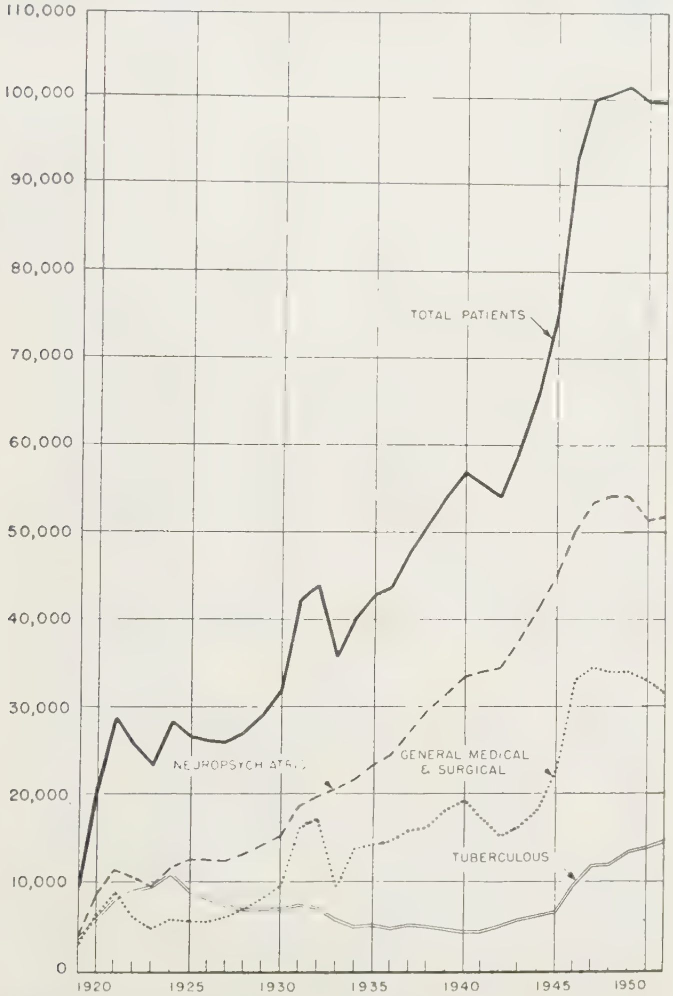
Following are close-ups of these and other benefits administered by the Veterans administration.

Medical and Hospital Benefits.—By Nov. 1, 1951, the VA was operating a network of 153 hospitals for the treatment of ill and disabled veterans. It also was utilizing beds in civil, state and other federal hospitals on a contract or agreement basis. At that time, a total of nearly 106,000 patients were in VA and non-VA hospitals.

A $750,000,000 VA hospital construction program was under way and was expected to result in 66 modern, new hospitals with a total of 37,000 beds. By Nov. 1, 1951, a total of 35 of the hospitals had been completed.

Veterans of all wars, as well as those with service after June 27, 1950, discharged under conditions other than dishonourable, were entitled to VA hospital care under the following priority system: (1) emergency cases; (2) those suffering from injuries or diseases incurred in or aggravated by wartime service; (3) those who stated under oath that they were unable to pay hospital charges for the treatment of nonservice-connected ailments. These veterans, if not emergency cases, had to wait until beds were available.

Vocational Training for the Disabled.—Vocational rehabilitation, at government expense, was available to disabled veterans of World War II, as well as to those disabled after fighting started in Korea. The veterans had to meet these qualifications: (1) a discharge other than dishonourable; (2) a compensable service-connected disability; and (3) a need for training to overcome the handicap of the disability.



NUMBER OF VETERANS remaining in VA and non-VA hospitals on Dec. 31 from 1919 to 1951 by types of disability, as compiled by the Veterans administration

VETERANS OF KOREAN combat exercising in a gymnasium at Walter Reed General hospital, Washington, D.C., in 1951. While learning to use artificial limbs, they kept other body muscles in proper form by daily workouts

Eligible veterans might train in schools, on-the-job or on-the-farm. While in training, and for two months afterward, they might receive subsistence allowances in addition to their disability compensation.

By Nov. 1, 1951, a total of nearly 600,000 disabled World War II veterans had taken training, at some time or other, under the program. Nearly half of them had completed their training and were declared rehabilitated. By the same date, 29 Korean veterans were in training, but the number was expected to grow as more received discharges from the service.

Compensation and Pension.—Compensation was payable to veterans with service-connected disabilities resulting from either war or peacetime service. Wartime rates ranged from $15 to $150 a month, depending upon the degree of disability, plus statutory awards for certain disabilities which might bring total payments up to as high as $360 a month. Peacetime rates were 80% of these wartime sums. Veterans disabled as a result of service after June 27, 1950, were entitled to the wartime rates.

Pensions, on the other hand, were payable to veterans of either World War I or World War II and to those who served after June 27, 1950, under the following basic conditions: (1) the veteran had to be totally and permanently disabled for reasons not traceable to his military service; and (2) his income could not exceed $1,000 a year if he was single, or $2,500 if he was married or had a minor child. The monthly pension rate was $60, which was increased to $72 after ten years or when the veteran reached age 65.

Widows, children and dependent parents of deceased veterans could qualify for death compensation, but only widows and children for death pension.

On Nov. 1, 1951, more than 3,000,000 veterans and dependents of deceased veterans were on VA's pension and compensation rolls. Of this number, about 10,000 were drawing payments as a result of the Korean conflict.

Insurance.—VA administers three systems of insurance: U.S. Government life, for World War I veterans; National Service life, for World War II veterans, and the Indemnity and Insurance acts of 1951, for those with service after the start of the Korean war.

The last set up an entirely new type of government life insurance for military personnel and veterans. It also changed the other two types of insurance in many ways.

Under the newest system, those in active military service after June 27, 1950, and certain other groups, were automatically covered, without cost, against death in active service for $10,000, less any other government insurance they might have had at that time. The free indemnity lasted for 120 days after separation from service, for those on active duty for more than 30 days.

Also, under the program, a veteran, upon separation from service, could apply for certain specified types of insurance which he could hold so long as he paid the low-cost premiums.

Through Nov. 1, 1950, VA had allowed nearly 2,000 indemnity claims from the families of deceased servicemen.

The number of National Service life insurance policies in force at that time was 7,126,000, totalling nearly $50,000,000,000. Also, 464,000 U.S. Government life insurance policies were in force, totalling $2,000,000,000.

The G.I. Bill.—Of the three major provisions of the G.I. bill for World War II veterans, one still was in force during 1951, one had passed the cut-off point and the third had expired for most veterans.

Under the G.I. loan program, which had five more years to run, a total of 2,800,000 veterans had obtained loans valued at $16,600,000,000 by Nov. 1, 1951. The G.I. education and training program passed its cut-off date for starting on July 25, 1951. By that time, 7,500,000 veterans—or half of all who served in World War II—had taken training.

The third benefit, readjustment allowances for unemployed and self-employed veterans, ended for most former servicemen on July 25, 1949. Nearly 9,000,000 veterans had received allowances in the amount of $3,800,000,000. (*See* also Medical Rehabilitation of the Disabled; Tuberculosis.)

(C. R. Gy.)

Veterans' Organizations.

United States.—In 1951 there were fewer veterans who paid dues to national veterans' organizations than in any year since World War II. The figure probably totalled considerably less than 5,000,000.

The developments in Korea had made the nation once more aware of the veteran problem, but had not yet had any effect on membership. All of the organizations, however, had amended their constitutions so that they might accept Korean veterans for membership.

American Legion. — The American Legion (membership 2,800,000) faced a major membership and financial problem. For the past three years it lost members at the rate of 200,000 a year. The Legion national convention held in Miami, Fla., elected Donald Wilson of Clarksburg, W.Va., national commander replacing Erle Cocke, Jr., of Georgia. Highlight of the convention was an address by General of the Army Douglas MacArthur who heavily attacked the foreign policy of the administration of Pres. Harry S. Truman. The platform of the American Legion also attacked the far eastern policy of the government and of Secretary of State Dean Acheson. It urged immediate adoption of universal military training and extension of benefits to veterans of Korea.

AMERICAN LEGION headquarters building being dedicated by Pres. Harry S. Truman in Washington, D.C., on Aug. 14, 1951

Veterans of Foreign Wars.—The Veterans of Foreign Wars (V.F.W.) continued to lose membership, its total at the close of 1951 being about 1,000,000. The V.F.W. national convention, held in New York city, elected Frank C. Hilton of Reading, Pa., as national commander to succeed Charles C. Ralls. The outstanding event of the V.F.W. convention was the failure of a resolution favouring a bonus for World War II veterans. This was the first time a probonus resolution had failed in V.F.W. history since World War II. The V.F.W. convention, like the American Legion, hit a high political note. Included among the platform resolutions passed were the following: an attack on Secretary of State Dean Acheson; a request for a congressional investigation of the World Federalist movement; a demand that the U.N. boycott Communist China; the banning of Communist meetings; universal military training.

Disabled American Veterans.—The Disabled American Veterans, which in 1951 had a membership of 125,000, was the most service minded of all veterans groups. Its membership had varied the least and the organization had usually steered clear of political controversy. The national convention, held at Milwaukee, Wis., elected Ewing W. Mays of Little Rock, Ark., as national commander, replacing Boniface Maile of Detroit, Mich. The convention, concentrating on veterans' issues, attacked the Hoover committee recommendations, urged an increase in disability compensations and asked for veterans' benefits for Korean veterans.

American Veterans of World War II (Amvets).—American Veterans of World War II, with a membership of 75,000, was the largest of the organizations for veterans of World War II. The national convention, held in Boston, Mass., elected John Smith of Ohio to succeed Harold Russell of Boston, Mass., as national commander. The convention program urged: the ouster of Carl Gray as head of the Veterans administration; a G.I. bill of rights for Korean veterans; a peace and preparedness program based on co-operation with the United Nations.

American Veterans' Committee.—American Veterans' committee, whose membership was 20,000, was the second largest World War II veterans' group. The national convention reelected Michael Straight of Washington, D.C., as national commander. The convention adopted resolutions urging the ouster of Veterans Administrator Carl Gray, the extension to Korean veterans of the G.I. Bill of Rights and universal military training.

Other Organizations.—The International Federation of War Veterans celebrated its first year of existence in convention at Belgrade, Yugoslavia, by changing its name to the World Veterans federation. Fourteen nations representing 13,000,000 veterans were affiliated with this group. In 1951 groups from Canada, Norway, Denmark, Philippines and Israel joined. Represented from the United States were the American Veterans of World War II, Disabled American Veterans, American Veterans Committee and the Blinded Veterans association.

Veterans' organizations in 1951 seemed to be awaiting the outcome of the uncertain international situation so that they might know in which direction to move—toward expansion or contraction. (Ri. A. B.)

Canada.—The Canadian Legion (largest single Canadian veterans' group, with about 300,000 members in 2,200 branches) opened the year with a call for a country-wide drive to bring compulsory military training to Canada quickly. The drive also protested the believed shortages of national defense equipment and the inadequacies of defense organization. National registration, as part of the compulsory military training in reserve forces, was advocated. Brooke Claxton, National defense minister, replied to the Legion by revealing that Canada had $330,000,000 of aircraft, $96,000,000 of ships, $35,000,000 of clothing on order, and that during the second six months of 1950 the number of Canadian fighting units had been doubled. Later in the year the Legion and the national council of veterans' associations in Canada began a drive for an increase in the basic pension rates for all veteran pensioners, as well as war veteran allowance rates. In November federal veterans' affairs minister Hugues Lapointe announced basic pension increases ranging from 33⅓% to 45%; and a special governmental committee was announced for the study of proposed changes in the war veterans' allowance act.

Major changes were made in the constitution of the Canadian Legion by an act of parliament. The power of making bylaws was taken from the national executive and placed in the hands of the national convention of the Legion; the revisions to the act gave provincial conventions the right to make bylaws for provincial commands. A special order stated that expulsion faced any legionnaire who was a Communist or was associated with the so-called Peace Council. (C. Cy.)

Veterinary Medicine.

During 1951 new schools were founded to confer the degree of doctor of veterinary medicine. Also teaching staffs were enlarged, new college buildings erected and enrolment of veterinary students increased despite higher entrance requirements, particularly in the far east, Germany and the United States. The critical world food situation continued to turn more and more attention to the control of diseases of food-producing livestock. Commercial research laboratories devoted to pet animals were constructed and existing ones refined and enlarged to keep pace with the developments of that branch of medicine, and numerous luxurious and scientifically equipped pet animal hospitals were established.

The Role of Domestic Animals in Q Fever.—A notable change took place in the knowledge of Q fever. Formerly (until 1944) believed to exist only in Australia and the United States, later studies showed that this rickettsial infection was actually world-wide. Cases were reported in Greece, Bulgaria, Spain, Italy, Germany, Algeria, India, Iraq and Panama during the year, and, moreover, sheep and goats as well as cattle were proved to be carriers of the specific organism—*Rickettsia burnetii.* An outbreak in southern California in 1947 revealed by 1951 that the previously undiagnosed disease was widespread in many countries among the handlers of domesticated ruminants.

Artificial Insemination in Cows.—The insemination of cows artificially increased in efficacy and general popularity. In round numbers 3,000,000 cows were bred in the United States in that manner during 1951, or approximately 15% of the dairy cow population. The increasing resort to this method of breeding dairy cows was attributed mainly to improved methods of handling bulls' semen. It was demonstrated that the addition of antibiotics—streptomycin alone or with penicillin—more assuredly maintained the fertility and longevity of the spermatozoa so that small dairy farmers were able to procure the service of selected bulls at faraway places.

Egg yolk buffered with sodium citrate (2.9%) in 75 to 100 parts of sterile water for each part of ejaculate, plus 500 micrograms of streptomycin per millimetre of the diluent, was the recommended preparation of bulls' semen for artificial insemination. It was, however, generally accepted that accurate prediction of the fertilizing property of any ejaculate was not possible in any event.

Bovine Anaplasmosis Travels Northward.—Although the insect-borne disease, anaplasmosis of cattle, had been recognized in 28 states of the south and southern part of the middle west for many years, its discovery in 1951 for the first time as far north as Minnesota came as a surprise. It seemed to have been brought to Minnesota in 1949 with Hereford cattle imported from the southwest. The diagnosis was made by local veterinarians and confirmed by investigators of the U.S. bureau of animal industry who not only isolated the causal organism—*Anaplasmosis marginale*—but reproduced the disease by experimental inoculations. Inasmuch as one of the principal vectors is the stable fly of the family Tabanidae which flourishes in all parts of the temperate zone, veterinarians were warned against mistaking the apparently new visitation in the acute form for anthrax, haemorrhagic septicaemia, forage poisoning, mineral toxicosis, etc. They were also reminded that the mild form in calves may remain unobserved, but nevertheless is capable of spreading the infection through the natural means of infection—insect vectors—or by means of the surgical instruments employed in castration, ear tagging, blood testing or dehorning. Tiny particles of blood of an affected animal were again shown to be a common source of the infection among gregarious animals, surgically treated one after the other.

Equine Encephalitis in the United States.—A report of the U.S. bureau of animal industry, dated May 31, 1951, revealed the incidence of infectious equine encephalomyelitis during 1950. A graphic map showing the location of outbreaks indicated that 33 states were involved and that the total of reported cases was 1,033 with a mortality of 41%, compared with 60% in 1949. The peak months were from July to October. Control methods included the vaccination of 89,000 animals. No human cases were reported. The report again emphasized the virtue of the specific vaccine generally employed in districts where outbreaks occur.

Tuberculosis of Animals.—Though bovine animals are the natural hosts of the tubercle bacillus, few species of domestic animals and wildlife escape the infection and, moreover, the varieties (types), called human, bovine and avian are not as host-specific as their names imply. According to studies carried out at the Mayo foundation, the varieties, *Mycobacterium hominis, M. bovis,* and *M. avian* are more interchangeable than the prevailing belief had indicated. An individual subject (man or animal) may be carrier of one or more of these varieties. Swine, for example, were found to be infected with both avian and bovine types or even all three types at the same time, and the finding of the human bacillus in the bovine species was no longer a rarity. That consumptive human beings infect their cattle was amply proved, and the danger of cohabitation of man with tuberculous cows was well known. Adequate control of tuberculosis and eventual elimination from a species depends upon its elimination from all species. Though milk is the usual transmitter of bovine tuberculosis to man (and especially children) the farmer, caretaker, butcher, veterinarian and housewife may contract the infection by the handling of animals or their products. No mammal or fowl is absolutely secure against the tuberculosis of the species of the other.

Aureomycin.—Among the antibiotics having a wide speculum of activity in diseases of animals, aureomycin was shown to stand first as a utilitarian product of its kind. Discovered in 1947, it won a higher rating in chemotherapy than the other products of Streptomyces because it was effective against both gram-negative and gram-positive organisms, besides having the property of not elaborating a protective antagonist like, for example, penicillin. It had been widely employed in human medicine and in the United States had undergone extensive field trials. Unlike penicillin, aureomycin is suitable for oral use. Except in calves before the rumen function has developed, it is given intravenously because its action interferes with the growth of the useful flora of the rumen. It has a wide range of usefulness in cattle, horses, dogs, cats and foxes, and was shown to be particularly active against *Trichmonas foetus,* in which infection it proved to be much more active than the other antibiotics.

Caesarean Section in Cows.—New interest in the operation in cows was revived by a contribution on the subject at the session of the *Société de médecine vétérinaire* of Lyon (France) held in connection with *les Journées vétérinaires de 1950.* The preparation, restraint, instruments and operative technique were described in minute detail. The technique described made a considerable impression on the veterinarians of English-speaking countries.

Mexican Foot-and-Mouth Disease Epizootic.—The international commission of Mexico and the United States appointed to take charge of the outbreak of foot-and-mouth disease that occurred in five districts of central Mexico in 1946 announced in 1951 that the epizootic had been brought under complete control. There were but two trivial flare-ups in 1949 and 1950 and none in 1951. The commission, however, decided to maintain its rigid quarantine and supervision for two more years before announcing that its work was finished. Credit was given to the virtue of extensive vaccination and strict quarantine measures.

American Veterinary Medical Association.—The 88th annual meeting of the American Veterinary Medical association was held at Milwaukee, Wis., Aug. 20–24, 1951. The registered attendance was 3,124, and the scientific and commercial exhibits far exceeded those of former meetings. Among the discussions which characterized the veterinary profession's current objectives were (1) the relationship of veterinary medicine with the U.S. public health service and local health programs, (2) the participation of veterinary practitioners in the control of human brucellosis, (3) the probable replacement of virus-serum vaccination of hog cholera by an avirulent vaccine produced by the passage of the virus through rabbits, (4) the urge for more general participation in poultry medicine, (5) the medullary pinning of fractures in small animals, and the use of the Thomas splint and Schaffer sleeve, and (6) planning for the proper utilization of veterinarians for the national defense.

Vinson, Frederick Moore (1890–), chief justice of the U.S. supreme court, was born on Jan. 22 at Louisa, Ky. He was graduated from Kentucky Normal college in 1908; received his B.A. (1909) and his law (1911) degrees from Centre college, Danville, Ky., and practised law in Louisa. He served seven terms in the U.S. house of representatives, and was a key man in congress during the early days of the Franklin D. Roosevelt administration. In 1938 he was named associate justice of the U.S. court of appeals for the District of Columbia, and in May 1943 was named director of the Office of Economic Stabilization.

Vinson changed posts three times in 1945, becoming respectively federal loan administrator, director of the Office of War Mobilization and Reconversion and secretary of the treasury. In June 1946, Pres. Harry S. Truman appointed him chief justice of the U.S. supreme court. In the early political alignments looking forward to the 1952 presidential elections, Justice Vinson was frequently regarded by Washington observers as the Truman choice for the Democratic nomination for the presidency, provided Truman decided not to run again himself.

Virginia. One of the 13 original states of the United States, Virginia was admitted to the union June 26, 1788; it is known as the "Old Dominion" and as the "Mother of Presidents." Southernmost among the middle Atlantic states, Virginia has an area of 40,815 sq.mi., including 922 sq.mi. of water. Pop. (1950) 3,318,680, compared with 2,677,773 in 1940. Principal urban areas include the capital, Richmond (230,310 in 1950), Norfolk (213,513), Arlington county (135,449), Roanoke (91,921) and Portsmouth (80,039).

History.—The year 1951 was a quiet one for Virginia's state government. The general assembly did not convene, though a number of its interim committees were active. One of these was charged with recommending new congressional district lines to provide a tenth district by reason of population increases. Another investigated the state's high rate of automobile deaths (slightly more than 1,000 persons died in auto accidents during the year) and offered proposals by which the toll might be reduced. A third committee surveyed the state's ten tax-supported institutions of higher learning, and recommended that a chancellor of higher education be named to supervise the entire system. Other groups looked into means of promoting greater commerce at the port of Hampton Roads, and at the methods for providing judicial review of actions taken by state administrative agencies. At the end of the state's fiscal year in June, when it was found that general fund revenues had surpassed $105,000,000, a reduction of 20% in state income tax payments was decreed for 1951. John Stewart Battle served as governor throughout the year; his term was to expire in 1954. L. Preston Collins was lieutenant governor and J. Lindsay Almond, Jr., attorney general.

Education.—In 1950–51 elementary school enrolment was 470,190, with a teaching staff of 12,856; secondary school enrolment was 154,951, with a teaching staff of 5,772. The teaching staff also included 1,263 instructors in vocational education and 1,951 principals and head teachers. D. J. Howard was state superintendent of public instruction.

Social Insurance and Assistance, Public Welfare and Related Programs.—For the year ended June 30, 1951, 10,974 persons received $1,187,934 in general relief; 23,889 received $5,148,191 in old-age assistance; 11,921 families with 34,176 dependent children $4,923,233; 5,628 under the foster care program $933,546; 2,548 totally and permanently disabled $478,750; and 1,805 blind $550,417. In 1951, 333,061 checks representing 381,065 weekly payments were written for civilian unemployment compensation, amounting to $5,928,687. This was nearly $5,000,000 less than such compensation in 1950. Also, in 1951, 990 checks representing 1,660 payments for war veterans' readjustment allowances were written for $32,828.

The average daily population of six penal institutions for adults was 5,320, and of four industrial schools for juveniles was 606, at the end of the fiscal year in June 1951.

Communications.—On Jan. 1, 1951, there were 8,996 mi. of highway in the state's primary system; on July 31, 1951, there were 39,089 mi. in the secondary system. During the year ended June 30, 1951, the state spent $65,446,325 on its highways, up 16% from the previous year's expenditures. The total railroad mileage was 4,127.31 on Jan. 1, 1951. There were 602,163 telephones in Virginia on Nov. 30, 1951.

Banking and Finance.—On June 30, 1951, Virginia had 180 state banks with 58 branches and 132 national banks with 36 branches. On June 30, 1951, deposits in national banks were $1,123,259,000 and assets $1,224,774,000. On June 30, 1951, deposits in state banks totalled $819,266,818 and assets $897,635,760. Resources on Dec. 31, 1950, of 16 industrial loan associations were $12,592,065; of 55 building and loan associations $3,687,727; of 29 credit unions $2,396,422.

For the fiscal year ended June 30, 1951, the state treasurer received revenues of $338,852,720, about 7.9% more than in the previous year; expenditures were $359,086,240. The gross debt on June 30 was $12,384,450; a sinking fund of $11,638,964 left a net debt of $745,487. The fiscal year ended with a cash general fund surplus of $62,864,586, plus an invested surplus of $16,754,800.

Agriculture.—The 1951 crop year suffered from a serious drought in the late summer which reduced corn yields and had a highly adverse effect on hay and pastures. Total acreage in principal crops was estimated at 3,600,000 ac. The state's cattle herds were at the largest point on record, with 1,200,000 head; the year's crop of 1,500,000 pigs pushed the record of 1943. In the Shenandoah valley area, turkey growers worked closer toward a year-round industry with 3,500,000 turkeys sent to market. Tobacco production was the second largest on record, and had the largest value.

Table I.—*Principal Crops of Virginia*

Crop	1951	1950	Average 1940–49
Corn, bu.	41,624,000	44,528,000	39,743,000
Wheat, bu.	7,497,000	6,768,000	8,117,000
Oats, bu.	4,818,000	4,378,000	3,700,000
Rye, bu.	276,000	280,000	478,000
Barley, bu.	2,624,000	2,714,000	2,221,000
Buckwheat, bu.	33,000	36,000	117,000
Tobacco, all types, lb.	175,330,000	165,496,000	131,971,000
Peanuts, lb.	226,300,000	221,920,000	188,021,000
Hay, all, tons	1,641,000	1,637,000	1,588,000
Apples, commercial, bu.	10,064,000	12,580,000	9,331,000
Peaches, bu.	1,950,000	837,000	1,572,000
Cotton, lint, bales	16,000	4,000	24,000
Potatoes, bu.	6,882,000	7,964,000	8,998,000
Sweet potatoes, bu.	2,210,000	2,210,000	3,255,000
Soybeans for beans, bu.	2,988,000	2,888,000	1,277,000

Source: U.S. Department of Agriculture

The total value of crops, including fruit crops, was placed at $319,802,000, 3% above the corresponding 1950 value of $311,857,000.

Table II.—*Principal Industries of Virginia*

Industry	1950	1949
Tobacco products	$785,153,000	$748,982,000
Chemical products	500,122,000	439,003,000
Textiles and their products	430,228,000	325,195,000
Food and kindred products	422,083,000	315,993,000
Paper and allied products	148,218,000	116,363,000
Furniture and fixtures	116,585,000	87,265,000
Wearing apparel	99,264,000	75,874,000
Lumber and wood products	96,901,000	59,347,000
Fabricated metals	62,635,000	39,338,000
Stone, clay and glass products	60,378,000	39,378,000
Printing and publishing	47,826,000	30,523,000

Table III.—*Mineral Production of Virginia*

(In short tons)

	1950		1949	
Mineral	Quantity	Value	Quantity	Value
Clays	545,984	$ 519,641	449,122	$ 403,598
Coal	17,666,647	96,965,407	15,584,087	82,366,554

Stone	9,272,740	16,434,602	7,509,740	12,442,765
Zinc	12,396	3,520,464	13,166	3,265,168
Other minerals		?		9,270,172
Total		?		$116,293,000

*Values for processed materials are not included in the totals.

Manufacturing.—The value of products manufactured in Virginia was estimated by the state department of labour and industry, on the basis of reports from 2,088 plants, at $3,143,689,000 in the year ended Dec. 31, 1950. Total wages and salaries were placed at $573,215,000, of which 182,915 production workers received $443,218,000, and 29,630 supervisory and clerical workers $129,997,000. (J. J. Kt.)

Mineral Production.—Table III shows the tonnage and value of mineral production in the state in 1949 for commodities having values in excess of $100,000, and corresponding data for 1950, so far as they were available at the close of 1951.

FILMS OF 1951.—*Mount Vernon in Virginia* (McGraw-Hill Book Co., Text-Film Department).

Virgin Islands.

The Virgin Islands have the status of an organized but unincorporated territory of the United States, located 1,400 mi. S.E. of New York city and 40 mi. E. of Puerto Rico. The three largest islands, with a total area of 133 sq.mi., are St. Croix (pop. 12,096, preliminary census of 1950), St. Thomas (13,811) and St. John (747). The chief cities are Charlotte Amalie, the capital (11,463), on St. Thomas and Christiansted (4,110) and Frederiksted (1,925) on St. Croix.

Morris F. de Castro was inaugurated as governor on March 24, 1950. He was the first Virgin Islander to hold the position.

History.—Considerable progress was made on important projects under the $10,000,000 federal public works program for the Virgin Islands during 1951. Contracts were awarded for the construction of a 116-bed hospital at Charlotte Amalie, St. Thomas; a 60-bed hospital at Christiansted, St. Croix; a 12-bed clinic and public health facility at Frederiksted, St. Croix; and a 4-bed public health facility at Cruz Bay, St. John. The waterfront improvement project in St. Thomas was begun. The potable water supply facilities were completed and placed in operation.

The telephone communication facilities were being installed and were expected to be completed in 1952. Preliminary plans for high school and elementary school facilities in St. Thomas and St. Croix were being prepared.

Education.—Enrolment in the public schools of the Virgin Islands during 1951 totalled 4,944 as compared with 4,604 in 1950. Of this number, 2,196 students were enrolled in the elementary schools and 984 in high school in St. Thomas, while in St. Croix 1,352 were enrolled in the elementary schools and 412 in high school. Expenditures for public education in the Virgin Islands totalled $520,285, of which $99,639 was made available by the federal government. The average annual cost of education per pupil in the public schools was $70.28. This did not include the daily school lunch service. The average monthly salary per teacher in St. Thomas was $127.50; in St. Croix $123.95.

Finance.—Budgeted expenditures of the municipality of St. Thomas and St. John during the fiscal year 1951 amounted to $1,257,801. A total of $927,434 was raised through local taxation, and $279,200 was allocated from the federal deficit appropriation. Transfers and contributions from other funds, and temporary loans, made up part of the difference. The municipality ended the fiscal year with a deficit of approximately $51,367, chiefly because of a substantial reduction in the yield from trade taxes and customs dues, which were less than the estimated income from these sources.

In the municipality of St. Croix, a total of $431,777 was raised from local taxes. The allocation of $465,800 from the federal deficit appropriation enabled the municipality to meet its total budgeted expenditures of $901,199.

Trade.—The value of goods imported into the Virgin Islands during the calendar year 1950, $11,036,282, showed an increase over the value of imports in 1949, $9,967,225. There was also an increase in the value of exports in 1950, $3,106,282, as compared with $2,501,056 for 1949.

During the fiscal year 1951 a total of 332 commercial ships with a gross tonnage of 1,419,825 entered the port of St. Thomas, as compared with 335 ships and a gross tonnage of 1,794,697 in 1950.

Agriculture and Industry.—About 7,400 tons of sugar were produced, compared with 10,752 tons in 1950. A total of 459,544 proof gal. of alcoholic beverages was exported from St. Thomas as compared with 634,000 proof gal. in 1950. In St. Croix 70,250 proof gal. of alcoholic beverages were exported as against 27,943 proof gal. in the preceding year. (M. F. de C.)

Vitamins and Nutrition.

An attempt was made in 1951 to gain further information concerning the metabolism of certain of the B vitamins in the newborn infant and to seek evidence of biosynthesis of these substances in the intestinal tract during the first week after birth. The investigations indicated that during the first days of life the infant excretes quantities of thiamine, riboflavin and niacin in excess of those ingested in the diet. However, by the fourth day the infant is retaining ingested thiamine and riboflavin and is, therefore, in positive balance for these vitamins. This is not true, however, for niacin; excretion of this vitamin and its metabolites greatly exceeds the quantities ingested. The finding was not readily explained; other evidence indicated that the stores of niacin in the infant at birth are not great.

Riboflavin and niacin compounds in faeces were reduced after the first several days. Faecal thiamine excretion was not similarly decreased. Reduction of the faecal content of these vitamins may be taken as evidence of clearing of the intestines of these materials. Because reduced faecal excretion rates persist and do not increase, it may be reasonably concluded that the three vitamins are not synthesized by intestinal bacteria in any appreciable quantity within the first week after birth.

Nutrition and the Antibiotics.—Vitamin nutrition was found to be influenced by the common antibiotic agents such as penicillin and aureomycin that had come into such common use in the treatment of many infectious diseases. When added in minute amounts to the diet of some types of experimental animals, these antibiotics greatly increase the rate of growth. Research emphasized that the antibiotics have a particularly striking growth-stimulatory effect in crude diets that are deficient in vitamin B_{12} and also possibly in some growth factors which were still unknown in 1951.

H. Linkswiler, C. A. Baumann, and E. E. Snell, of the University of Wisconsin at Madison, reported that aureomycin increased the growth of rats that were fed a diet limited in vitamin B_6. The Wisconsin laboratory also studied the effects of several antibiotics on the growth of rats that were receiving limited amounts of thiamine, riboflavin or pantothenic acid. Groups of five weanling rats were fed diets deficient in one of these vitamins. Limited amounts of the vitamin with and without an antibiotic were included after varying depletion periods.

Rats receiving 0.5 mg. of thiamine per kilogram of diet and no antibiotic weighed 55 g. after a four-week feeding period, contrasted with weights of 69 g., 76 g. and 115 g. when the same diet was supplemented with streptomycin, aureomycin or penicillin respectively. Essentially similar growth-stimulation from these antibiotics was observed when the diet contained thiamine at a level of 1.0 mg. per kilogram of diet. Chloromycetin and terramycin did not stimulate growth under these conditions. The response with sulfasuxidine appeared to be somewhat delayed. The growth-stimulatory effect of this drug was equal to that of aureomycin between the second and fourth weeks of the experiment.

The growth-stimulating action of aureomycin or penicillin on marginal riboflavin intakes was paralleled by increased liver storage of this vitamin. Livers from rats on 0.5 mg. of riboflavin per kilogram of diet contained 51.7 micrograms of riboflavin, whereas the livers from rats on similar diets receiving penicillin contained 82 micrograms of riboflavin.

Rats receiving limited amounts of dietary pantothenic acid (0 to 4 mg. per kilogram of diet) grew better when the diet was fortified with aureomycin, streptomycin or penicillin.

These experiments were of particular interest in view of reports that the extensive use of antibiotics in human patients may lead to vitamin deficiencies. Results of the experiments seemed to be in conflict with these reports and again raised the question of the role of the antibiotics as they may influence intestinal bacteria in the synthesis and utilization of vitamins in humans. For example, it was reported that aureomycin and chloramphenicol therapy in man results in a marked stimulation of yeast growth in the faeces, and the feeding of live yeast was demonstrated to increase the requirement for thiamine in man.

The results by the Wisconsin workers did, however, suggest that the growth-promoting action reported when antibiotics are added to crude diets may well be associated with marginal or submarginal intakes of known B vitamins.

Diets of Older Persons.—An attempt to add to the knowledge of dietary intakes in a group of older people was reported from studies of chronically hospitalized older patients in Copenhagen, Den.

The patients studied (16 females and 4 males) were noted to have oral changes at the time of investigation suggestive of poor nutrition, and hence dietary intakes were followed to determine the nutritional habits of persons with such deficiency signs. All patients were leading a bed or wheel-chair existence and were not urged or assisted in the taking of food which was measured without the patients' knowledge for two one-week periods. Average daily consumption of calories, protein, calcium, phosphorus, iron, vitamin A, thiamine, riboflavin, niacin, ascorbic acid and vitamin D were then calculated and recorded.

The reported data indicated deficient intakes of all the nutritional elements studied, although marked variations in intake of different elements in the same person occurred. Thus patients who preferred milk received nearly normal amounts of calcium and phosphorus but suffered considerable inadequacy in their caloric intakes. Based on averages for the group, the most markedly deficient daily intakes were those of iron, thiamine, niacin, and vitamin D. Most of these subjects obtained less than half the minimal recommended intake of these nutrients. Despite the extremely low iron intake only six patients had haemoglobin values below 80% of normal, the lowest value being 66%. Other sources of iron not mentioned by the author such as drinking water might well be considered in explaining this discrepancy. Slightly higher daily ingestion was recorded for protein, calcium, phosphorus, vitamin A and riboflavin, but vitamin C intake alone approached the minimal requirements.

Caloric intake varied from 635 to 1,376, with averages for women and men being 1,037 and 1,332 respectively.

A somewhat comparable study was conducted in England among 30 active, apparently well, older persons and 24 with various infirmities. The British patients appeared to have higher caloric intakes (1,934 to 2,313) than those of the Copenhagen patients, and protein ingested was only slightly reduced (more than 42 g. in 80% of subjects). Markedly decreased intakes of vitamin C were found in the females in this study which contrasts with the nearly normal values found in the Copenhagen study. Vitamins A and D were also below minimum recommended levels, but B vitamin intakes were adequate in the British study as were calcium and phosphorus. While it should be emphasized that the patients studied in Copenhagen had pre-existing deficiency syndromes and were suffering from incapacitating diseases, the discrepancies in certain nutritional intakes such as vitamin C suggested wide differences in the diets offered. Thus not only do the tastes of individuals vary, but the dietary habits of given countries may vary so widely as to emphasize the dangers of the application to one country of dietary studies performed in another.

In older handicapped patients whose eating habits are likely to have become rigid it would seem wise to ensure that those foods which they take readily are of high nutritive quality, by enrichment or otherwise.

Glutamic Acid.—Articles in popular magazines inferred that the amino acid known as glutamic acid has special therapeutic properties for the treatment of various mental disorders; glutamic acid was described as a "brain food." It was claimed to result in an increase in the I.Q. of mentally retarded children and adults. These claims did not stand up under careful examination and were a good example of premature, sensational publicity based on inadequately controlled studies. Such claims usually result in more harm than good because of the false hopes they create. (*See* also CHEMOTHERAPY; MEDICINE; NUTRITION, EXPERIMENTAL.)

Vocational Rehabilitation, Office of.

This office, a constituent unit of the Federal Security agency, administers grants-in-aid and supplies leadership and technical assistance for the state-federal vocational rehabilitation program, a public service to prepare handicapped civilians for or to keep them in jobs commensurate with their fullest capabilities. In 35 states, separate agencies are responsible for rehabilitating the blind. In other states, rehabilitation of the blind and the generally disabled is the responsibility of a single agency.

Various combinations of the following services are provided, according to the disability and need of each individual. Those numbered 1, 2, 5, 8 and 9 are furnished without charge and the others are paid for from public funds to the extent of the individual's inability to pay: (1) medical examination to determine eligibility and extent of disability, to discover hidden disabilities and to ascertain work capacity; (2) individual counsel and guidance, including interest and aptitude tests, to help the disabled person choose and attain a job objective within his physical limitations but commensurate with his best potential abilities; (3) medical, surgical and psychiatric treatment and hospital care to reduce or remove the disability; (4) artificial appliances such as limbs, braces and hearing aids to improve work ability; (5) training in school, on the job or by tutor to fit the individual for the right job; (6) maintenance and transportation during physical restoration and training; (7) occupational tools, equipment and licences to give the handicapped person a fair start; (8) placement on the right job; and (9) a follow-up to make sure the rehabilitant and employer are mutually satisfied or to effect necessary adjustment.

Any person of or near working age who has a physical or mental disablement which constitutes a substantial vocational handicap is eligible. Through 1951, nearly 613,000 persons had been rehabilitated since the first vocational rehabilitation act was adopted in 1920.

During the fiscal year ending June 30, 1951, 66,193 persons were rehabilitated into self-supporting jobs and another 14,435 persons had been placed in jobs and were awaiting a post-rehabilitation check at the year's end. In addition, 12,948 persons were ready for jobs on June 30 and the active rolls listed 112,184 persons in earlier stages of rehabilitation.

According to preliminary tabulations for 1951, more than two-thirds of the rehabilitants were men and 48% had one or more dependents. Approximately 71% were unemployed when services were started and nearly 11% had never worked before. Orthopaedic disabilities were the most common, being the primary handicap of 42% of the rehabilitants. Of these, 12% were amputees and 30% suffered from other impairments of the extremities or bones. Visual disabilities accounted for 12%; aural, 9%; tuberculous, 9%; mental, 7%; cardiac, 4%; and all other defects, including ulcers, hernia, speech and asthma, 17%.

The annual rate of earnings of the rehabilitants when services were started was estimated at $18,000,000, mostly in temporary, unsafe or otherwise unsuitable jobs. The annual rate of earnings for the first year after rehabilitation was estimated at $100,000,000, on which federal income taxes were estimated at $5,900,000. Within four years, the 1951 rehabilitants would pay in income taxes as much as the entire 1951 federal expenditure for the rehabilitation program, which was $21,000,000. At the same time, they would also be paying state taxes. State expenditures totalled $9,271,000.

The rehabilitants of 1951 added an estimated 100,000,000 man-hours a year to the nation's productive effort. About 10,000 of these entered the skilled trades and were serving in occupations essential to the defense program, and more than 6,000 were farmers or agricultural workers. About 1,400 were teachers, many helping to relieve a severe shortage in the primary grades. At least 260 qualified as engineers, and an estimated 1,400 went into medicine and related work in hospitals, laboratories and similar facilities. Twenty per cent of the handicapped persons receiving vocational training under the program in ten states chosen for study were being prepared for occupations listed by the department of labour as critical to the defense effort.

The number of men and women throughout the country who were disabled to the extent of needing rehabilitation services was estimated at between 1,500,000 and 2,000,000 in 1951. Every year as a result of chronic illness, accidents and congenital defects about 250,000 persons were becoming disabled to a degree requiring rehabilitation services. (*See* also MEDICAL REHABILITATION OF THE DISABLED; VETERANS ADMINISTRATION [U.S.].)

(M. E. SR.)

Wages and Hours.

Manufacturing pay rolls in the U.S. during Sept. 1951 reached a dollar level 4.4 times that of 1939. This represented a gain of 14% over 1950, and compared with an increase in manufacturing employment of 2.5% for the year.

Total employers' disbursements, including wages and salaries, reached $14,308,000,000 in Sept. 1951. This was a 14% increase over the same month in 1950.

The postwar upward progress in real wages continued during 1951, although the all-time peak of 148.8 (based upon 1939 averages) was reached in Dec. 1950. Average real wages for the first 10 months of 1951 exceeded the 1950 figures by 1.7%, as shown by Table I.

Table I.—*U.S. Real Wage Indexes*

(1939=100)

	Consumers' price index		Index of average weekly manufacturing wages		Index of real wages

Source: *Survey of Current Business*, United States Department of Commerce.

The building construction industry continued to enjoy the highest average weekly earnings: $85.52. This marked an increase of 12.7% over the highest figure for 1950. The greatest comparative increase in average weekly earnings was one of 13.3% in both metalliferous mining and bituminous coal mining.

The lowest average "take-home pay" was made to hotel employees ($35.90), not including tips, board, room or uniforms.

Clerks in general merchandise stores again received second lowest weekly earnings ($37.02), but this ignored calculation of commissions. For manufacturing as a whole, average weekly earnings increased 8.1% over 1950, compared with a 10.3% gain in the previous year. Weekly earnings were down in 1951 in textile-mill production and in miscellaneous manufacturing, the declines apparently attributable to layoffs. The weekly income in anthracite mining also declined substantially, despite an increase of 11.7% in hourly wages. Anthracite coal miners had the shortest average work week (27.4 hours) in any recorded industry.

Table II.—*Average U.S. Weekly Earnings, Average Weekly Hours, and Average Earnings Per Hour In Major Industries*

Source: *Survey of Current Business,* United States Department of Commerce.

In Sept. 1951, 71% of the industries shown in Table II paid average weekly earnings in excess of $60. This compared with 67.7% in 1950. About 42% of the industries paid average weekly earnings exceeding $70, compared with 19.4% in Sept. 1950.

Table II indicates that the highest average hourly earnings occurred in bituminous coal mining ($2.239), followed closely by a rate of $2.233 in building construction. Proportionately, the greatest gain in hourly rates was one of 12.7% in the telegraph industry, followed by an 11.7% average hourly increase in anthracite coal mining. The weakest improvement was one of 4.2% in general merchandise stores, while the lowest dollar rate paid was $.831 in hotels. For manufacturing as a whole, average hourly earnings soared 9.0% above Sept. 1950, as compared with an increase of 4.6% in 1950 and one of 1.8% in 1949.

Table III reflects a 5-year climb of 43.6% in hourly earnings rates for all manufacturing industries. The greatest 5-year increase was noted in lumber and allied products (58.8%). For the most part, the strongest 5-year gains noted in 1951 were in the soft goods industries. This probably was attributable to the strong wartime gains made earlier in durable goods employment.

The Sept. 1951 average hourly rate for common labour was $1.637, compared with $1.561 in 1950 and $.47 in 1941. There was a strengthening in farm wages from $.66 per hour (not including room and board) in 1950 to $.73 in Sept. 1951. This was still slightly below 1949 and 1948, but marked an increase during the year of 10.6%.

The steady increase in average weekly earnings throughout the postwar period continued through 1951, as did the steady upward trend in the cost of living. These two factors, plus the observed fillip in hourly wage rates, clearly indicate the strong inflationary pressures which remained in the economy. Some soft spots appeared in textile production and anthracite mining, as reflected in shorter work weeks, but these particular weaknesses did not indicate an economy-wide trend affecting economic stability.

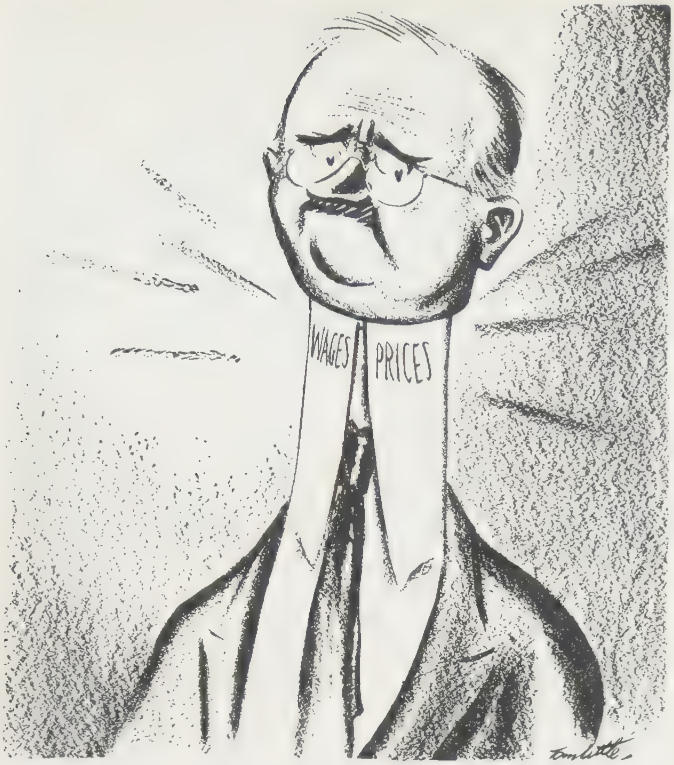
The general trend throughout 1951 in hourly and weekly earnings and in real wages continued to be upward.

(D. J. H.)

Europe.—The rises in retail prices during 1951, caused mainly by the sharp increase in world prices of raw materials and certain foodstuffs and by the inflationary effects of rearmament superimposed on conditions of full employment, led to widespread demands for higher wages in many countries. By the middle of 1951 general consumer prices in France were 29% above those of 1949, in Norway 24%, in Sweden 19% and in Great Britain 13%. These increases hit especially persons living on fixed incomes and workers paid by time who were unable to increase their earnings by working longer hours.

Average hours worked showed some tendency to rise: in France from 44.5 a week in 1949 to 45 in 1950 and to 45.2 in the early months of 1951; in Great Britain from 45.5 in 1949 to well over 46. In most of the countries affected, the trade unions made special claims for increases in the wages paid to the lowest paid groups of workers, including those in the public services, whose earnings had tended to lag seriously behind. But these increases also provoked protests from the more skilled workers, who complained, especially in time-week occupations, that their differentials were being reduced to a point seriously prejudicial to recruitment and training for skilled trades.

There was a drift of juvenile and even of adult skilled labour from such industries as the railways to the engineering and electrical trades, where piecework and other incentive payments were more generally to be had. In France, governments faced by huge budget deficits and by a threatening inflationary situation were forced to grant wage advances, by the combined pressure of all sections of the trade union movement; but real wages continued to lag and considerable hardships were experienced. Italy suffered from the same problem and so to a smaller extent did Western Germany. In Great Britain the policy of wage restraint, which had been repudiated by the Trades Union congress in 1950, definitely came to an end, and substantial



"WHITE COLLAR MAN," a 1951 cartoon by Little of the *Nashville Tennesseean*

increases were given to a number of trades. Compulsory arbitration, however, remained in force up to Aug. 1951 when it was given up and the National Arbitration tribunal was able to exert a moderating influence.

Table IV.—*Average Hours Worked in Great Britain*

	Men	Women	Youths	Girls
1938	47.7	43.5	46.2	44.6
1950	47.0	41.9	44.2	42.5
1951	47.9	42.0	44.5	42.7

In France, average hourly rates of wages (not earnings) in March 1951 were, for men 97.20 fr., for women 85.50 fr. and for both sexes 93.90 fr. In Australia, at the same date, adult men earned on an average £11 6*s.* 8*d.* a week, and the weekly rate for women averaged 144*s.* 1*d.* In western Germany weekly earnings in manufacturing industries averaged for men DM.73.80 and for women DM.43.50. In Sweden, the hourly earnings averaged 2.60 kronors for men and 1.85 kronors for women. In Norway the men's hourly average was 3.50 kronors. Comparable figures distinguishing the sexes were not available for other countries.

Table V.—*Average Weekly Hours in Nine Countries*

	Men and Women	Date
United States	41.1	March 1951
Japan	49.5	March 1951
France	45.2	March 1951
Australia	40.0	Dec. 1950
Canada	42.2	March 1951
Finland	45.2	Sept. 1950
Germany (western)	49.1	Sept. 1950
Switzerland	47.8	March 1951
Great Britain	46.3	April 1951

For men and women together, weekly earnings in manufacturing trades averaged $64.60 in the United States and $50 in Canada. The figures for June 1951 were higher—for the United States $65.30 and for Canada $51.60.

Walton, Ernest Thomas Sinton

(1903–), Irish physicist, was born at Dungarran, County Waterford, Ire., Oct. 6. He was educated at Banbridge (County Down) and Cookstown (County Tyrone) academies and at the Methodist college, Belfast. In 1922 he entered Trinity college, Dublin (of which he was later a fellow from 1934), and in 1927 went on to Trinity college, Cambridge university, where he worked with Sir John Douglas Cockcroft (*q.v.*) under Lord Rutherford at the Cavendish laboratory. He held successively an 1851 overseas research scholarship (1927–30), the senior research award of the department of scientific and industrial research (1930–34) and the Clark Maxwell scholarship (1932–34). From 1946 he was Erasmus Smith's professor of natural and experimental philosophy in the University of Dublin. On Nov. 15, 1951, the Royal Academy of Sciences, Stockholm, Swed., announced that the Nobel prize for physics had been awarded jointly to Walton and Cockcroft for their fundamental work on "the transmutation of atomic nuclei by artificially accelerated atomic particles."

Warren, Earl

(1891–), U.S. governor, was born on March 19 in Los Angeles, Calif. He was graduated from the University of California, Berkeley, in 1912, received his law degree in 1914 and was admitted to the bar the same year. He served in the army during World War I, and from 1925 to 1938 he was district attorney of Alameda county, Calif. In that year he was elected attorney general of California. He won a reputation as a "racket buster," and in 1942 was elected governor of California. In 1946 he shattered precedent in the state by winning both the Republican and Democratic nominations in the June primaries, making his re-election assured. He ran as vice-presidential candidate on the G.O.P. ticket in 1948, with Thomas E. Dewey, but lost.

He was sworn in for a third term as governor Jan. 8, 1951, and told the state legislature that it was facing "not just a possible but a probable third world war," and must accordingly make civil defense a major objective. On Feb. 27 he opposed the proposal of former Pres. Herbert Hoover that the U.S. might develop itself into an "American Gibraltar," and recommended taking the advice of military rather than of political men on the question of limitation of the number of troops that should go to the defense of Europe. On Nov. 14 he announced himself as a candidate for the presidential nomination of the Republican party in 1952.

Washington.

A state in the extreme northwestern United States, popularly known as the "Evergreen state," Washington was admitted to the union Nov. 11, 1889. Total area: 68,192 sq.mi., of which 66,786 sq.mi. are land; pop. (1940): 1,736,191; native 1,525,812; foreign-born 210,379. The 1950 U.S. census determination, as of April, placed the state's population at 2,378,963, an increase of 37% over 1940. In 1950 the urban population was 1,503,166 or 63.2% of the total population. The population of the three largest cities (1950 census) with the percentages of increase over 1940 were: Seattle, 467,591 (26.9%); Spokane, 161,721 (32.1%); Tacoma, 143,673 (31.3%).

History.—Although the Democrats had a majority in both houses of the state legislature in 1951, eight dissident Democratic state senators from time to time coalesced with the Republicans, particularly upon fiscal measures. The regular session of the 32d legislature met between Jan. 8 and March 19. Among numerous measures enacted pertaining to counties and cities was one designed to enable Spokane to purchase the electrical power facilities in the city. Anticipating the introduction of natural gas into the state, a law was passed to extend eminent domain to common carriers of oil and gas.

On the score that the legislature had not provided sufficient revenue to assure a balanced budget, Gov. Arthur B. Langlie vetoed the appropriation bill and called an extraordinary session of the legislature to convene on March 27. During this 11-day session, the legislature enacted an omnibus appropriation tax bill. On Aug. 20, the state supreme court declared this measure unconstitutional on the ground that the provision for the 4% tax on the income of corporations violated the rule of uniformity of taxes and that the bill had embraced more than one subject. A second extraordinary session of the legislature, which sat from Aug. 24 to Sept. 1, finally passed a separate appropriation bill and a "package" tax law, both of which were signed by the governor.

The chief state officers for 1952 were: governor, Arthur B. Langlie; lieutenant governor, Victor A. Meyers; secretary of state, Earl S. Coe; treasurer, Tom Martin; auditor, Cliff Yelle; attorney general, Smith Troy; state superintendent of public instruction, Pearl Wanamaker (elected on nonpartisan basis); state commissioner of public lands, Jack Taylor; state insurance commissioner, William A. Sullivan; chief justice of the state supreme court, E. W. Schwellenbach.

Education.—During the school year 1950–51, average daily attendance in the public schools was 364,351. The total number of teachers was 16,765 and the average salary for all certified personnel was $3,476.23. The total current expenditures were $87,543,000 (less school lunch receipts) and the cost per pupil in attendance was $240.10. The combined enrolment for the fall term of 1951 at the University of Washington, the State College of Washington and the three colleges of education was 21,463. Nine junior colleges, integrated with the secondary school program of the state but operated with state funds, had a total enrolment of 2,675 students.

Social Insurance and Assistance, Public Welfare and Related Programs.—During the period Nov. 1950 through Oct. 1951, inclusive, public assistance in the state, including federal expenditures and state aid, cost $91,169,404.29. An average of 139,587 persons received assistance to the total amount of $86,455,284.79. An average of 19,006 persons received a total of $8,485,118.95 in general assistance. An average of 75,414 old persons received a total of $53,128,237.84. An average of 41,232 children were assisted to the total amount of $16,742,275.09. An average of 936 blind persons received a total of $840,738.60. The above total amount for public assistance included a total amount of $2,241,834.18 allotted to an average 526 disabled persons, during the period April through Oct. 1951; a total amount of $171,163.88 for burials during the period May through Oct. 1951; and a total of $5,464,448.48 for health care during the period Oct. 1950 through April 1951.

During the month of Oct. 1951, eleven state charitable institutions had an average total population of 10,742 and four correctional institutions had a total of 2,368 inmates. The total appropriation for both programs for the fiscal biennium of April 1, 1951, to March 31, 1953, was $22,885,000.

Communications.—Railroad mileage in the state was 6,176 on Dec. 31, 1950. On Jan. 1, 1950, there were 178 airports in Washington of which 116 were in class I. The total mileage of highways in Washington on Jan. 1, 1951, was 41,896; total mileage of federal-aid highways on the state highway system was 5,926; total mileage of primary and secondary state highways 6,003; and the total mileage of highways, roads, and streets under county jurisdiction and management was 35,893. Total state expenditures for highways during the period Feb. 1, 1950, to Jan. 31, 1951, was $37,261,352; $25,651,564 was spent for construction and $11,609,788 for maintenance and administration. The number of telephones on Dec. 31, 1950, was 742,661.

Banking and Finance.—In 1951 the state board of equalization placed the value of taxable real and personal property at $3,783,793,312 and equalized it for purposes of taxation at $1,891,896,656. On March 31, 1951, the bonded indebtedness was $1,909,000; outstanding warrants amounted to a total of $49,706,436.98; and the treasurer's cash balance was $61,051,789.78. For the year ending March 31, 1951, total receipts were $535,864,930.99 and disbursements, including cash transfers, were $529,449,851.48.

On June 30, 1951, 121 banks in the state reported a total capital of $38,890,000; capital surpluses, undivided profits, and reserves at $145,993,401.32; deposits of $2,212,793,348.01; and total assets of $2,371,239,618.13.

Agriculture.—In 1945 the state had 79,887 farms whose acreage totalled 16,719,870, and in 1950 the new definition resulted in a reduced listing of 69,820 farms. The acreage for crops harvested in 1950 was 4,237,605. Total agricultural production in 1951 amounted to $644,611,000, of which field crops contributed $269,766,000, fruit, nut and berry crops $99,427,000, vegetables $25,962,000, livestock and livestock products $226,190,000, and specialty crops $23,266,000.

Table I.—*Principal Field and Fruit Crops of Washington*

	1951	1950	Average 1940–49
Wheat, bu.	75,152,000	69,692,000	61,580,000
Hay, all, tons	1,431,000	1,460,000	1,778,000
Potatoes, bu.	11,600,000	11,780,000	9,254,000
Hops, lb.	27,387,000	24,081,000	17,405,000
Peas, dry (100-lb. bags)	2,398,000	1,803,000	3,027,000
Oats, bu.	6,670,000	8,256,000	7,336,000
Barley, bu.	3,384,000	8,763,000	6,180,000
Apples, bu.	20,034,000	35,532,000	28,469,000
Pears, bu.	5,874,000	5,703,000	7,153,000
Cherries, tons	19,100	20,750	31,620
Peaches, bu.	810,000	135,000	2,387,000
Strawberries (crates)	840,000	792,000	614,000

Source: U.S. Department of Agriculture.

Manufacturing and Trade.—In 1950 the value added by manufacture was $1,113,362,000, in contrast to $926,630,000 in 1949 and $874,036,000 in 1947. There were 6,022 establishments subject to unemployment compensation in 1951.

Table II.—*Principal Industries of Washington*

Industry	Pay roll (for 12-month period ending Sept. 30, 1950)
Logging and lumber products	$137,600,000
Food products	81,100,000
Aircraft	72,100,000
Plywood, millwork, etc.	56,900,000
Pulp and paper	53,300,000
Chemical (including Hanford)	41,500,000
Basic nonferrous metals	25,100,000
Machinery	19,700,000
Fabricated products (metal)	17,700,000
Furniture	11,400,000

The output of lumber in 1950 was 3,817,000,000 bd. ft. (estimated); pulp and paper production 1,868,000 tons (estimated); and plywood production for the Pacific Northwest was 2,579,000 sq.ft. (estimated).

In 1950 commercial fisheries reported a total production of 151,382,450 lb., of which the salmon catch of 43,538,788 lb. had a wholesale value of $27,816,675.

During the period of Oct. 1950 through Sept. 1951, the Washington customs district reported total exports of $215,710,038 and imports for consumption of $228,932,734. (H. J. De.)

Table III.—*Mineral Production of Washington*

(In short tons, except as noted)

	1950		1949	
	Quantity	Value	Quantity	Value
Clays	216,886	$ 251,850	219,738	$ 267,300
Coal	873,989	5,828,555	899,046	6,028,636
Copper	5,057	2,103,712	5,275	2,078,350
Gold (oz.)	92,117	3,224,095	71,994	2,519,790
Lead	10,334	2,790,180	6,417	2,027,772

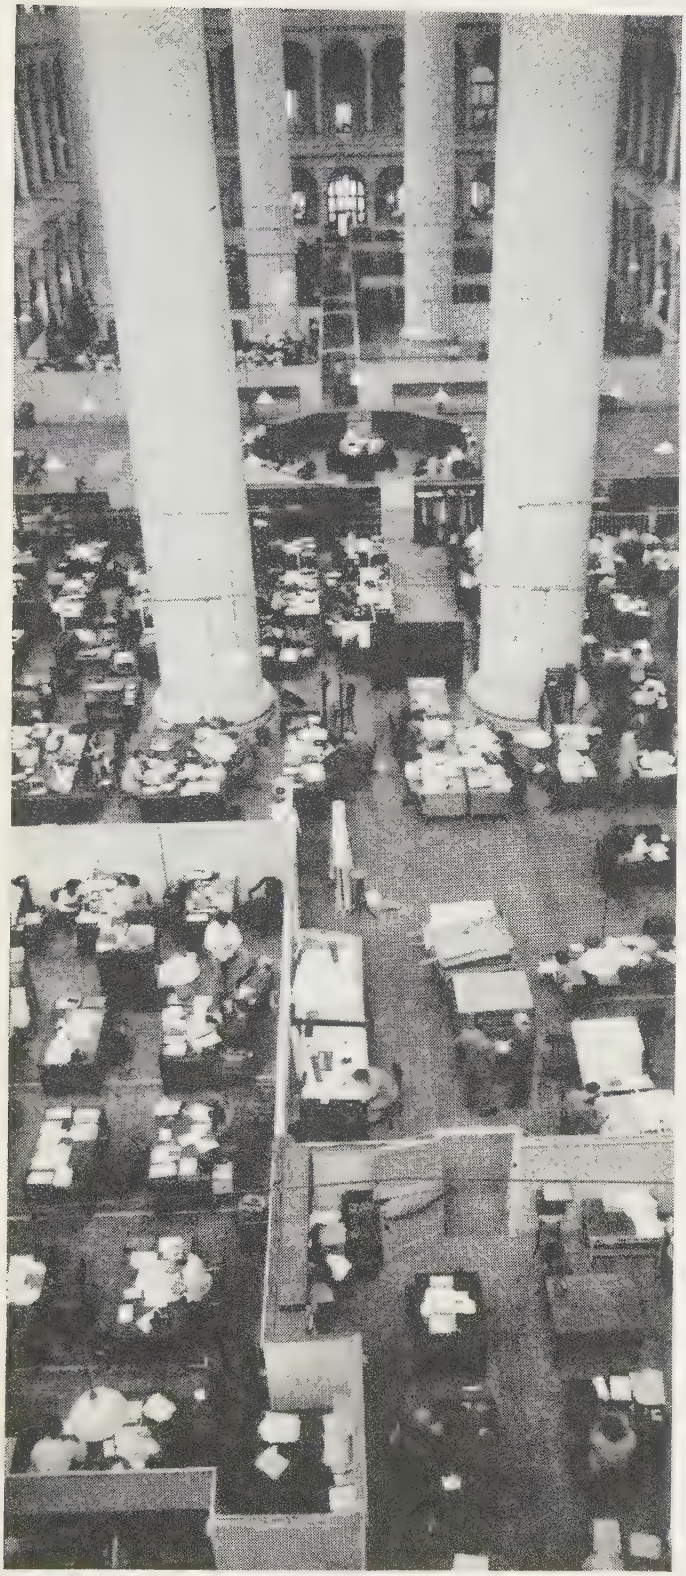
Other minerals	...	?	...	14,456,398
Total		?		$40,862,569

Mineral Production.—Table III shows the tonnage and value of mineral production of the state in 1949 for commodities having values in excess of $100,000 and corresponding data for 1950, so far as they were available at the end of 1951.

Washington, DISTRICT OF COLUMBIA, national capital of the United States, had by the 1950 census a population of 802,178, making it the 9th U.S. city in population and the 11th among the urbanized areas. The very young and the very old increased in numbers more than the total population, and for every 100 women there were 89 men in the district. The nonwhite population had doubled in the decade 1940–50. The federal government in 1951 owned 42.4% of the District of Columbia, with an estimated assessed value of $826,590,307, or 29% of the assessed value of all property in the district, although the federal government, which pays no taxes, had in recent years paid less than 10% of the expenses of the district. In Dec. 1951 the commissioners of the district presented to the bureau of the budget a plan to reorganize the district agencies in the interest of efficiency. The home-rule proposals encountered constitutional complications and failed to pass congress.



INQUIRY CENTRE for defense production operating in a hall of the former Pension Office building in crowded Washington, D.C., during 1951. The hall was once used as a ballroom for celebrating presidential inaugurations

The national capital park and planning commission in 1951 issued five reports following the general summary of the comprehensive plan made public in Dec. 1950. They covered: people and the land; housing in relation to the comprehensive plan; open spaces and community services; moving people and goods; and regional aspects of the comprehensive plan. The planning commission prepared and submitted to the bureau of the budget suggested legislation to strengthen planning for the district and surrounding national capital region. It proposed the appointment of an advisory regional planning council to work with the reorganized national capital planning commission.

Alexandria, at the southern tip of Arlington county, was permitted by the Virginia supreme court of appeals to annex 7.65 sq.mi. from Fairfax county, enabling the city to double in size.

The proposal to disperse new federal buildings throughout the national capital area caused local planning agencies to inquire how housing, schools and other public facilities would be financed in districts where taxpaying property was reduced by new federal holdings.

The District of Columbia Redevelopment Land agency had selected a district in southwest Washington for rehabilitation. By the end of 1951, the extensive repairs and improvements to the White House were almost completed so that the president was expected to resume residence in the executive mansion early in 1952. (H. Js.)

Wealth and Income, Distribution of.

The 1951 *Survey of Consumer Finances* in the United States, published by the board of governors of the federal reserve system, supplied information on the U.S. distribution of income in 1950 and liquid assets in early 1951. The surveys were based on small field canvasses of consumer spending units, defined as all persons living in the same dwelling and related by blood, marriage or adoption who pooled their incomes for their major items of expense.

Survey data on the percentage distribution of spending units according to size of holdings of liquid assets—U.S. government bonds, savings accounts and checking accounts—are provided in Table I. It may be seen that from 1950 to 1951 the proportion of spending units with medium sized holdings ($200–$1,999) showed a marked increase—from 31% to 37%. On the other hand, the percentage with large holdings ($2,000 or more) declined from 22% to 19%. The proportion of spending units having no liquid assets showed a decline (from 31% in 1950 to 28% in 1951) which reversed an increase in evidence since the end of World War II.

Table I.—*Distribution of Spending Units by Size of Liquid Asset Holdings*

(Per cent)

Amounts of liquid assets held*	1946	1947	1948	1949	1950	1951
None	24%	24%	27%	29%	31%	28%

to size of income. The 1950 data revealed a resumption of the upward movement in the post-World War II income distribution which had been arrested during 1949, a year of minor economic recession. The postwar expansion of total money income resulted in a shifting of many consumers to higher income levels. This shifting pervaded the entire income distribution. It was found that when the nation's spending units were ranked into tenths by size of income the proportionate shares of total money income received by each tenth were almost the same in 1950 as in 1945. Within the period, however, the percentage of income received by the highest tenth rose to a peak of 33 in 1947 and then decreased steadily to 29 in 1950.

Source: United States Department of Commerce.

A longer-term comparison of changes in the distribution of income was afforded by Table III. From 1935–36 to 1950 there was a redistribution of income in the United States away from the highest income bracket. The second, third and fourth income brackets significantly improved their relative positions, whereas the percentage of total money income received by the highest bracket declined from 53 to 46.

State Distribution of Income.—Income payments to individuals expanded in every state in 1950, the latest year for which department of commerce estimates were available in 1951. Against the setting of a generally expansionary economic situation, total income moved up in most sections of the country at rates similar to the 11% rise for the country as a whole.

The largest regional gain, 14%, was scored by the northwest (*see* Table IV). The smallest gain, 8%, occurred in the southwest. In both of these regions, the 1949–50 change in total income was materially affected by large fluctuations in agricultural income. In respect to the flow of nonagricultural income, the northwest's 11% rise matched the nation-wide rate, whereas the southwest's 13% advance exceeded it and was the highest of any region.

For the country as a whole, per capita income payments (total income divided by total population) were $1,436 in 1950. On a state basis, per capita incomes ranged from $698 in Mississippi to more than $1,900 in Delaware and the District of Columbia. Others in the top rank included Nevada ($1,875), New York ($1,864), Connecticut ($1,766), Illinois ($1,752) and California ($1,751). Average income levels were lowest in the south, where all 15 states, along with Maine, Vermont and West Virginia, were grouped at the bottom of the per capita income array.

Despite the substantial progress they had made over the past two decades, the southern states in 1950 had a composite per capita income 36% below the average for all other states.

From 1940 to 1950, a decade of tremendous economic growth, there was a pronounced relative shift of total income from the New England and middle east regions to the south and west. As shown in Table IV, the rates of income expansion in the southwest, southeast, far west and northwest substantially exceeded the nation-wide rise of 186%, whereas the gains in New England and the middle east fell far short of it. The proportionate share of the nation's total income received by the four regions of the south and west increased 18% from 1940 to 1950, whereas that of the northeastern area (New England and middle east) declined 14%.

However, aggregate income in the northeast in 1950 still accounted for more than one-third of the national total. (*See* also INCOME AND PRODUCT, U.S.) (C. F. Sz.)

United Kingdom.—The White Paper on national income published in April 1951 gave the distribution of incomes for 1949. To supplement the figures given there, the total number of income recipients had to be estimated and from that the number with incomes under £250 was deduced. As in previous years, no details were available for the distribution of incomes within

Table V.—*Distribution of Incomes in the United Kingdom, 1949*

Range of incomes (in £)	Number of incomes (in thousands)	Amount of income before tax (in million £)	Amount of income after income tax and surtax (in million £)
Under 250	(10,200)*	2,209	2,185
250– 500	10,310	3,546	3,360
500– 1,000	2,443	1,614	1,375
1,000– 2,000	545	728	539
2,000–10,000	219	760	436
10,000 and over	11	190	44
Total	(23,700)*	9,047	7,939
Unallocated private income†		1,664	997
	Total	10,711	8,936

*Figures in parentheses are private estimates. Figures will not add because of rounding.

†Including undistributed profits, interest on savings certificates, dividends of co-operative societies, income in kind, income of nonprofitmaking bodies, etc.

Source: *National Income and Expenditure of the United Kingdom, 1946 to 1950.* (Cmd. 8203, H.M.S.O., London, 1951).

the lowest group, which still comprised more than 40% of the income recipients.

As a result of rising wage rates, a further shift took place from the lower to middle income groups. The number with incomes under £250 fell by almost 2,000,000 compared with 1948, but only about 150,000 crossed the £500 limit. In the higher ranges of income the numbers remained almost unchanged. Hardly any change was recorded in the relative incidence of income taxation. Taxes remained low (under 5% of income) up to an income of £500, but they reduced incomes by one-quarter in the range £1,000–£2,000, by nearly one-half in the range £2,000–£10,000 and by more than three-quarters in the range above £10,000. Compared with 1948, receipts from indirect taxes and expenditure on price subsidies were diminished in approximately equal amounts. Tax liabilities, both direct and indirect, offset by price subsidies, were still at their post-World War II peak of 28% of personal incomes. Comparing the distribution for 1949 with that for the prewar year 1938, it appeared that the share of the richest 11%–12% in taxable personal incomes was reduced from 41% to 33% and that of the richest 3.5% from 26% to 19%; taking incomes after taxation, these reductions were from 36% to 27% for the former class and from 21% to 13% for the latter. West Virginia.

The 25th state to enter the Union, West Virginia was admitted conditionally on Dec. 31, 1862, and was proclaimed a separate state on April 20, 1863, effective 60 days later. It has an area of 24,181 sq.mi., of which about 101 sq.mi. are water surface. In 1950 the population was 2,005,552, or only 5.4% more than in 1940. Charleston, the capital, had a 1950 population of 73,501. Other cities of 10,000 or more population were: Huntington, 86,353; Wheeling, 58,891; Clarksburg 32,014; Parkersburg, 29,684; Fairmont, 29,346; Morgantown, 25,525; Weirton, 24,005; Bluefield, 21,506; Beckley, 19,397; South Charleston, 16,686; Martinsburg, 15,621; and Moundsville, 14,772.

The urban population of the state was 694,487, or 34.6% of the total.

History.—The state officers in 1951, all Democrats, were: governor, Okey L. Patteson; secretary of state, D. Pitt O'Brien; auditor, Edgar B. Sims; treasurer, William H. Ansel, Jr.; attorney general, William C. Marland; state superintendent of free schools, William W. Trent; and commissioner of agriculture, J. Blaine McLaughlin. Important acts of the 50th legislature in a 60-day regular session included the following: a bond issue of $90,000,000 to raise funds for cash bonuses to resident veterans of World War I and World War II and levy of additional tax on alcoholic beverages, non-intoxicating beer and cigarettes to pay for the issue over a period of 20 years; establishment of schools of medicine, dentistry and nursing as parts of the state university and levy of a tax on soft drinks to finance it; amendment of the motor vehicles law and fixing of financial responsibility of owners and operators involved in accidents; redistricting of the state for the purpose of electing members of the house of delegates (increased from 94 to 100), state senators and members of congress; and increasing of the number of judicial districts in the state from 24 to 27.

Education.—In 1950–51 the total net enrolment of the 3,895 elementary schools was 299,390. For the 385 high schools (junior and senior) it was 143,745. There were 10,497 elementary and 5,747 secondary teachers. Total receipts for the public school program were $68,446,781.88. There were nine state-supported institutions of higher learning under control of the state board of education, which had a total enrolment in the first semester of 1950–51 of 7,345, of whom 851 were veterans, and a total teaching staff of 544. The state university at Morgantown and Potomac State school at Keyser, a junior college, were under control of a board of governors.

Social Insurance and Assistance, Public Welfare and Related Programs.—In the year ending June 30, 1951, the total expenditures of the state department of health were $2,305,737.93, of which $881,367.18 were federal funds. The federal funds were used primarily in aid of special programs, such as cancer, tuberculosis, mental hygiene, venereal disease and heart disease control. Regular expenditures of the department of public assistance totalled $21,426,325, of which $8,510,052 was for old-age assistance; $398,006, aid to the blind; $12,480,265, aid to dependent children; and $37,999, aid to permanently and totally disabled persons. General relief items and the respective total expenditures were: crippled children, $470,688.66; medical and hospital aid, $1,156,839.53; correction of vision and prevention of blindness, $15,690.47; child welfare, $64,569.79; general assistance, $1,586,928.96; and boarding care, $677,408.23.

A total of $1,653,745.82 was spent for personal service, current expense and equipment.

Communication and Transportation.—There were 32,122 mi. of primary and secondary roads. Total highway income for the fiscal year ending June 30, 1951, was $52,764,000. On Nov. 1, 1951, there were 322,716 Bell telephones and 44,740 (Jan. 1) on lines of connecting companies.

Banking and Finance.—On June 30, 1951, deposits in 106 state banks and trust companies totalled $445,537,131.66, and those of 74 national banks $503,331,000. Resources of 21 federal savings and loan associations were $51,224,708.12; of 16 state building and loan associations $14,856,036.80; and of 26 industrial loan companies $18,398,546.56. There were 125 small loan companies with total resources of $25,600,183.02 and loans of $22,039,152.98, and 26 state-chartered credit unions had total resources of $894,106.99 and loans of $771,078.67.

Total state receipts for 1950–51 were $268,780,031.91, and the cash balance, as of June 30, 1951, was $43,732,649.13. The total disbursements for 1950–51 were $271,461,973.04, but the unencumbered balance in the state fund, general revenue, as of June 30, 1951, was only $4,908,751.88. Total bonded indebtedness of the state, as of July 2, 1951, was $79,702,000, and the total assessed valuation of property was $2,640,106,157.

Agriculture.—The total gross farm income for 1950 was $167,601,000. Of this total $2,050,000 was government payments, $25,974,000 was from crops and $89,879,000 was from livestock and livestock products, sold and traded. The estimated value of products consumed on farms where produced was $49,698,000 which left a net cash income of $117,903,000 or $1,597,000 more than in 1949. The only crops with increased acreage in 1950 were hays and barley. On Jan. 1, 1951, there were more cattle and sheep in the state than a year earlier, but fewer hogs, horses and chickens.

Table I.—*Principal Agricultural Products of West Virginia*

Crop	1951	1950	Average, 1940–49
Corn, bu.	8,580,000	8,806,000	11,804,000
Wheat, bu.	1,073,000	1,221,000	1,550,000
Oats, bu.	1,600,000	1,590,000	1,750,000
Buckwheat bu.	114,000	123,000	176,000
Hay (all), tons	1,048,000	1,011,000	986,000
Apples (commercial), bu.	3,654,000	4,260,000	3,779,000
Potatoes (Irish), bu.	1,575,000	1,785,000	2,942,000
Barley, bu..	286,000	406,000	274,000
Tobacco, lb.	4,030,000	3,379,000	3,208,000
Peaches, bu.	607,000	557,000	539,000

Source: U. S. Department of Agriculture.

Industry.—In 1950–51 industry and business employed 532,340 persons, not including about 85,000 in agriculture, 36,000 in professional services, 23,000 in domestic service and 8,500 in finance, insurance and real estate. Those employed in industry and business earned an average of $2,904, or 14.1% more than in 1949–50, and a grand total of $1,545,720,000, or 20.7% more than in 1949–50. (C. H. A.)

Mineral Production.—Table II shows the tonnage and value of mineral production in the state in 1949 for commodities having values in excess of $100,000, and corresponding data for 1950, so far as they were available at the end of 1951. West Virginia ranks fourth among the states in value of mineral production and first in coal.

Table II.—*Mineral Production of West Virginia*

(In short tons, except as noted)

Mineral	1950 Quantity	1950 Value	1949 Quantity	1949 Value
Clays	569,615	$ 925,305	477,503	$ 759,065
Coal	144,115,683	754,370,245	122,610,578	649,696,884
Coke*	3,690,935	40,765,301	3,359,965	36,906,180
Lime	?	?	350,311	3,535,352
Natural gas (thousand cu.ft.)	170,100,000	28,236,000	181,176,000	29,296,000
Natural gasoline (gal.)	46,662,000	3,148,000	41,880,000	2,945,000
Petroleum (bbl.)	2,788,000	9,280,000	2,839,000	8,770,000
Petroleum gases (gal.)	152,745,000	4,262,000	116,060,000	3,591,000
Salt	367,942	1,238,588	355,515	1,288,471

Whaling: *see* FISHERIES.

Wheat. The 1951 U.S. wheat crop of 987,474,000 bu. was 3% smaller than the 1950 crop and less than 1,000,000,000 bu. for the first time since 1943. There were 78,059,000 ac. planted, compared with 71,287,000 ac. for the 1950 crop. However, because of damage by winter kill, insects and disease, plus abnormally wet weather at harvest time, only 61,424,000 ac. were harvested, compared with 61,610,000 ac. harvested in 1950. The yield per acre was 16.1 bu., compared with 16.5 bu. in 1950 and an average for 1940–49 of 17.1 bu. per acre.

The winter wheat crop of 645,469,000 bu. was smaller than the 740,682,000 bu. of 1950, the 1949 crop of 895,101,000 bu., or the 1940–49 average of 791,764,000 bu. Unfavourable factors hit this part of the crop hard, reducing the 55,802,000 ac. planted in the fall of 1950 to 39,762,000 ac. harvested. The average yield was 16.2 bu. per acre; that of 1950 was 17.1 bu. and the ten-year average was 17.7 bu.

An excellent spring wheat crop of 342,005.000 bu., compared with 278,707,000 bu. in 1950 and an average for 1940–49 of 279,546,000 bu., partly balanced the lower outturn of winter wheat. Expansion in acreage planted to 22,257,000 ac. from only 18,888,000 ac. in 1950 and an official "guide" of 21,400,000 ac., accounted for much of the increase. Only 595,000 planted acres were not harvested. The average yield of 15.8 bu. per acre was higher than the 15.2 bu. of 1950 and slightly above the 15.7 bu. average for 1940–49.

Table I.—*U.S. Wheat Production by Leading States*

(In thousands of bushels)

State	1951	1950	Average, 1940–49
North Dakota	150,975	123,986	137,943
Kansas	126,113	178,060	193,512
Montana	97,988	91,434	68,845
Washington	75,152	69,692	61,580
Nebraska	58,073	88,482	63,652
South Dakota	57,260	33,488	41,358
Oklahoma	38,902	42,363	73,998
Idaho	37,968	37,087	31,154
Colorado	34,967	36,909	35,996
Ohio	34,308	46,596	46,592
Illinois	33,383	27,632	28,879
Michigan	30,800	29,666	23,553
Oregon	28,999	23,693	22,666
Indiana	23,529	32,193	29,529
Missouri	22,406	23,782	22,658
Minnesota	20,022	15,512	22,004
Pennsylvania	18,832	18,986	18,440
Texas	17,307	18,992	63,486
New York	10,319	11,344	8,367
California	9,741	13,671	10,969
Utah	9,081	7,840	6,937

The durum type crop of spring wheat amounted to 35,820,000 bu., compared with more than 37,000,000 bu. in 1950. A reduction in harvested acreage to 2,518,000, 11% below 1950, more than offset the yield of 14.2 bu., one bushel per acre more than in 1950.

Hard red winter wheat continued, as in past years, to be the most abundant class with 381,964,000 bu., but it declined sharply, compared with the 508,595,000 bu. average for 1940–49. Hard red spring wheat (264,024,000 bu.) was more abundant than the 208,885,000 bu. of 1950 or the average for the previous decade. The white wheat of the Pacific northwest (154,166,000 bu.) was slightly more abundant even than in 1950 and well above the average 115,380,000 bu. of 1940–49. Soft red winter wheat, produced mostly east of the Great Plains, with 150,748,000 bu. was somewhat less abundant than in 1950, definitely so compared with the 200,694,000 bu. average for 1940–49.

United States exports of wheat and wheat flour in 1950–51 were 373,810,000 bu. valued at $747,923,000 compared with 314,231,000 bu. valued at $683,596,000 in the preceding year. The U.S. export quota of 235,858,000 bu. for 1950–51 under the International Wheat Agreement was exhausted four months before the end of the year and the subsidy provided amounted to about $182,000,000 compared with only $77,000,000 in the previous year. In late Dec. 1951 U.S. sales under the agreement were progressing rapidly, having reached nearly 200,000,000 bu. of a quota of 255,149,000 bu. for the year to end July 31, 1952. The subsidy was averaging about 75 cents per bushel. It was estimated that total wheat exports, under and outside the quota, would probably reach 365,000,000 bu., about the same as in 1950–51.

In summary, the U.S. supply included a carry-over of about 396,000,000 bu., a crop of 987,474,000 bu. and probable imports of 40,000,000 bu. of feed wheat from Canada, a total supply of about 1,425,000,000 bu., of which 500,000,000 bu. would be used for food, 140,000,000 bu. for feed, 90,000,000 bu. for seed and industrial processing and 365,000,000 bu. for export, leaving probable carry-over stocks by June 30, 1952, of about 335,000,000 bu.

Wheat prices remained moderately near the support levels prior to June, but as the U.S. winter wheat crop deteriorated and the later Canadian crop proved difficult to harvest and importing countries became more anxious, prices moved to the highest levels since 1948, reaching about $2.70 per bushel (at Chicago, Ill.)

The question of providing 2,000,000 tons of grain, much of it wheat, to India to alleviate famine was discussed for several months before the United States in June agreed to lend India $190,000,000 under special and easy credit terms for the purchase of such foodstuffs. The U.S.S.R. scaled its original offer of 500,000 tons of wheat to 100,000 tons, to apply against Indian export goods.

A large 1951 world wheat crop of 6,550,000,000 bu. was indicated notwithstanding some late decline in outturn in Canada and the U.S. resulting from a wet and delayed harvest, and in southern hemisphere areas because of drought.

In spite of the large size of the 1951 crop, the distribution indicated an increased deficit margin in the heavy importing areas of western Europe and an increased concentration of surplus supplies in North America, particularly in Canada. The decline of the southern hemisphere in export potential was marked. The U.S.S.R. crop, though moderately hit by drought, was thought to have been somewhat larger than the 1,110,000,000 bu. of 1950 since there was an expansion in acreage, partly at the expense of rye. Britain expected to get 200,000 tons of wheat from the U.S.S.R. as a result of an agreement signed in September.

World trade in wheat and flour in 1951–52 was expected to total about 900,000,000 bu., slightly more than during the previous year. Stocks carried over on July 1, 1951, were about 800,000,000 bu. Canada, with 225,000,000 bu. of that total plus a near record harvest, appeared to be in a position to supply a large percentage of the trade in the spring and summer of 1952.

Table II.—*World Wheat Production for Selected Areas**

(In millions of bushels)

Country	1951	950	1949	Average, 1935–39
United States	987	1,019	1,141	759
Canada	562	462	371	312
Mexico	14	20	18	14
Europe	1,580	1,525	1,500	1,599
Great Britain	82	97	82	62
North Africa	75	87	84	73
Union of South Africa	24	26	15	16
Asia	1,630	1,535	1,410	1,498
Indian Union	232	288	204	262
Pakistan	148	148	153	117
Argentina	125	213	189	222
Australia	155	184	218	170
U.S.S.R.	.....	1,110	1,100	1,240
World total	6,545	6,317	6,185	6,024

*Revised estimates by the U.S. Department of Agriculture on basis of incomplete reports from several countries with adjustments for year of harvest, and including allowance for missing data and forecasts for crops being harvested.

In July 1951 an official U.S. production goal was established for a 1952 wheat harvest of 1,165,000,000 bu. from about 78,850,000 ac., a production which, if attained, would be sufficient to meet anticipated domestic and export demands and add about 100,000,000 bu. to the carry-over. The price support for 1952 crop wheat was announced to be not less than $2.17 per bushel.

At the end of 1951 it was estimated that 56,257,000 ac. had been seeded to winter wheat for harvest in 1952, about 1% more than the large acreage seeded in the fall of 1950. The condition (88%) of the new crop in Dec. 1951 permitted a forecast of a 918,000,000 bu. crop which, with a normal spring wheat crop, would fully meet the production goal. (*See* also FLOUR.)

(J. K. R.)

Wildlife Conservation. Problems of wildlife conservation in the United States during 1951 were dramatized by the plight of the diminutive key deer, not more than 50 of which still survived on the coral islands extending from the Florida mainland to Key West. Victims of poachers, motorists and fire, these tiny deer could be saved only by a federal refuge. Legislation to this end failed of passage during 1951, and conservation organizations stepped in to seek protection of the animals temporarily through contributions to the key deer fund established by the National Wildlife federation.

Migratory waterfowl, as always, held an important position in wildlife management and conservation. A good breeding season in 1951 resulted in slight liberalization of the waterfowl hunting regulations. The length of the open season was increased by five days in the Atlantic, central and Pacific flyway states, and by ten days in the Mississippi flyway states. Bag limits and possession limits remained the same.

Important in waterfowl management was the enactment of a law authorizing expenditure for law enforcement of 15% of the annual income from the sale of the federal stamp required on all waterfowl hunting licences. The fish and wildlife service estimated that the illegal kill of ducks and geese amounted to about 20% of the legal kill. The new law was expected to produce about $200,000 more to bring the enforcement staff to 120 men.

Emphasis on restoration and improvement of habitat featured the Federal Aid in Wildlife Restoration program under the Pittman-Robertson act, which provided for the use, in behalf of wildlife, of income from the federal excise tax on sporting arms and ammunition. The fiscal year ending June 30, 1951, showed a sum of $17,846,423 available for this wildlife conservation work. This had to be matched by a 25% contribution from the states to carry out approved projects.

Enactment of the Dingell-Johnson act provided for use of a similar formula for fisheries restoration, the excise tax on sport fishing equipment being earmarked for this purpose. About $2,900,000 of federal funds thus became available for this conservation activity.

Among the research programs looking to sounder management of wildlife resources were continued studies of migratory waterfowl as a basis for hunting regulations; investigation of the possibilities of introducing certain foreign species of game birds into depleted areas in the United States; study of the problem of trichomoniasis, a disease of the throat of mourning doves that had caused extensive losses in the southeast; investigation of the effects of repellent chemicals on birds, mammals, fishes and other wildlife forms.

Integrity of the national wildlife refuge system, a major factor in protecting an adequate breeding stock of migratory waterfowl and certain big game animals, was challenged to some degree by demands for the use of these areas for other purposes, principally national defense. Two important additions to the refuge program were made, one in Palm Beach county, Fla., and the other in the San Joaquin valley of California. (*See* also NATIONAL PARKS AND MONUMENTS.)

CONDORS, rare birds of which fewer than 100 remained in the U.S. in 1951, shown at a 10,000-ac. refuge set up for them during the year by the U.S. department of the interior in the Los Padres National forest, Calif. Condors are not prolific, laying only one egg in four years

BIBLIOGRAPHY.—*Wildlife Review*, a periodical listing books, articles in journals, and other publications (U.S. Department of the Interior); *Audubon Magazine, Nature Magazine, Outdoor America, Journal of Wildlife Management, The Auk: A Quarterly Journal of Ornithology* (periodicals). (H. Z.)

Canada.—The federal government amended the Migratory Birds Convention act to extend the powers of a game officer to seize motor vehicles or aircraft used in violation of the act or of regulations based upon the act. Discovering that bounties for the killing of harbour seals and sea lions, which destroy commercial salmon, were not the answer to the problem of controlling those predators, the federal government moved toward direct action. The fisheries research board reported, after detailed investigations, that lumbering operations and water power development were definitely decreasing the spawning beds for British Columbia salmon, which created a long-range problem in fisheries conservation. The board suggested raising the level of egg production, increasing the growth rate and shortening the period salmon spend in fresh water before going to sea.

The Ontario department of lands and forests convened a conference of its senior conservation officers and departmental biologists, who discussed 116 different wildlife topics. The conference was so successful it was slated as an annual event. The $500,000 southern research station at Maple was rushed to completion, and became one of the most modern and complete centres of its kind in North America devoted to fish, wildlife, tree insects and related studies. (C. Cy.)

Other Countries.—The International Union for the Protection of Nature held a meeting at The Hague, Neth., from Sept. 19–22, 1951. One hundred and thirty people of many nationalities took part.

In Great Britain, negotiations were well advanced for the acquisition or management of a number of reserves. Two large areas of varied moorland, one in Scotland and one in northern England, were shortly to pass into the hands of the Nature Conservancy.

In Uganda, legislation was prepared for the establishment of the four national parks recommended by the National Parks committee. The importance of the preservation of the gorilla was recognized by the inclusion among the parks of the existing gorilla sanctuary adjoining the Parc National Albert in the Belgian Congo. Game in the reserves held its own, but, outside them, fared badly from excessive tribal hunting and poaching.

In Tanganyika, the boundaries of the Serengeti national park were fixed to include an area of 5,670 sq.mi., making a reserve for the last great congregation of East African wild animals. A new and greatly improved game ordinance was drawn up.

In Northern Rhodesia, the controlled area system under which hunting parties were allowed into certain areas under licence and part of the fees paid allotted to the local native authorities, continued to be successfully applied. But it became increasingly obvious that the value of the system depended upon its understanding by African residents, so that they should, in their own interests, limit their demands on the game population.

In Cape Province, South Africa, a new ordinance to protect wildlife came into effect. The export of all kinds of tortoises, other than water tortoises, and all kinds of lizards and chameleons, except under permit, was prohibited. In Natal, the Kamberg nature reserve was established.

The Wild Life Conservation committee appointed by the government of India held its first meeting at Delhi in July 1951. The Bombay state legislature passed the Bombay Wild Animals and Wild Birds Protection act.

In spite of bandit activity in Malaya work on the re-establishment of the King George V national park proceeded. Definite signs of the existence of rhinoceros were seen for the first time since the Japanese occupation.

The government of Singapore set aside six nature reserves, with a total of 14 sq.mi. to preserve the indigenous fauna and flora of the colony. Included were two mangrove areas in the hope that many species of orchids which had disappeared might reappear in the process of regeneration of the mangrove.

In Tasmania, the Animals and Birds Protection board acquired the leases of a number of islands in the Bass strait. These would provide sanctuary for many forms of bird life including the Cape Barren goose. The brush opossum and the ringtail opossum were given complete protection.

In New Zealand, the need for the protection of the native fauna and flora continued to make necessary the reduction of introduced mammals. A campaign was waged particularly against the Australian silver-grey opossum and against red deer, both of which had become a dangerous menace by defoliation of forests. Twenty thousand acres of Waipoua forest, the last substantial kauri forest, were proclaimed a forest sanctuary.

A report was received by the Fauna Preservation society that there still existed in a reserve in Java about 30 specimens of the Javan rhinoceros (*Rhinoceros sondaicus*), probably the world's rarest large animal.

FILMS OF 1951.—*Elk For The Future* (Wild Life Films); *Meet the Ducks* (Associated Screen News Ltd); *Return of the Buffalo* (Skibo Productions). (C. L. Be.)

Wilson, Charles Edward (1886–), U.S. industrialist and government official, was born on Nov. 18 in New York, N.Y. He began working at the General Electric company in New York at the age of 13, meanwhile attending night school. He worked successively in the accounting, production, engineering, manufacturing and marketing departments of General Electric. From 1930 to 1937 he was merchandising department manager and a vice-president; from 1937 to 1939, executive vice-president, and on Jan. 1, 1940, he became president of the company. In Sept. 1942 he became vice-chairman of the War Production board, the top industrial and economic control agency of the World War II emergency administration. In Feb. 1943 he became executive vice-chairman of WPB, serving in that capacity until Feb. 1944.

The outbreak of the Korean war in 1950 impelled Pres. Harry S. Truman to set up a new emergency defense production agency, and Wilson was sworn in as its director on Dec. 21, 1950. In April 1951 he predicted, in an address before the American Newspaper Publishers association, that the U.S. would be able to "meet the demands of all-out war, if need be, out of our production lines," by the end of 1953. In December, after conferring with President Truman, he told reporters that he had not let civilian production interfere with war production, as some critics had charged, but that he would cut civilian production if it interfered with the filling of military requirements.

Windward Islands. The British colonies of Grenada, St. Vincent, St. Lucia and Dominica, forming the southern part of the Lesser Antilles in the Caribbean, constitute the British Windward Islands.

Pop.: 95% Negro; some Caribs on Dominica. Language: English; on Dominica and St. Lucia also French patois. Religion: Christian. Capital towns (pop., 1946 census): St. George's (Grenada, seat of governor, 5,774); Roseau (Dominica, 9,751); Castries (St. Lucia, 7,056); Kingstown (St. Vincent, 4,831). Governor in 1951, Sir Robert Arundell.

	Area (sq. mi.)	Population	
		(1946 census)	(1950 est.)
Grenada	133*	72,387	75,913
St. Vincent	150*	61,647	67,544
St. Lucia	233	70,113	79,511
Dominica	305	47,624	53,964

*Excluding the Grenadines (8 sq.mi.) attached in part to Grenada and in part to St. Vincent.

History.—New constitutions came into operation during 1951 and elections on full adult suffrage were held in October. Elected members had a clear majority over the ex officio and nominated members in the legislative council; and the beginnings of responsible government were seen in the power of the legislative councils to select three of their elected members for the executive councils. There were serious disturbances in Grenada in February and March arising from a strike called by a newly formed trade union. The elections, however, passed off quietly. They resulted in the return of candidates who supported the leader of the new trade union to six out of the eight available seats in the legislative council. In St. Vincent, all eight seats were captured by members of another newly established union.

In Grenada the cocoa rehabilitation scheme financed by colonial development funds made good progress, as did the superfine sea island cotton industry in St. Vincent. A coconut oil processing factory was set up in St. Vincent; in Dominica, the least developed of the four colonies, both the banana-growing and fruit-canning industries took steps forward. The rebuilding of Castries, capital of St. Lucia, which was practically destroyed by fire in 1948, proceeded steadily after delays caused by a shortage of steel.

Education.—Average school attendance (1950): Grenada 12,638; St. Vincent 9,414; St. Lucia 8,391; Dominica 6,729.

Finance and Trade.—Currency, British Caribbean dollar valued at 58.33 cents U.S. Values in the table are in British Caribbean dollars.

	Budget (1951 est.)		Foreign Trade (1950)	
	Revenue*	Expenditure*	Imports	Exports
Grenada	$2,848,000	$2,827,000	$6,024,321	$7,020,826
St. Vincent	1,945,613	2,264,740	3,941,997	2,114,134
St. Lucia	2,080,221	1,936,995	4,746,784	2,088,835
Dominica	1,398,000	1,516,063	4,205,854	2,183,732

*Excluding grants-in-aid and colonial development expenditure.

Principal exports: arrowroot, bananas, citrus products, cocoa, copra, sea island cotton, mace and nutmegs, sugar. (P. H-My.)

Wines.

Total world wine production for 1951 amounted to 4,973,800,000 gal. according to official reports and estimates compared with 5,313,200,000 gal. for 1950 (a more accurate figure) or an over-all decrease of 439,400,000 gal. Some figures, notably those from soviet-influenced countries, were pure estimates.

World Production of Wine

(Millions of gallons)

Country	1951	1950	Average		Quality 1951
Algeria	362.8	377.7	450.6	(1935–39)	
Argentina	290.4	330.0	183.0	(1935–44)	Poor

U.S.A.	168.0	136.3	102.5	(1940–45)	No variation
U.S.S.R.	273.0	273.0	....		
Yugoslavia	100.0	136.1	124.6	(1935–39)	
Total	4,973.8	5,313.2			

Countries like the United States, marked "No variation" in the above table, produce uniform wines from year to year because of stable climatic conditions and methods of production used.

France was the largest producer of wine in 1951. The total production of famous growth (*Appelation contrôlée*) wines amounted to 116,000,000 gal. compared with a total of 175,000,000 gal. in 1950. The famous growths of Burgundy and Rhône produced 18,700,000 gal. against 28,800,000 gal. the previous year, the quality being weak, and Bordeaux 24,700,000 gal. of disappointing quality compared with the 1950 yield of 83,800,000 gal. Champagne production was 5,490,000 gal., only ⅔ of the ten-year average and of mediocre quality. During 1951 government control continued to stabilize wine prices which started falling in 1949. Algerian production was off 4% from 1950.

In Spain, the Jerez district produced 10,560,000 gal. of magnificent quality sherry against the normal quantity of 9,250,000 gal. the previous year. Of the Portuguese wines, port wine, controlled to world demand, was held to 5,841,000 gal.

United States production was estimated to be ahead of 1950 for a new record production. About 90% of the production was from California.

United States consumption of imported table wines and vermouth in 1951 was at the highest level since the repeal of prohibition.

Because of higher labour costs and inflationary pressures, prices of European wines were sharply advanced. (J. We.)

Wisconsin.

One of the north central states of the United States, Wisconsin, popularly called the "Badger state," entered the union as the 30th state in 1848. Area: 56,154 sq.mi., of which 1,449 sq.mi. are water. Pop. (1950 census) 3,434,575, an increase of 9.5% since the census of 1940. Capital, Madison (1950 census, 96,056). Milwaukee (637,392) is the largest city. Other large cities are Racine (71,193), Kenosha (54,368), Green Bay (52,735) and La Crosse (47,535).

History.—The biennial session of the legislature enacted a substantial body of important legislation during 1951. It increased the maximum old-age pensions from $50 to $75 a month, increased educational benefits and pensions for teachers, raised the maximum veterans' housing loan limit to $3,500 on a $15,000 instead of a $10,000 house, added $4,000,000 to the veterans' rehabilitation trust fund, appropriated $15,120,000 for state building construction, raised all state salaries substantially, passed a record-breaking $211,844,000 biennial budget and at the same time reduced taxes, repealing the 25% surtax on incomes and the 3% dividend tax. Unemployment compensation benefits were raised from a maximum of $26 a week to $30; the workmen's compensation maximum from $46 a week to $52.86. The controversial problem of reapportionment of legislative representation was the most hotly debated measure of the session. Reapportionment on the basis of the population totals for each federal census, required by the state constitution, had not been carried out since 1931. A study by a civilian-legislative committee headed by the retired chief justice, Marvin B. Rosenberry, produced the so-called Rosenberry bill, providing for reapportionment in accordance with population. This became an administration measure. The legislature finally provided that the Rosenberry bill would become law Jan. 1, 1954, if a proposed constitutional amendment to provide for reapportionment on a combined area-population basis were rejected by popular referendum at the Nov. 1952 election.

State officers continued without change: Walter J. Kohler, Jr. (R), governor; George M. Smith (R), lieutenant governor; Fred R. Zimmerman (R), secretary of state; Warren R. Smith (R), state treasurer; Vernon W. Thomson (R), attorney general; George F. Watson, superintendent of public instruction.

Education.—There were 5,641 elementary and approximately 445 secondary schools, 23 county normal schools and 9 teachers' colleges in 1950–51. Elementary school enrolment totalled 354,285; in secondary schools it was 145,499. The county normal schools had 1,099 students. Teachers in the elementary schools numbered 14,045; in secondary schools 6,352; in the county normal schools 96. The teachers' colleges employed 610 faculty members to teach 10,330 college and 2,303 training school students. The 1951 Wisconsin legislature changed the name of the teachers' colleges to "state colleges." State aid for education in the elementary and secondary schools for the fiscal year 1949–50 amounted to $18,401,567. Total expenditures in all elementary and secondary schools were $120,531,125.

Social Insurance and Assistance, Public Welfare and Related Programs.—The number of cases receiving public assistance as of June 30, 1951, was as follows: general relief 5,517; old-age assistance 52,075; aid to the blind 1,374; aid to totally and permanently disabled 764; dependent children in their own or a relative's home 8,784; dependent children in foster homes 1,534—a total of 70,048 households. Expenditures for public assistance in the year ending June 30, 1951, were: general relief $4,692,305; old-age assistance $30,975,919; aid to the blind $874,556; aid to the totally and permanently disabled $609,784; aid to dependent children in their own or a relative's home $11,714,444; aid to dependent children in foster homes $765,957—making a grand total of $49,632,965. Civilian unemployment benefits during the calendar year 1951 were $7,358,355 as against $13,061,617 in 1950 and $19,626,899 in 1949. The contributions on pay rolls for 1950 totalled $14,115,733 as compared with $12,909,761 in 1949 and $10,788,433 in 1948.

Wisconsin's 12 charitable, mental and correctional institutions were operated at a cost of $10,559,226 during the fiscal year 1950–51. The average daily population for June 1951 was 10,144.

Communications.—Public highways as of Jan. 1, 1951, totalled 94,728 mi. divided as follows: 85,825 (towns), 2,511 (villages) and 6,392 (cities). Expenditures by the highway commission during the fiscal year amounted to $67,532,014. Railway mileage (steam and electric) as of Dec. 31, 1950, was 6,612.6, with 65.91 mi. of trolley coach route (trackless). There were 981,456 telephones, and on Sept. 1, 1951, there were 156 airports and 13 seaplane bases.

Banking and Finance.—At the end of the year 1950 there were 95 national banks and 461 state banks. National banks had deposits of $1,500,024,000 and assets totalling $1,600,230,000. Deposits in state banks amounted to $1,617,421,279, and their assets were $1,733,658,543. Credit unions increased from 534 in 1949 to 542 in 1950, and listed assets of $42,875,076. Assets of the 113 savings and loan associations totalled $263,408,389.

State receipts for the fiscal year ending June 30, 1951, were $231,193,403; disbursements totalled $226,926,523. Taxes collected by the state and returned to local subdivisions amounted to $64,106,476; agency collections returned to counties $2,277,526; state aids $69,508,910; transferred to other funds (building fund, retirement fund, veterans' fund, etc.) from the general fund $19,071,560.

Agriculture.—Total acreage harvested in 1951 was 10,125,700, slightly less than that in 1950. Cash receipts in 1950 amounted to $968,910,000, consisting of $851,737,000 from livestock and livestock products and $117,173,000 from crops. Crop yields for 1951 on the whole were as good as or better than average in spite of unusual weather conditions throughout the crop season. Latest census figures showed a decrease in the number of farms but an increase in their size.

Table I.—*Principal Crops of Wisconsin*

Crop	1951	1950	Average, 1940–49
Corn (bu.)	103,759,000	109,098,000	107,906,000
Oats (bu.)	143,302,000	141,814,000	113,497,000
Tobacco (lb.)	23,576,000	31,434,000	32,968,000
Potatoes (bu.)	9,805,000	13,400,000	12,708,000
Barley (bu.)	6,633,000	8,979,000	9,930,000
Wheat (bu.)	1,856,000	2,084,000	1,912,000
Flaxseed (bu.)	150,000	155,000	142,000
Canning peas (lb.)	320,660,000	257,460,000	—
All tame hay (tons)	8,797,000	6,542,000	—
All clover and timothy (tons)	3,566,000	2,694,000	3,997,000
Alfalfa (tons)	5,021,000	3,516,000	2,372,000
Cherries (tons)	14,600	13,000	12,840
Cranberries (bbl.)	190,000	219,000	137,000
Apples (bu.)	710,000	740,000	729,000

Source: U.S. Department of Agriculture.

Manufacturing.—The total value of manufactured products in Wisconsin increased from $2,360,947,000 in 1949 to $2,687,346,000 in 1950. The most important industries in value of manufactured products in 1949 were machinery (except electrical), food and kindred products, paper and allied products, transportation equipment and fabricated metal products. In 1950 the estimated average number of wage earners in Wisconsin manufacturing establishments was 332,600 as compared with 312,900 in 1949 and 337,100 in 1948, while the average estimated weekly pay roll increased from $17,837,000 in 1949 to $20,752,000 in 1950. (C. L. L.)

Mineral Production.—Table II shows the tonnage and value of mineral production in the state in 1949 for commodities having values in excess of $100,000, and corresponding data for 1950.

Table II.—*Mineral Production of Wisconsin*

(In short tons)

Mineral	1950		1949	
	Quantity	Value	Quantity	Value
Iron ore	1,905,813	?	1,574,468	*
Lead	532	$ 143,640	857	$ 270,812
Lime	124,530	1,448,095	107,339	1,254,751
Sand and gravel	19,117,115	11,959,012	17,023,466	10,456,561

Wool. World production of apparel and carpet wools in 1951 was estimated to have been slightly greater than in 1950. Most of the increase was in apparel-type wools, the production of which increased about 105,000,000 greasy lb., or 3% over the year before. Record high prices and heavy demand had caused sheep growers in the major wool-producing countries to increase their flocks as much as possible. Economic conditions within the industry were, therefore, responsible for the increased wool-growing activity throughout the world. The principal wool-producing countries and the amount of wool produced by each are disclosed in the table.

World Wool Production

(greasy shorn pounds)

Country	1951	1950
Australia	1,087,000,000	1,116,000,000
New Zealand	380,000,000	372,000,000
Argentina	440,000,000	420,000,000
Uruguay	190,000,000	176,000,000
South Africa	240,000,000	230,000,000
United States	279,000,000	274,000,000
Total	2,616,000,000	2,588,000,000*
Others	1,466,000,000	1,357,000,000*
Grand total	4,082,000,000	3,945,000,000*
Apparel types	3,231,000,000	3,126,000,000*

*Revised.

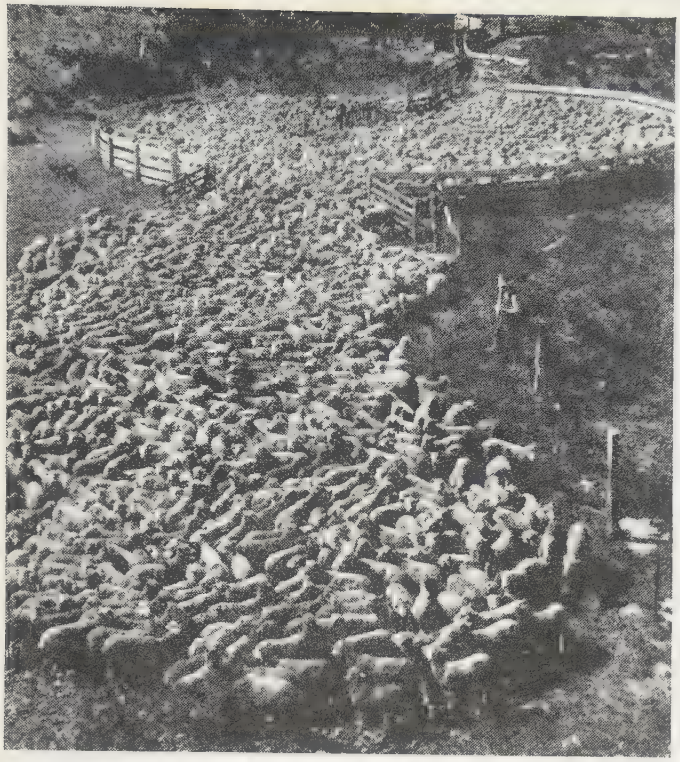
Source: Computed by the New York Wool Exchange from data released by the U.S. Department of Commerce and the International Wool Secretariat.

For the first time in five years consumption of apparel- and carpet-type wools was less than production. The average decline seems to have been about 15%, or nearly 700,000,000 lb., and the curtailment in the use of wool was apparent in virtually all consuming countries. This decline can be attributed to record high prices at which wool sold early in 1951. This development not only caused consumer resistance to 100% wool fabrics, but also was the contributing cause of heavy weights of synthetic fibres being blended with wools in order to keep clothing prices on a competitive level with other types of apparel cloths.

It was estimated that world wool production in 1951 exceeded consumption by between 200,000,000 and 300,000,000 lb. The carry-over of wools into 1952 was therefore greater by that amount on Dec. 31 than a year previously. It was the first year since World War II that apparel wool stocks throughout the world were not materially reduced.

In the United States, one of the major wool-consuming countries, inventories of finished goods and wool clothing were unusually large at the beginning of 1951, and the industry found it difficult to liquidate them. After the frantic wool buying and manufacturing activity in the months immediately following the outbreak of hostilities in Korea, much the same situation was apparent in many other countries.

In the first quarter of 1951 wool prices reached heights never before attained in the history of the wool trade. Fine Australian wools, which act as a world price barometer, rose to the unheard of level of $4.30 per clean pound in March, compared with $1.82 one year before, and wools in other producing areas of the southern hemisphere as well as in the United States and Great Britain recorded similar advances. Such a price level



SHEEP STRIPPED of their fleece being herded for dipping at a farm in Marlborough, N.Z., after the 1951 harvest

for apparel wool, however, quickly curtailed international trade in wool, with the result that prices fell precipitously until the reopening of the Australian auctions in September when the same fine wools were quoted at $1.65. One result of this price slump was to curtail wool buying almost entirely in the United States and to restrict it severely in Great Britain and Europe. Extreme caution became evident throughout the world, and wool inventories were difficult to move because civilian business was negligible and government procurement programs, particularly in the United States, became sharply curtailed. During the last quarter of the year, however, prices became firmer in Australia and elsewhere, as mills re-entered the market, although on a somewhat hand-to-mouth basis. Even this relatively small demand resulted in substantial price advances for wools, and at the close of the year Australian fine wools were quoted between $2.10 and $2.20 per clean pound. (*See* also Textile Industry.) (S. L. L.)

Words and Meanings, New.

English adds many new words to its vocabulary every year, some destined to live long, others to die soon. The words listed below, pertaining largely to 1950–51, are but a small residue of those collected by the committee preparing this article.

Several groups of the coinages below may be commented upon briefly. As usual, scientific and technological advances were well represented among the new words and meanings: witness "Bt," "citrovorum factor," "Compound F," "convertiplane," "hydroflap," "krotoscope," "lampshade," "Nike" and "pod plane." New terms like "brain washing," "depurgee," "Gibraltarism," "GI-X," "menticide," "multilateralism," "Reichsfront" and "Skylon" reflected the international scene. The U.S. scene was represented by a number of interesting coinages in fields from national politics to sport: for example, "chicken," "end money," "escalation," "gray mobilization," "I formation," "neo-isolationism," "roll-forwards," "whomp" and "WOC."

The words listed below became prominent or were seemingly used for the first time during 1950 and 1951. Dates within the parentheses following a word or definition indicate the first recorded use of the new word or meaning in the files of the committee.

A hyphen preceding the date means that the word or meaning is suspected of being older than the date given. If no date is given, the first record on file is 1951.

accommodator, *n. Specif.* A woman who performs part-time domestic services, such as helping out at a party.

Acthar. Trade name for the ACTH marketed by Armour & Co. (1950)

aeropause, *n.* That part of the atmosphere that exceeds an altitude of 75,000 ft.

ailurophile (Gr. *ailouros* "cat" + *-phile*), *n.* A lover of cats.

Air-Evac. Short for air evacuation, a service for flying wounded soldiers home.

avgas, *n.* **Av**iation **gas**oline. (1945)

big lie. Descriptive of a statement or of a conscious policy regarding statements containing a misstatement so great that it compels belief. (1948)

bird, *n. Mil. Slang.* A guided missile. (1948)

brain washing, *n.* A systematic procedure of indoctrination used in some totalitarian countries.

Bt. Tentative name of a B vitamin which may be necessary for growth of certain insects. (1948)

bug, *n. Slang.* A lottery. (1945)

certificate of necessity. A government authorization.

chicken, *n.* A game in which teen-agers in two automobiles drive straight toward each other. The driver who turns aside first is "chicken."

citrovorum factor. A new growth factor in the B-vitamin group, possibly beneficial in certain anaemias. (1950)

cobalt bomb. A foot-thick lead-walled cylinder with a small shuttered opening in one end, containing about an ounce of radioactive cobalt-60. It is used to treat cancer.

cold welding. A process of welding nonferrous metals by applying pressure. (1950)

Collator, *n. Specif.* An optical machine which, by superimposing a page of one copy of a text (for example, the First Folio of Shakespeare's works) on the same page of a second copy, speeds up collation, or comparison of the texts. (1950)

communize, *v. Specific.* To make the Russian-dominated Communist-party form of communism the basic government.

comparatist, *n.* One who studies comparative literature. (1946)

COMPO. **C**ouncil **O**f **M**otion **P**icture **O**rganizations. (1950)

Compound F. Hormone of the adrenal gland, with antiarthritic properties. Also called **hydrocortisone.**

convertiplane, *n.* A type of aircraft utilizing the principles of a helicopter in taking off and landing and those of an aeroplane during flight. (-1951)

cook, *v. t. Specif.* To make "hot" or radioactive. (1950)

cuddling, *n.* Broadcasting on a wave length very close to another wave length.

Dacron. Trademark of a washable, mothproof synthetic fabric very resistant to wrinkling. Originally known as Fiber V.

depurgee, (*de-*+*purge*+*-ee*), *n.* Term applied in occupied countries of Europe and Asia to one returned to political rights after being purged because of acts unfriendly to the Allies.

divarty, *adj.* Pertaining to **div**ision **art**iller**y**.

dump, *v. t.* To cause (a game) to be lost by dishonest play. **dumping,** *n.*

end money. Funds held in reserve in case the cost of the production of a film exceeds its budget.

escalation, *n.* The condition in which price is permitted to rise as costs rise. (1942)

Fiber V. (1950) *See* **Dacron.**

field, *v.* To equip and train (a soldier). (-1950)

Flying Crane. A jet-driven helicopter. (1948)

fly-past, *n. Brit.* Ceremonial parade of planes in formation. (1946)

fording kit. Device for waterproofing a tank to enable it to operate in water.

frogman. A member of an underwater demolition team. (1945)

GARIOA. Government and Relief in Occupied Areas. (1950)

Gibraltarism, *n.* Term applied to the view that the western hemisphere should be made as strong defensively as Gibraltar.

GI-X. Symbol of the millionth soldier killed in all U.S. wars since the first fell at the battle of Lexington, April 19, 1775.

Gleep. The nuclear reactor at Harwell, Eng.

global bomber. A long-range bomber.

gray mobilization. Semimobilization. (1950)

ground zero. That point on the ground which lies directly under a bomb explosion, such as that of an atomic bomb, and which is used as a focal point for various calculations. (1946)

hard core. The crucial or essential part. (1950)

hot, *adv.* Said of an aeroplane which must land at a high rate of speed. (1944)

hoverplane, *n.* A helicopter. (1950)

hydrocortisone. *See* **Compound F.**

hydroflap, *n.* A hinged flap on a seaplane which can be lowered into the water to keep the nose of a landing plane up, to act as a brake and to serve as a rudder. (1948)

hydro-jet, *n.* A theoretical jet-propulsion engine using sea water. (1946)

Hypo. High-power atomic boiler, a form of nuclear reactor. (1950)

I formation. *Football.* A formation in which the three backs line up behind the quarterback.

Influence peddler. One who seeks special privileges from the government for his clients. (1949)

Iron Triangle. A triangular defense area of the Chinese Communists in North Korea, whose points are Pyonggang at the north, Chorwon at the west and Kumhwa at the east.

JP-3. Jet-plane fuel.

krotoscope (Gr. *krotos* "handclapping" + *-scope*), *n.* An instrument for determining the amount of applause. (1950)

lampshade, *n.* A device, shaped something like a lampshade, about a foot in diameter at the bottom, which can determine in a very short time the height of an atomic airburst and ground zero (*q.v.*). Also called **radiation lampshade.**

Lopo. Lo-power atomic boiler, a form of nuclear reactor. (1950)

Matador, *n.* The B-61 pilotless bomber, a guided missile.

menticide, *n.* The gradual destruction of a man's mind, through psychiatric or other means, to the point where he will accept an ideology formerly loathsome to him.

Mig Alley. A rectangular area in northwestern Korea, some 30 mi. wide and extending about 70 mi. from Uiju on the Yalu river southeast to Sinanju, over which the U.N. air men encountered Chinese-piloted MIG-15 fighter planes.

multilateralism, *n.* The policy of balancing trade in terms of the world market. (1943)

NATO. North Atlantic Treaty Organization.

neo-isolationism, *n.* An isolationism in which military preparedness plays a part. (1950)

neo-orthodoxy, *n.* Term applied to certain re-emphases in theology, especially on original sin, the "wholly-otherness" and righteousness of God and the Bible as a source of revealed religious truth to which man must respond in every life situation by a decision involving obedience or disobedience. (–1946)

Nike. An anti-aircraft guided missile of the U.S. army.

Operation Killer. Code name of U.N. offensive in Korea.

Operations Research. An applied science which breaks down complex activities and operations into simpler parts. (1949)

paramedic, *n.* A doctor in the parachute service; a **paradoctor.**

petrochemistry, *n.* Petroleum chemistry. **petro chemical,** *adj.* (1950)

pod plane. An experimental aeroplane equipped with a detachable fuselage called a pod. (1950)

power net. Knitted nylon elastic. (1950)

primaquine, *n.* A synthetic chemical which, especially when administered with quinine, tests indicate may be an effective antimalarial. (1950)

privileged sanctuary. Phrase used by Gen. Douglas MacArthur to denote the area in Manchuria behind the Korean border where the Chinese Communists were immune from attack. (–1951)

protonsynchroton, *n.* A giant atomic accelerator. (1949)

quarterback, *v.* To direct. (1945)

radiation lampshade. *See* **lampshade.**

Reichsfront, *n.* A neonazi party in western Germany.

roadblock, *n. Fig.* A blockage, stopping. (1945)

roll-forwards (analogy of **rollback**), *n. pl.* Price increases.

semi-works, *n.* A pilot plant. (1949; 1938 in technical usage)

service mark. A mark, such as *Greyhound* bus, used to identify a service as a trade-mark is used to identify merchandise. (1945)

short-circuit, *v.t.* To pay (money) not to and through a treasurer but more hastily straight to another person by by-passing the treasurer.

Skylon, *n.* A structure which symbolized the Festival of Britain.

skysweeper, *n.* An anti-aircraft weapon, under development by the U.S. army, which is aimed by means of radar. (1950)

super-Schmidt, *n.* A telescope camera designed to photograph meteors.

sweptwing, *adj. Aeronautics.* Short for swept-back wing.

synoptophore, *n.* Instrument for correcting eye-muscle defects. (1946)

target date. Deadline; date set for completion of a project. (–1945)

telecon (radio-teletype conference), *n.* 1. A device of the U.S. army which transmits and receives teletype messages over long distances by means of radio or submarine cable and flashes them on a screen, thus making possible conferences between groups in widely separated places. 2. A radio-teletype conference. (1950)

thermonuclear, *adj.* Pertaining to the heat energy produced by or associated with change in the nuclei of atoms. (1942; 1939 in technical usage)

veepee, *n.* A vice-president. (1950)

whomp, *v.t.* To defeat decisively. (–1947; 1942 in British usage)

WOC (without compensation). A dollar-a-year man. (1950)

Zeep. The Canadian nuclear reactor at Chalk River. (1950)

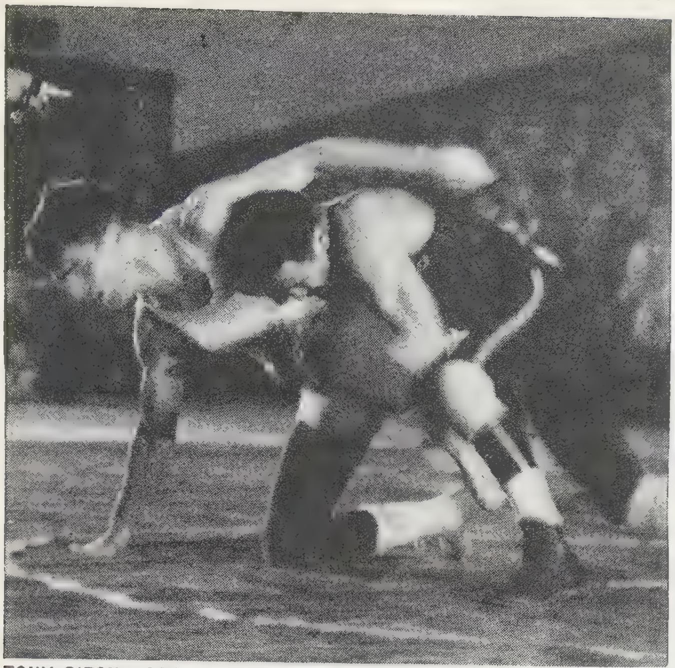
Wrestling.

Iowa State Teachers college became in 1951 the first team in the history of the Amateur Athletic union to win the wrestling championship three years in a row when it triumphed in the national title meet at Cedar Falls, Ia. The victors annexed three individual crowns as Gene Lybbert scored in the 128 lb. division, Keith Young triumphed at 155 lb. and Bill Smith at 165. Young and Smith were both defending titleholders. Other A.A.U. champions were George Creason, Long Island Grapplers, 115; John Lee, Harvard Varsity club, 121; Bill Armstrong, Oklahoma A. and M., 136; Bob Hoke, East Lansing, Mich., 145; Louis Holland, Laramie, Wyo., 175; Harry Lanzi, Toledo (O.) Y.M.C.A., 191; Carl Abell, Broadway (Cleveland, O.) Y.M.C.A., heavyweight.

Although successful in A.A.U. competition, the Iowa State Teachers were dethroned as team champions of the National Collegiate Athletic association as a record field of 133 contestants from 46 schools saw action at Lehigh university at



TONY GIZONI of Waynesburg college, Pa. (right), breaking the hold of Bill Borders of the University of Oklahoma, Norman, during the 123-lb. event of the 1951 intercollegiate wrestling championship matches held in Bethlehem, Pa. Gizoni, the defending champion, retained his title, 7–6

Bethlehem, Pa. Oklahoma captured the big prize with 24 points, one more than the total for the Oklahoma Aggies. Keith Young, the only defending champion in the big field, scored the only title triumph for the Iowa State Teachers, repeating in the 147 lb. group. Other N.C.A.A. victors were Anthony Gizoni, Waynesburg, Pa., 123; Walter Romanowski, Cornell of Iowa, 130; George Layman, Oklahoma A. and M., 137; Philip Smith, Oklahoma, 157; Eugene Gibbons, Michigan State, 167; Grover Rains, Oklahoma A. and M., 177; Bradley Glass, Princeton, heavyweight. Penn State was the top team in the eastern intercollegiate championships. (T. V. H.)

Wyoming. A Rocky mountain state of the United States, Wyoming was admitted to the union on July 10, 1890, as the 44th state. The name of the state, which means "mountains and valleys alternating," was derived from the Wyoming valley in Pennsylvania. Because of its pioneer work in woman's suffrage, Wyoming became popularly known as the "Equality state."

Wyoming ranks 8th in size and 47th in population among the states. The land area is 97,506 sq.mi.; water area, 408 sq.mi. The 1950 census, which gave a total population of 290,529, a 15.9% increase from 1940, listed rural inhabitants at 145,911 or 50.2% of the population of the state and urban at 144,618, or 49.8%. The 1940 census gave the population at 250,742 and listed 229,818 native white; 950 Negro; and 17,107 foreign-born.

The capital of Wyoming is Cheyenne, with a population (1950 census) of 31,935. Other cities having a population of 10,000 or more were: Casper, 23,673; Laramie, 15,581; Sheridan, 11,500; and Rock Springs, 10,857.

History.—Wyoming's 31st legislature convened on Jan. 9, 1951, and adjourned Feb. 17. It authorized the establishment of the Wyoming natural resource board with broad powers to develop the state's abundant natural resources. Civil defense legislation was enacted, and after studying the matter of sex crimes, a law providing for the disposition of persons so convicted was approved, and an act establishing juvenile courts became law. An oil and gas conservation measure was enacted and after lengthy consideration, oleomargarine legislation was passed. The legislature also approved a measure establishing a weather modification commission and providing for the control of cloud-seeding operations in Wyoming.

State officials during 1951 were: governor, Frank A. Barrett; secretary of state, C. J. Rogers; state auditor, Everett T. Copenhaver; treasurer, J. R. Mitchell; superintendent of public instruction, Edna B. Stolt. The state house of representatives elected in Nov. 1950 was made up of 17 Democrats and 39 Republicans, and the state senate consisted of 10 Democrats and 17 Republicans.

Education.—In 1951 there were 588 elementary and rural schools in Wyoming with 1,546 elementary teachers and 382 rural teachers, and a total enrolment of 45,720. There were 89 accredited high schools, with 945 teachers and an enrolment of 15,543. State expenditures on education for 1951 were approximately $16,131,600.

Social Insurance and Assistance, Public Welfare and Related Programs.—Funds spent on public welfare during the year ending Nov. 30, 1951, were as follows: old-age assistance $2,666,939; aid to dependent children $653,221; aid to the blind $59,852; general welfare $156,475; child welfare $36,566; general welfare health $340,208; aid to the permanently and totally disabled $254,982.

There were three correctional institutions with 412 inmates and appropriations (for the period April 1, 1951, to March 31, 1953) as follows: state penitentiary at Rawlins, 337 inmates, appropriations $434,870, capital outlay $10,000; girls' school at Sheridan, 30 inmates, appropriation $189,300, capital outlay $20,264; boys' school at Worland, 45 inmates, appropriation $222,575, capital outlay $8,000.

A home and hospital for the aged had been completed at the Hot Springs State park, Thermopolis. It was the only state-owned and state-operated home of this type in the United States. It was built at a cost of $600,000 (approx.) to accommodate 70 members and staff with additional hospital facilities for 20 persons. Appropriation (for period April 1, 1951, to March 31, 1953) was $150,000.

Communications.—During 1951 the Wyoming highway department let approximately 96 contracts for a total expenditure of $10,874,252 of which 16 contracts, for an amount of $191,296, were for special maintenance work and 15 contracts, amounting to $317,491, were for state-county co-operative projects. This work was spread over a total mileage of 635,273. The highway system in Wyoming at the end of the year consisted of 4,720 mi., of which 1,326 mi. were secondary routes. The 1951 maintenance budget, which covered the period ending Dec. 31, 1951, was set at $2,100,000. Railroad mileage remained stationary at 1,887.32 mi. There were 45 major airports in the state in 1951; and 76 Flying Farmer and private strips. Eight federal airways totalled 1,390 mi. On Nov. 1, 1951, there were 75,201 telephones.

Banking and Finance.—On June 30, 1951, there were 29 state banks with deposits of $74,520,740.94 and resources of $80,712,069.81. There were 24 national banks with deposits of $175,503,791.18 and resources of $187,954,559.41. There were 10 savings and loan companies with total resources of $20,939,867. Total state receipts for the fiscal year ending Sept. 30, 1951, were $50,190,271.33. Total disbursements for the same period were $41,542,134.03. The bonded debt for the state on Sept. 30, 1951, was $4,558,000.

Agriculture.—The total acreage harvested in 1951 was 1,942,000. Cash income from crops and livestock in 1950 was $146,285,000. There were no droughts, heavy rains or snows which had an unusual effect on crops in 1951.

Manufacturing.—According to the 1947 industrial census, the total estimated value added by manufactures was $34,957,000. The total employ-

Table I.—*Principal Crops of Wyoming*

	1951	1950	Average 1940–49
Corn, bu.	780,000	954,000	1,373,000

Table III.—*Principal Industries of Wyoming*

Industry	Value added by Manufacture, 1947
Petroleum and coal products	$18,363,000
Food and kindred products	7,834,000
Lumber and products	3,566,000
Printing and publishing	2,209,000
Stone, clay, etc.	1,489,000
Miscellaneous	1,496,000

ment at this time was 4,285, with total wages paid amounting to $12,291,000.

Employment.—The total labour force in Wyoming as estimated for May 1951, was about 118,500 workers, of whom about 56,331 were covered by unemployment compensation. Of the total force, approximately 28,000 to 29,200 persons were employed in agriculture, 9,800 in mining, 6,700 in contract construction, 5,500 in manufacturing, 13,160 in all types of transportation, 2,540 in utilities and communications, 3,280 in wholesale trade, 13,120 in retail trade, 1,800 in finance and real estate, 8,760 in the services, 2,040 in professions, 16,100 in all types of government and an estimated 4,500 to 5,000 in miscellaneous; 1,500 were unemployed.

(F. A. Bt.)

Mineral Production.—Table IV shows the tonnage and value of mineral production in the state in 1949 for commodities having values in excess of $100,000, and corresponding data for 1950.

X-Ray and Radiology.

The advantages of motion-picture photography of the fluorescent screen image had been recognized from the earliest days of the use of the X-ray in medical diagnosis, but the danger of prolonged X-ray exposure and the limited capacity of X-ray tubes had delayed full utilization of this method. Apparatus devised by R. F. Rushmer, R. S. Bark and J. A. Hendron was designed to overcome these difficulties. Their apparatus relies upon interrupting the generation of X-rays while the film is being advanced in order to avoid the necessity of closing the shutter on the camera. The time of X-ray exposure is thus shortened by about half.

The cinefluorographic apparatus was used to: (1) study changes in the outline of the heart during cardiac contractions; (2) make permanent records of the fluoroscopic appearance of the heart in congenital and acquired heart disease; (3) record movements of normal and abnormal joints; (4) study the impact of the left auricle on the oesophagus during a barium swallow; (5) prepare films for training students showing the fluoroscopic appearance of the heart; (6) study the heart and vessels during cardio-angiography following injection of diodrast.

The photofluorographic method—photography of the image on the fluorescent screen—was greatly advanced by the use of photofluorographic cameras constructed according to the principles of Schmidt, that is, reflector-type optics. A. Bouwers in the Netherlands produced a reflector-type camera with a resolution of five lines per millimetre—twice that provided by previously available cameras. This served to improve the clarity of photofluorographic images and render it more nearly equal to that of those produced by conventional roentgenography. Russell H. Morgan, at The Johns Hopkins university and hospital, Baltimore, Md., believed that photofluorography had reached the point of availability for use even in the wards of hospitals. Among its advantages over conventional roentgenography were its availability at the bedside and its relative low cost.

The relatively new method of angiocardiography—X-ray of heart and blood vessels—had been used to determine operability of lung cancer. C. T. Dotter, I. Steinberg and C. W. Holman reported 53 consecutive cases of lung cancer studied by this method. Their study furnished evidence that angiocardiography is a useful addition to other methods to determine operability of lung cancer. They concluded that "the effects of malignant tumors upon vascular structures are often characteristic and afford otherwise unobtainable preoperative information as to the extent of neoplastic involvement." Also that "The angiocardiographic signs of inoperability have in common the demonstration of neoplastic involvement of vascular structures beyond the limit of surgical resectability."

Investigations were made during 1951 to determine the suitability of cobalt 60 as a substitute for radium in the treatment of cancer. Co^{60} is a radioactive isomer with a 5.3-year half life. Since it can be produced at a much lower cost than that of X-ray machines with a comparable output of radiation, it was suggested as a substitute for such machines. I. Meschan and co-workers at the University of Arkansas, Fayetteville, reported during 1951 that a cheap, stable, readily available method for encasing pure cobalt wire had been devised, capable of filtering out the weak beta-rays from cobalt 60 without lessening the gamma-ray intensity. These cobalt 60 needles may be constructed at a fraction of the cost of equivalent radium needles. The authors also presented a method of standardization of cobalt needles against a national bureau of standards ampule of cobalt 60. They cautioned that until cobalt 60 radiation had been biologically standardized against radium it should be used only experimentally.

Chronic nonspecific inflammation of the lung with consolidation in the middle lobe of the right lung recently was classified as a definite disease. Prior to 1938, when A. O. Hampton and D. S. King pointed out that disease of the middle lobe may produce a triangular roentgenographic shadow, the condition was interpreted as interlobar effusion. They demonstrated that interlobar effusions are rare and that the shadow which had theretofore been interpreted as effusion was attributable to pneumonitis. R. C. Brock, in a careful study of the anatomy of the lungs, had shown in 1946 that not only the middle lobe bronchus but the bronchi of the upper and lower lobes of the left lung are liable to be compressed by enlargement of the many glands which surround them at their origin. Brock explained that obstruction is probably caused when a caseous gland adheres to the wall of a bronchus, ulcerates through it and discharges its contents into the lumen, when permanent stricture or obliteration follows. He believed that a damaged lobe or segment may remain silent for years and manifest itself because of infection later in life. The symptoms and signs of the "middle lobe syndrome" are identical with those of bronchogenic carcinoma, namely, haemoptysis, cough and pain. The common roentgenologic findings are calcified hilar lymph nodes and the characteristic triangular shadow of the atelectatic middle lobe. A report from the Mayo clinic and foundation, Rochester, Minn., supported Brock's observations that nonspecific pneumonitis and atelectasis may involve the left lung because of pressure upon a bronchus. W. M. Asche, J. R. McDonald and O. Clagett reported such a case in which the left upper lobe was consolidated and which resembled a superior sulcus tumour.

Evidence confirmed the conclusions of Carroll E. Palmer of the United States public health service concerning the origin of multiple pulmonary calcifications. A study of 114 cases was made by F. C. White and H. E. Hill at the Ray Brook, N.Y., state tuberculosis hospital. Palmer had concluded that the small, multiple, disseminated calcifications often disclosed on roentgenograms were not usually of tuberculous origin and that in most cases they were due to infection by *Histoplasma capsulatum*. The authors offered proof that the pulmonary calcifications found in their cases were due to an air-borne infection, probably *Histoplasma capsulatum* or a fungus antigenically related to it. (*See* also Atomic Energy; Standards, National Bureau of; Tuberculosis.)

CREW OF THE "NORSAGA" hauling the lines aboard in rough waters during the Royal Norwegian Yacht club's Hanko International regatta in July 1951. The "Norsaga" was entered by U.S. Ambassador Charles Bay

Yachting. The outstanding performance by a major racing yacht during 1951 was that of the 72-ft. yawl "Escapade," owned by Wendell Anderson of Detroit, Mich. "Escapade" made a clean sweep of the four major long-distance races on the Great Lakes, the Chicago-Mackinac, Bayview-Mackinac, Rochester and Mills Trophy races. "Escapade" was the first craft in the history of Great Lakes racing to take all four in the same season.

A transatlantic race from Havana, Cuba, to San Sebastian, Spain; the biennial transpacific race from Los Angeles harbour to Honolulu; and the British Fastnet race were outstanding ocean racing events of 1951. The first was won by the ketch "Malabar XIII," Kennon Jewett, owner, hailing from Miami, Fla. She made the 4,080-mi. passage in the good but not exceptional time of 28 days 26 min., and easily beat her three rivals, the schooners "Cubana" of Havana and "Sunbeam" of Miami, and the ketch "Gaucho" of Buenos Aires.

The Honolulu race went, on corrected time, to the smallest and lowest-rating yacht among 27 starters, A. L. McCormick's 35-ft. ketch "Sea Witch." Another small craft, Ira P. Fulmor's "Staghound," was second and Tucker McClure's "Chiriqui" third. The usual difficulty of the big yachts in this race, with fresh, fair winds most of the way, overcoming the big time allowances of smaller craft, was aggravated by several of them turning back to search for Ted Sierks, who had fallen overboard from the sloop "L'Apache" and who was saved by the U.S.S. "Douglas A. Munro" after 30 hr. in the water in mid-Pacific.

In the traditionally rugged Fastnet race 30 boats, under the flags of seven nations, started and within a day 14 of them were out of the race because of damage caused by a howling southwest gale. The sole U.S. entry, "Malabar XIII,'" was dismasted shortly after the start. The British sloop "Yeoman," Owen A. Aisher, was the winner, with a Dutch boat, C. Bruynzeel's "Zeevalk," second and the royal engineers' "St. Barbara" third.

In the winter "southern circuit," Harvey Conover's yawl "Revonoc" again won the Miami-Nassau race; James Crawford's ketch "Lady Patty" won the St. Petersburg-Havana and Ft. Lauderdale-Cat Cay events; Carleton Mitchell's yawl "Caribbee" won the Nassau trophy and Jacobs Cabassa's sloop "Larry" the Linton trophy. William Erwin's sloop "Belle of the West," though she won no single race, took the Florida Governor's cup as the high collective scorer of these races.

The feature of the biennial Newport-Annapolis race was a duel between the two big yawls "Baruna," Henry C. Taylor, and "Bolero," John Nicholas Brown. They finished 24 sec. apart at the end of 466 mi., "Baruna" winning on corrected time. C. Raymond Hunt won the Eastern Yacht club's New London-Marblehead race for the third time in his career, with the ketch "Zara." Palmer Langdon's sloop "Tiny Teal" took the Stamford-Vineyard race. Richard F. Nye's yawl "Carina" won the Marblehead-Halifax event. On the west coast 127 yachts sailed in the Newport, Calif., to Ensenada, Mex., international ocean race, with over-all fleet honours going to Barney Huber's 32-ft. sloop

"Mara" and class A to Don Ayres' yawl "Skylark." The Tri-Island series of distance races in the Puget sound area was won by Carl Jensen's sloop "Amorita."

An American six-metre team of "Llanoria," sailed by Magnus Konow; "Goose," Robert B. Meyer; and "Firecracker," Herman F. Whiton, defeated a British team off Cowes, Eng., in the first match for a new perpetual British-American cup. Another U.S. team racing abroad, from the Manhasset Bay (L.I.) Yacht club, lost to a Norwegian team in international class sloops at Hanko, Nor.

"Bolero" won the King's cup and George D. Haskell's eight-metre "Navigo" the Puritan cup, features of the New York and Eastern Yacht club cruises, respectively.

Massachusetts Institute of Technology, with Robert Nickerson and Howard Fawcett as its skippers, won the North American intercollegiate dinghy sailing championship for the seventh time in 15 years. A Seal Harbor (Me.) Yacht club crew headed by Jane Smith won the national women's sailing championship, and the national junior title went to a Rocky Point (Conn.) Sailing club crew headed by 17-yr.-old George Reichelm.

Many classes of small racing yachts held their national and international championships during the summer. Among the winning skippers in various classes were: Stars, E. W. Etchells, of Old Greenwich, Conn.; Thistles, Gordon Douglass, Painesville, O.; 110s, Lawrence Conover, Larchmont, N.Y.; Lightnings, John Tiegland, Jr., Spray Beach, N.Y.; Snipes (U.S. national), Francis Seavy, Clearwater, Fla.; 210s, John J. McNamara, Cohasset, Mass.; Comets, William Lyon, Corsica River, Md.; L-16s, Fred Lorenzen, Stamford, Conn.; Penguins, George Ruby, Balboa, Calif.; Ravens, Peter Geddes, Providence, R.I.

Yemen. An independent state in the southwestern tip of the Arabian peninsula, Yemen lies between Saudi Arabia, the British Aden protectorate and the Red sea. Area: *c.* 31,000 sq.mi. Pop. (1950 est.): 1,600,000. Language: Arabic. Religion: Moslem. Capital: San'a (pop. est., 25,000). Ruler: Sayf al-Islam Ahmad ibn Yahya.

History.—On Jan. 20, 1951, the Anglo-Yemeni agreement which had been negotiated in 1950 was published. By it diplomatic relations were to be established between Great Britain and the Yemen and a joint committee was to demarcate the frontier between the Yemen and the Aden protectorate and to settle past disputes. The British government was to assist the Yemeni government in its economic and social development schemes.

Previously, on Jan. 5, Talaat Ghossein, the director of publicity in the Yemeni foreign ministry, had announced in Cairo, Egy., on his return from Lake Success, N.Y., that the Yemeni government proposed building a state hospital and had bought a powerful radio transmitter and a printing press to combat illiteracy and to organize education by radio, and had approached the United Nations and the United States (under Point Four) for technical and other assistance.

Later in the year the government discussed the prospects of the granting of a concession for oil exploration in the kingdom with an Anglo-U.S. group and introduced a scheme for government marketing of the coffee crop which had hitherto been handled by Aden merchants.

During the summer the American Foundation for the Study of Man published a report on its two years of exploration of the ruins of Marib which had been the capital of the country up to A.D. 120.

(O. M. T.)

Finance.—Monetary unit: Maria Theresa dollar, called the riyal, nominally equal to 1 Indian rupee with an exchange rate of 4.76 riyals to the U.S. dollar.

Foreign Trade.—Trade with the U.K. (1950): imports £4,657; exports £801. Trade with the U.S. (1950): imports $62,674; exports $2,273,982. Main imports from the U.S.: machinery, cars and accessories, books, maps, etc. Main exports to the U.S.: cocoa, coffee and tea, hides and skins, petroleum and products.

Agriculture.—Main crops: wheat, barley, millet and coffee.

Yoshida, Shigeru (1878–), Japanese political leader, was born on Sept. 22 in Tokyo. He was educated at the Tokyo Imperial university, and graduated in law in 1906. He held many minor diplomatic posts in the far east and Europe and was second secretary at the Japanese embassy in Washington, D.C., in 1916–17. He was minister to Sweden, Norway and Denmark in 1928; vice-foreign minister, 1928–30; ambassador to Italy, 1930–32; and ambassador to London, 1936–39. Yoshida was arrested in June 1945 on allegations that he headed a "defeatist" peace faction. He was freed after Japan's surrender at the close of World War II, and became foreign minister in the Kijuro Shidehara cabinet, Oct. 6, 1945. In 1946 he accepted the presidency of the Japanese Liberal party and succeeded as premier on May 22.

On July 4, 1951, Emperor Hirohito installed a new Japanese cabinet, but Yoshida remained premier. In the reorganization he had sought to strengthen the economic elements of his regime preparatory to the forthcoming peace settlement. While signing this treaty at the peace conference in San Francisco, Calif., in September, Yoshida pointed out that it stripped Japan of 45% of its prewar territory and of vast overseas assets. He assured the conference that Japan would eventually assume full responsibilities in safeguarding itself.

Yugoslavia. A federal people's republic of southeastern Europe, Yugoslavia is bounded north by Austria, north and northeast by Hungary and Rumania, east by Bulgaria, south by Greece and west by Albania, the Adriatic sea and Italy. Area: (1940) 95,983 sq.mi.; (1947, incl. newly acquired territory of Julian march, Zara and the islands) 98,826 sq.mi. Federal republics (pop., 1948 census):

	Population	Capital
Serbia	6,523,224	Belgrade (388,246)
Croatia	3,749,039	Zagreb (290,417)
Slovenia	1,389,084	Ljubljana (120,944)
Bosnia and Hercegovina	2,561,961	Sarajevo (118,158)
Crnagora (Montenegro)	376,573	Titograd (12,206)
Macedonia	1,152,054	Skoplje (91,557)
Total	15,751,935	

By mid-1950 the total population was estimated at 16,250,000. Other towns (pop., 1948 census): Subotica (112,551); Novi Sad (77,127); Rijeka, formerly Fiume (72,130). Languages: Serbo-Croat, Slovene and Macedonian; Albanian, Hungarian and Italian spoken by minorities. Religions (1931 census): Greek Orthodox 48.7%, Roman Catholic 37.5%, Moslem 11.2%. President of the presidium of the people's assembly (*Skupština*), Ivan Ribar; prime minister, Marshal Josip Broz (Tito) (*q.v.*).

History.—During 1951 Yugoslavia's relations with the Soviet Union and the people's democratic satellites continued to be bad, and this hostility was reflected from time to time in frontier incidents. During the same period relations with the western countries steadily improved. Up to April 1951 Yugoslavia had received credits and grants from the United States to the amount of $190,000,000 and from Great Britain to the amount of £22,000,000. In June 1951 the United States, British and French governments agreed to make a joint grant of $50,000,000. On Nov. 14 an agreement was signed between the Yugoslav and U.S. governments by which the United States would grant military aid and would have the right to keep a small military mission with limited freedom of movement in the country.

Economic Planning. — The first officially published figures on Yugoslavia's foreign trade since World War II showed some interesting changes in its structure and its direction. The share of timber and timber products in Yugoslav exports rose from 21% in 1939 to 32% in 1950, of ores and metals from 10% to 23%, while the share of vegetable and animal products and foodstuffs fell in the same period from 46% to 23%. In imports the share of goods for industrial investment rose from 29% to 46%. In 1947 Yugoslavia's largest customers were the Soviet Union (16% of exports and 21% of imports) and Czechoslovakia (18% of both). In 1950 trade with these countries had ceased, and their place had been taken by the United States (13% of exports and 21% of imports), Great Britain (18% and 17%), and western Germany (12% and 16%).

On Dec. 28, 1950, the chief economic planner Boris Kidrić told the Yugoslav parliament that the government had decided to postpone until the end of 1952 the completion of the five-year plan. After that date there would be no more long-term plans. The aims of the plan were also considerably modified. Certain branches of engineering —for instance, the production in Yugoslavia of locomotives— were abandoned. It was admitted by officials that the planned output and refinement of oil could not be achieved. On the other hand electrification projects were increased even beyond the original aims. Kidrić told the Trade Union council in October that the main purposes of the plan, as modified, were to increase electric power resources and to expand the textile, mining and steel industries. Yugoslav industry still suffered from severe labour shortage during 1951. The measures of decentralization, undertaken already in 1950, aimed not only to give greater initiative to managers, who were made responsible for finding their own raw materials, machines and spare parts inside Yugoslavia or abroad, and were given greater freedom of choice both as to what their factories should produce and where they should sell it, but also to reduce administrative personnel and increase the numbers working at the factory bench or on the land. It was hoped to transfer the central planners and some members of superfluous regional planning staffs to administrative jobs in factories, to send skilled workers who had become clerks or administrators back to skilled jobs in the workshops, and to send some of the unskilled workers back to the land, where more labour was needed in certain regions.

YUGOSLAV WORKERS at a turbine plant as management of the government-built factory was being turned over to the nominal custody of employees. The change-over was part of a plan for a "withering away of the state" as authorized by law in June 1950

Peasantry and the Regions.—Relations with the peasantry remained difficult. During 1950 the pace of collectivization had been slow except in Macedonia, where the number of peasant households in collective farms increased by about one-third, and by 1951 60% of the peasants and 63% of the arable land were held by collectives. In the rest of the country the average share of arable land held by the socialist sector (collective farms and state farms together) was 26% at the beginning of 1951. In the most fertile grain-growing province of Vojvodina, however, it was as high as 50%. It was, however, clear both that the peasants were unwilling to be collectivized and that the collective farms were inefficient units. In particular, they were strangled by bureaucratic formalities, excessive clerical and administrative staffs, and had little incentive to increase their output. The country's food supplies, and its much-needed export surplus, thus depended on the 74% of private farmers. In the summer of 1951 the government attempted to grant incentives both to the collective farms and to the individual producers. On July 1 the compulsory deliveries to the government at low prices were abolished for meat, milk, potatoes and fodder, but not for cereals, fats, wool and industrial plants. On Aug. 9 all debts to the state incurred by collective farms for capital investment were cancelled. Pressure on peasants to enter collectives virtually ceased. This milder policy however encouraged the peasants to ask for more. Families who had been in a collective farm for three years began to claim their legal right to secede. Soon the demand for the break-up of collectives was strong enough to alarm the government. Official spokesmen, including Marshal Tito himself, while repeating that collectivization must be voluntary, attributed requests for secession to agitation by "the class enemy," and stressed that abandonment of "socialist agriculture" would not be tolerated. During September the formation of new collective farms in

Vojvodina and Slavonia was reported. In November a published directive of the Communist party announced that collectivization would continue, but that mistakes and abuses hitherto committed would be avoided.

The government made serious attempts to improve political administration and to end the abuses of power from which the peoples of Yugoslavia had suffered since 1944. In February the State Control commission, an institution copied from soviet practice, was abolished. A new civil code was introduced which contained specific provisions against arbitrary arrest and stressed the necessity for evidence other than confessions in the law courts. That these reforms were urgently needed and that the government intended to have them really carried out was shown by an astonishingly frank speech made by the minister of interior, Alexander Ranković, in June to the central committee of the Communist party. The minister described in detail the abuses committed and admitted that in 1949 no less than 47% of all arrests made by the police had been unlawful.

On Dec. 5 Archbishop Aloysius Stepinac, head of the Catholic hierarchy in Yugoslavia, was released after serving 5 of the 16 years' prison sentence to which he had been condemned in 1946. His status was not clear, as both the Vatican and he himself maintained that he was still archbishop while the government denied this. (*See* also Albania; International Bank for Reconstruction and Development; Trieste, The Free Territory of.) (H. S-W.)

Education.—Schools (1949–50): elementary 12,742, pupils 1,640,954, teachers 24,256; secondary 1,242, pupils 434,202, teachers 9,892; teachers' training colleges 69, students 21,917, teachers 787; technical schools 1,249, students 176,631, teachers 14,866; art, musical and dramatic schools 134, students 17,481, teachers 1,585; workers' educational colleges 81, pupils 5,854. Institutions of higher education: 79 faculties, academies and high schools, students 60,566, professors and lecturers 4,354. In addition, the national minorities were provided with 1,264 elementary, 151 secondary and 9 teachers' training schools.

Finance and Banking.—Budget estimates: (1950) balanced at 173,746,000,000 dinars; (1951) balanced at 172,662,000,000 dinars. Currency circulation (June 1951): 37,380,000,000 dinars. Bank deposits (June 1951): 91,770,000,000 dinars. Monetary unit: dinar, with an official exchange rate devalued on Dec. 28 from 50 dinars to 300 dinars to the U.S. dollar.

Foreign Trade.—(1950): imports 11,791,000,000 dinars; exports 7,930,000,000 dinars. Main sources of imports (1950): U.S. 22%; U.K. 17%; western Germany 17%; Italy 10%. Main destinations of exports: U.K. 19%; U.S. 14%; western Germany 12%; Italy 12%. Main imports: textiles 25%; ores, metals and products 14%; machinery and equipment 12%. Main exports: wool and products 33%; ores, metal and products 23%; vegetable products 15%.

Transport and Communications.—Roads (1950): 30,184 mi. Licensed motor vehicles (Dec. 1950): cars 12,000, commercial 20,000. Railways (1949): 7,223 mi. Shipping (merchant vessels owned over 100 gross tons, July 1950): 107; total tonnage 216,789. Air transport (1949): miles flown 490,769; passengers carried 33,998. Telephones (1949): 74,994 subscribers. Radio receiving set licenses (Dec. 1949): 299,055.

Agriculture.—Main crops (metric tons, 1951): wheat 2,358,000; barley 377,000; oats 315,000; (1950) rye 219,000; maize 2,081,000; potatoes 1,019,000; sugar, raw value 100,000; tobacco 17,000; dry beans 97,000; hemp fibre 30,000; sunflower seed 121,000. Livestock: cattle (1951) 5,236,000; sheep (1950) 10,042,000; pigs (1950) 4,287,000; horses (1951) 1,090,000; goats (1950) 786,000; mules (1951) 33,000; chickens (1951) 15,020,000; ducks (1950) 1,043,000. Wool production, greasy basis (1950) 16,000 metric tons. Wine production (1950) 3,300,000 hl.

Industry.—Manufacturing establishments (1948) 1,042, persons employed 254,000 wage earners and 74,300 salaried staff. Fuel and power (metric tons, 1950): coal 1,152,000; lignite 11,124,000; crude petroleum (1949) 62,600; electricity (1949) 2,186,000,000 kw.hr.; manufactured gas (1949) 27,000,000 cu.m.; natural gas consumption (1949) 8,000,000 cu.m. Raw materials (metric tons, 1949): manganese ore 4,300; pig iron 191,000; crude steel 399,000; copper 48,500; lead 56,800; zinc 8,800; bauxite 368,000; aluminum 2,400; chrome ore 41,900; molybdenum ore 200; antimony ore 2,800; magnesite 87,200; salt 108,900. Timber production (1950): sawn softwood 453,700 standards; sawn hardwood 635,900 cu.m. Manufactured goods (1949): cotton yarn (metric tons) 29,000; cotton and mixed piece goods 169,600,000 sq.m.; wool yarn 12,900 metric tons; woven woollen fabrics 27,900,000 sq.m.; cement 1,300,000 metric tons.

Yukon Territory.

The most northwesterly political division of Canada, the Yukon was created in 1908. Area: 207,076 sq.mi. Pop.: (1941) 4,914; (1951 census) 9,096.

History.—From the creation of the territory until early in 1951, Dawson was the capital; but on March 14 in the house of commons Robert H. Winters, federal minister of resources and development, announced that "the development of Whitehorse, together with its geographic position, have made it the centre of economic activity and communications for the territory." The change was vigorously protested by Dawson residents, but they could not overcome the effect of the population trend: Dawson (1941) 1,043, (1951) 773; Whitehorse (1941) 754, (1951) 2,548. The Yukon act was amended by parliament to increase the membership of the elective Yukon territorial council from three to five, and to permit the manufacture and importation of intoxicating liquor in the territory. The geological survey of Canada sent ten parties into the Yukon in 1951 to provide maps of mineral areas on the scale of four miles to one inch, based on vertical aerial photographs by the royal Canadian air force.

The workmen's compensation ordinance was revised to raise the percentage of compensation from one-half to two-thirds, and compensation became payable for specified industrial diseases. The Prisons and Reformatories act was amended to make remission earned by a prisoner by good conduct applicable to the Yukon. (C. Cy.)

Education.—There are three authorities in the educational administration. During 1951 the Yukon territorial government maintained ten schools with about 700 pupils and 31 teachers, the Indian affairs branch of the federal government maintained seven schools with 234 pupils and 12 teachers and the Roman Catholic Church had two schools with 118 pupils and 4 teachers.

Finance.—In the fiscal year 1950–51 the federal government collected revenue in the Yukon Territory totalling $1,846,793 and expended the sum of $5,626,640 for purposes of administration and development.

Transportation.—The White Pass & Yukon route railway runs from Skagway, Alaska, to Whitehorse, Y.T., a distance of 110 mi. Transportation to points in the interior beyond Whitehorse is afforded by the Yukon river and its tributaries. Freight and passenger service over the river system during 1951 were as follows: freight 8,751 tons, passengers 4,821.

Canadian Pacific Air Lines operates frequent service from both Vancouver, B.C., and Edmonton, Alta., to the Yukon. Charter operators provide services from bases at Whitehorse, Carcross and Dawson. Regular flights are made from Whitehorse to Mayo and Dawson twice weekly. Pan American World Airways provides service between Seattle, Wash., and Whitehorse on the Seattle-Fairbanks flight.

Furs.—Raw furs exported during the year ended July 31, 1951, totalled 228,616 pelts, compared with 151,969 during all of 1949.

Minerals.—Mineral production in 1950 was valued at $8,035,696 and included 93,339 fine ounces of gold, 3,202,779 fine ounces of silver and 12,865,518 lb. of lead.

Bibliography.—Florence Page Jaques, *As Far as the Yukon* (1951).

Zinc.

World production of zinc advanced regularly from the low of 1945 and in 1950 surpassed the war peak of 1943, making a new record high. The outputs of the major producing countries listed in Table I, as reported by the U.S. bureau of mines, accounted for about 93% of the total output.

Table I.—*World Smelter Production of Zinc*

(In thousands of short tons)

	1944	1945	1946	1947	1948	1949	1950
Australia	88.2	93.8	85.4	77.7	91.1	90.7	93.4
Belgium	9.6	12.9	95.0	146.7	169.6	194.6	195.4
Canada	168.5	183.3	185.7	172.9	196.5	206.0	205.0
France	9.7	9.3	33.5	50.7	61.2	66.8	78.8
Germany	286.2	?	31.3	22.8	45.6	95.8	124.3
Great Britain	79.6	69.5	73.4	76.5	80.6	71.8	78.7
Italy	—	1.7	17.3	25.1	29.1	29.3	42.0
Japan	69.0	20.4	12.4	16.4	23.4	35.6	54.0
Mexico	54.3	54.0	46.3	62.5	53.2	59.0	59.0
Netherlands	2.3	—	2.2	10.5	15.0	17.2	21.8
Northern Rhodesia	16.2	17.1	19.2	23.7	24.8	25.6	25.4
Norway	13.0	10.2	33.3	38.1	46.3	45.2	48.5
Poland	?	40.1	62.4	79.1	96.0	?	?
Spain	19.9	19.1	19.4	21.8	23.4	21.6	24.5
United States	869.3	764.6	772.4	802.5	787.8	814.8	843.5
Total	1,790	1,400	1,550	1,760	1,870	2,000	2,140

All countries except Germany surpassed or were closely approaching the prewar level of output, with the United States responsible for most of the subsequent increase.

United States.—Although the total mine output rose by 5% in 1950, smelter recoveries from domestic ores declined, but increased recoveries from imported ores more than offset the decline. Table II presents the salient features of the zinc industry in the United States, as reported by the U.S. bureau of mines.

Table II.—*Data of Zinc Industry in the U.S.*

(In thousands of short tons)

	1944	1945	1946	1947	1948	1949	1950
Mine production. . .	718.6	614.4	574.8	637.6	630.0	593.2	623.4
Smelter production. .	869.3	764.6	772.4	802.5	787.8	814.8	843.5
Domestic ores. . .	574.5	467.1	459.2	510.1	538.0	591.5	588.3
Foreign ores . . .	294.8	297.5	269.1	292.4	249.8	223.3	255.2
Imports	486.3	478.8	376.8	370.3	357.4	367.8	428.5
In ore.	422.7	381.7	272.1	298.0	264.2	241.2	272.5
Metal.	63.6	97.1	104.7	72.3	93.2	126.9	156.0
Secondary recovery .	345.5	360.4	300.7	310.8	324.6	237.8	326.0
Stocks.	298.5	328.6	269.2	149.3	116.7	176.0	69.2
Producers'	233.7	256.2	176.2	68.6	20.8	94.2	8.9
Consumers'. . . .	64.8	72.4	93.0	80.8	95.9	81.8	60.3
Consumption	888.6	852.3	801.2	786.4	817.7	711.8	967.1

While both domestic output and imports increased, the advance was not enough to meet a new record high in consumption, and stocks were reduced to a low level.

In the first seven months of 1951 the mine output totalled 506,145 tons, smelter output 546,598 tons and consumption 515,022 tons.

Canada.—The mine output of zinc rose from 288,262 short tons in 1949 to 312,585 tons in 1950, but the refined zinc output dropped from 206,045 tons to 204,959 tons. Exports in 1950 included 146,880 tons of metal and 129,561 tons of zinc in ore. (G. A. Ro.)

Zoology.

Ecology.—T. A. and Anne Stephenson, in the first of a projected series of six monographs on the life between tidemarks on all coasts of North America, dealt comprehensively with ecological and geographical relations of tidal zone plants and animals in the Florida Keys and noted that they were tropical, not subtropical.

Embryology.—An important step in clarification of the role of reproductive glands in controlling the differentiation of accessory sex organs was made by Etienne and Emilienne Wolff, who used a carefully shielded X-ray beam to destroy the testes or ovaries of embryonic chicks and ducks. The organs used as indicators were those that normally show a difference in males and females well before hatching: in ducks, the syrinx (organ of voice) and the genital tubercles; in both ducks and chicks the Müllerian ducts (oviducts). They found that both syrinx and genital tubercle were of the male type in castrated male and female ducks; hence they concluded that in normal development the body tissues of both sexes have equal possibilities for differentiation of these organs, but that in the female the ovarian hormone suppresses the growth and differentiation of syrinx and genital tubercle. In a somewhat similar way, the decline of the Müllerian duct in males is a consequence of suppression by the testicular hormone for, in castrated males and castrated females, both ducts continue to grow and differentiate up to the eighteenth day of incubation.

J. Piatt was able to secure additional evidence about the embryonic origin of several tissues in salamanders by the use of a naturally occurring lot of colourless embryos as hosts and donors in transplantation experiments. The transplanted cells were always clearly distinguishable from the pigmented cells of the normal hosts and vice versa in the reciprocal experiments. Thus, he was able to confirm earlier work that showed that head ectoderm was the source of the cranial ganglia and that neural crest cells gave rise to certain cartilages in the head, spinal ganglia, pigment cells, sheath cells and a considerable part of the dorsal half of the spinal cord. On the contrary, he found no evidence that sympathetic ganglion cells, to which a neural crest origin is often ascribed, were derived from the neural crest.

Experimental Zoology.—M. F. M. Osborne studied the flight characteristics of 25 insects and, in accordance with aerodynamical theory, derived general formulas for lift, thrust, and power when wing motion was specified. He found that the honey bee, using a wing beat of 250 per second, attained a velocity of about 2.5 metres per second (about 6.1 miles per hour) and a certain dragonfly (*Aeschna mixtra* Latr.), using a wing beat of 38 per second attained a velocity of 7 metres per second (about 17 miles per hour).

It had long been known that female ferrets reach a reproductive state as the days become longer in the spring. David Hart, by subjecting ferrets to artificial days, showed that the determining factor was not an increasing daily ration of light, but rather the ratio between light and dark that is effective (2 parts of light to 1 part of darkness) in inducing oestrus.

S. Zuckermann concluded, on the basis of new experiments, that it was probable that all the eggs which differentiate in adult mammals are derived from primordial germ cells already present in the ovary at birth; or, to put it in other terms, that no new source of eggs arises during growth and further development.

Evolution.—The journal *Evolution*, vol. V, no. 1 (1951), inaugurated a section, "Comments on Evolutionary Literature," that had value as a bibliographic aid. Tilly Edinger corrected an old and widely accepted error in showing that the illustrations published in the 19th century by O. C. Marsh and regarded as showing the reptilian proportions of the brains of the ancient fossil birds *Icthyornis* and *Hesperornis* could not have been based on casts of the cranial cavities of those birds. The specimens available to Marsh were either too fragmentary or too distorted to be used for that purpose. She concluded, on the basis of a restudy of the specimens, that the brains of these birds were much more similar to those of modern birds than had been thought heretofore.

Lucien Cuenot presented a detailed summary of a great range of evidence for evolution in both plants and animals and expressed his reservations about current interpretations of the mechanism of evolution in his book, *L'Evolution biologique: les faits, les incertitudes* (Paris, 1951). G. S. Carter made an able presentation of modern evolutionary fact and theory in his *Animal Evolution: A Study of Recent Views of Its Causes* (London, 1951). By far the most elaborate study in this field during the year was W. K. Gregory's two-volume work, *Evolution Emerging* (1951), with 5,500 splendid illustrations and nearly 5,000 subject entries.

General.—T. S. Hall edited an anthology of important original publications in biology beginning with da Vinci and extending into the 20th century. Sir Francis Darwin, using some letters not previously available, published *Charles Darwin's Autobiography* (1951). Rachel Carson's *The Sea Around Us* (1951), notable for quality of writing and accuracy of content, was reviewed favourably both by scientists and literary critics.

The American Society of Zoologists met in joint sessions with the American Association for the Advancement of Science in Philadelphia, Dec. 27–30, 1951. The increasing interest in the effects of radiations and in the use of radioactive tracer substances was reflected in 22 papers devoted to radiobiology.

A new journal, *Experimental Parasitology*, was started (Academic Press, New York). (*See* also Endocrinology; Genetics; Marine Biology; Palaeontology; Physiology.)

Hart, *Journal of Experimental Biology*, 28 (1951); M. F. M. Osborne, *Journal of Experimental Biology*, 28 (1951); T. A. and Anne Stephenson, *Journal of Ecology*, 38 (1951); L. S. West, *The Housefly: Its Natural History, Medical Impor-*

tance, and Control (1951); E. and E. Wolff, *Journal of Experimental Zoology*, 116 (1951); S. Zuckermann, in *Recent Progress in Hormone Research, 1951*, ed. by G. Pincus, 6 (1951). (G. P. DuS.)

Zoological Parks.—*Europe.*—Privately operated zoological parks conducted for profit gained in number all over Europe during 1951, particularly in the Netherlands, where four zoos maintaining general collections were opened, and a special establishment for the keeping of birds at Alphen aan den Rijn was much enlarged in both collection and enclosures. An animal hospital was constructed and put into service in the zoological garden at Antwerp.

The spread of foot-and-mouth disease into zoos in north and central Europe from rural areas was recorded, and the only countries considered free of this disease were Norway and the Republic of Ireland.

Visitors to zoological gardens on the continent showed a remarkable increase in spite of the opening of new zoos and improvements in old ones. The attendance in zoos in England, however, was reported much reduced. The management of the city zoo in Rome was constructing a seaside zoo where the emphasis would be on setting and the exhibiting of large groups of animals in aggregations according to the continent of their origin.

A small English language publication, *International Zoo-News*, appeared; Bent Jorgensen. Rönne, Denmark, was the publisher.

Australia.—The Australian zoos, principally the Sydney zoo, accumulated collections of native animals and sent them abroad for exchange. The first koalas exported from Australia since 1925 were placed on deposit in the zoo at San Diego, Calif.

Several additional prohibitions on the importation of animals into Australia were enacted; the severest one prohibited the entry of birds from anywhere beyond the continent.

North America.—The managements of zoos in the United States seemed to be extravagantly preoccupied in the accumulation of various kinds of monkeys, particularly apes. Forty-one gorillas were shown in zoos and private collections. During the year, the celebrated Bushman of Lincoln Park zoo, Chicago, and the very large and younger male gorilla at the zoo in New York city died. The record for keeping gorillas alive in captivity was still held by the zoological garden at Philadelphia, where the gorilla Bamboo, believed to have been born in Aug. 1926, was still living in 1951.

A number of private ventures, showing wild and domestic animals in settings especially appealing to children, sprang up in popular resort areas. These were known as deer parks and children's zoos.

A large and modern house with several innovations in its construction for the showing of monkeys was opened at Houston, Tex. At Denver, Colo., a large glass flower house was converted into a tropical bird house in which the birds have complete liberty, and may be viewed in their tropical setting by the visitors from informal walks and benches. An animal hospital and animal study building was completed and opened at the zoological park at Brookfield, Ill. There fundamental research in its various phases, and current medical and surgical problems would receive investigation and treatment.

The endeavour to bring the theories and principles of animals in nature beyond the precincts of the zoo itself and its limited number of visitors, was accomplished by several zoos in presenting programs on radio, both by standard broadcast and television; audiences of many millions of listeners and spectators were reached.

FILMS OF 1951.—*Animals of the Farm* (Carl F. Mahnke Productions); *Autumn, Bee City, Bird Paradise, Microbes, Ponds, Sea Zoo, Shore Birds* (Almanac Films, Inc.); *Biography of a Fish* (Sterling Films); *Elk For The Future* (Wild Life Films); *Grey Owl's Little Brother, Nature's Songsters, Not So Dumb, Song Birds of the North Woods* (Skibo Productions); *Monarch Butterfly Story, Seashore Life* (Encyclopædia Britannica Films Inc.); *Salmon, Life Cycle of the Sockeye* (Paul Hoefler Productions); *The Adventures of Willie Skunk, Two Little Raccoons* (Young America Films, Inc.); *The Story of a Frog* (United World Films).

(Ro. B.)

INDEX

The black type entries are article headings and cross references. These black type article entries do not show page notations because they are to be found in their alphabetical position in the body of the book, but they show the dates of the issues of the *Book of the Year* **in which the articles appear.** For example **"Bhutan 52, 51, 50, 49"** indicates that the article "Bhutan" is to be found in the *1952 Book of the Year*, the *1951 Book of the Year*, the *1950 Book of the Year* and the *1949 Book of the Year*. The reference **"Horses:** *see* **Livestock 52, 51, 50.** *See* **Horses 49, 48"** indicates that information on "Horses" is to be found in the article "Livestock" in the *1952 Book of the Year*, the *1951 Book of the Year*, the *1950 Book of the Year* and under the heading "Horses" in the *1949 Book of the Year* and the *1948 Book of the Year*. **All black type entries without dates indicate that the same entries appear in all the past five issues. Examples,** not **Advertising 52, 51, 50, 49, 48,** but **Advertising;** not **Abyssinia:** *see* **Ethiopia 52, 51, 50, 49, 48,** but **Abyssinia:** *see* **Ethiopia.**

The light type headings which are indented under black type article headings and cross references refer to articles elsewhere in the text (of this issue only) related to the entry listed in black type. The light type headings which are not indented refer to information in the text not given a special article. Those which show page references refer to this issue only. Those which refer to the article **Obituaries** are followed by the date of issue in which the obituary appears.

All headings whether consisting of a single word or more are treated for the purpose of alphabetization as single complete headings. Names beginning with "Mc" and "Mac" are alphabetized as "Mac"; "St." is treated as "Saint." All references below show the exact quarter of the page by means of the letters *a*, *b*, *c*, and *d*, signifying respectively the upper and lower halves of the first column and the upper and lower halves of the second column.
